Commerce of images

Although certain definitions of religion would like to portray worship and the contemplative life as devoid of anything so profane or secular as commerce, in fact, work, trade, and religion are often inseparable, and can even be indistinguishable. And no religion is without fundamental economic aspects. If commerce is broadly understood as any system of exchange in which goods, services, or capital act as a medium of human relations, it is not difficult to see how commerce also characterizes much religious behavior. Human traffic with the divine may be described as a commerce of sorts, and often precisely as a system of exchange in which human beings barter for goods and services that will enhance their lives. Images are often the coin by which the metaphysical economy of exchange is conducted with the gods or divine forces whose benefits may be acquired by the expenditure of moral or spiritual capital betokened by the image. In other

cases, images promote or facilitate consumption that is infused with religious meaning.

The food and incense offered to earth gods by a Chicago Chinatown grocer in the small shrine reproduced here (a) are propitiations, that is, inducements to blessing or favorable action. The food is not simply a form of literal sustenance, though the practice of offering food to ancestors and the dead is common in many religions. But in such cases, as with the earth gods of the Chinese American grocery store owner, the food symbolizes the giver's mindfulness and plea. The offering, in other words, betokens a desired relationship, not a mere material dependency. The gods, like the dead, do not wish to be forgotten. Remembering them curries their favor because it engages them in a deliberate relationship with the living. They respond benevolently not because they are paid to do so, but

(a) A small shrine with offerings of food and incense at a grocery store in Chicago's Chinatown in 1999. [Photograph by David Morgan]

(b) ABOVE. Nineteenth-century ex-votos for the Virgin Mary on a church wall in Vilsbiburg, Germany. [©José F. Poblete/Corbis] (c) RIGHT. Wooden prayer tablets with requests for favors from the gods for sale at a Shintō shrine in Kyoto, Japan. [©Catherine Karnow/Corbis]

out of their sense of gratitude to the human recognition of their needs or because of the respect they are due. Such an economy humanizes the otherwise unpredictable power of the divine. A world in which the devout can engage the divine in acts of civility is a world less hostile and inhumane. The earth gods invoked by the grocer's shrine respond by promoting the sale of food in a way that parallels their propitiation in rural China, where they could assist good harvests.

The practice of displaying thanks for healings and deliverance or posting petitions for such blessings is familiar in Roman Catholicism and Shintō. Small paintings (b) are commissioned and displayed in cathedrals by those who wish to thank the Mother of God for her intervention in difficult circumstances. Public displays of this visual form of thanks are an essential part of the ritual since they are a kind of reciprocation that recognizes the Virgin's benevolence. Catholic women often post their petitions and thanks to Saint Jude at his shrines or in shrine publications as part of seeking his assistance in overcoming obstacles. Shintō pilgrims who visit shrines and holy places, such as mountains in Japan, display their petitions on pieces of wood purchased and then deposited at the shrines (c).

In the later Middle Ages in Europe, Christians were able to procure time off from extended stays in purgatory for themselves or dead loved ones by purchasing indulgences, which were delivered as tokens on paper (d). Letters of indulgence were drawn up by ecclesiastical authorities and awarded to particular churches or religious orders, authorizing the sale of indulgences to those who visited shrines or churches where they might venerate relics or images and offer prayers. Indulgences were often associated with pilgrimage churches and offered lucrative benefits to the towns, orders, bishoprics, and the Vatican. Images and medallions were sold at pilgrimage sites as tokens of pilgrimage and as devotional items that were used in prayer and even enshrined for devotion afterward. Sales at religious festivals helped ensure local artisans of income and boosted local economies, as well as church coffers (e).

(d) RIGHT. A sixteenth-century woodcut flyer advertises indulgences to be purchased from John Tetzel, an indulgence seller. [©Bettmann/Corbis] (e) BELOW. Jörg Breu the Elder, *Sale of Indulgences*, c. 1530, woodcut. [©Art Resource, N.Y.]

Festivals such as Ramaḍān, Ro'sh ha-Shanah, Christmas, and Easter are commonly celebrated the world over by the sale of all manner of decorations (f). Muslims, like their Christian and Jewish counterparts, purchase inexpensive, brightly decorated items for domestic display (g). These objects are often mass-produced, but typically recall premodern forms of craft and handmade production. Highly decorative, they incorporate explicitly religious symbols and motifs that will encourage ritual mindfulness during the festival and support rituals of gifting that

(f) Top. Ramaḍān decorations for sale in 2003 in Beirut, Lebanon. [AP/Wide World Photos]

are common on the occasions of such holy days. Even daily devotional life finds a hearty place for artistic goods, as seen in two different African religious marketplaces, which show an Ethiopian Orthodox priest and lay persons patronizing image peddlers outside of a temple in Addis Ababa (h) and two Muslim men in front of a vendor's glass painting display in Dakar, Senegal (i). Consumption, therefore, is a familiar form of religious observance. Religious practices such as Vodou, which are perhaps most commonly experienced as forms of problem-solving by practitioners, rely on proprietors who create the material

culture of liturgy, ritual action, and petition that priests and laity purchase in commercial shops for later use (j).

Religion is market-friendly even among those traditions that criticize and seek to reform certain economic practices. By challenging and ultimately subverting the metaphysical economy of indulgences used among Roman Catholics, the renegade monk Martin Luther and the Reformation he led and inspired replaced it with an alternative economic system of belief. Arguing that God himself provided the means of redemption in a theology of substitutionary atonement, in which the debt of sin was paid for by the sacrificial blood of Christ's death, Luther rejected the believer's dependence on an economic relationship with the divine that was mediated by the ecclesiastical hierarchy.

Inspired by the success of Luther's use of print and the commercial viability of print production, Protestants formed tract and bible societies that published and distributed materials domestically and internationally, often as the cornerstone of their mission outreach (k). In effect, Protestantism tended to transform faith into the affirmation of a message that was inexpensively circulated on a vast scale as mass-produced information or "news." These printed items were often illustrated, since images both attracted consumers and effectively condensed information into economically viable forms of advertisement.

Advertisement was understood as a form of evangelism, as the mural painted by an evangelical sign painter in Los Angeles (l) clearly shows. The pithy, attention-grabbing image was accompanied by the richly visual language of the Bible to deliver its urgent message in a direct way.

The very efficacy of Protestantism's use of imagery in mass-produced media during the nineteenth and twentieth centuries encouraged the exploitation of biblical narrative as a form of mass entertainment. Cecil B. De Mille's sensational portrayal of the life of Moses in *The Ten Commandments* (1956) was not only a box office hit in the United States, but in several countries. The promotional poster reproduced here (m) advertised the film to Japanese viewers in a way that capitalized on the star power and charisma of the Hollywood commodities of celebrity and extravaganza.

Making work and religion indistinguishable is not a peculiarly Protestant habit. Islam anticipated the integration of work and belief by centuries. This is perhaps most assiduously practiced by the Mourides, a Senegalese Šūfi ethnic group that regards work as a spiritual practice par excellence. This attitude is strongly conveyed by the

A Japanese poster advertising Cecil B. De Mille's 1956 film *The Ten Commandments*. [Courtesy of the Billy Graham Center Museum, Wheaton, Ill.]

(n) An image of Amadou Bamba, a Mouride saint, on the wall of a hubcap shop in Dakar, Senegal, in 1994. [Photograph by Mary N. Roberts and Allen F. Roberts]

intermingling of the portrait of the Mouride saint, Amadou Bamba, on a wall of a hubcap shop in Dakar (n). Buying hubcaps at this store promises a special blessing to devout consumers. For Muslims and Christians, business is an ideal medium for religious practice because it carries belief into the heart of the daily world, infusing the most mundane acts with a transcendent significance.

ICONOGRAPHY: ICONOGRAPHY AS VISIBLE RELIGION [FIRST EDITION]

Iconography literally means “description of images,” but it also refers to a research program in art history that exposes the different meanings of images vis-à-vis the beholder.

WORDS AND IMAGES. Religious iconography defines a relationship between word and pictorial scheme, each of which follows its own logic. Visual forms are not discursive: they do not represent their message sequentially but simultaneously. While the meanings given through verbal language are understood successively, those given through visual forms are understood only by perceiving the whole at once. Susanne Langer, who argues for such a distinction in her *Philosophy in a New Key* (1951, pp. 79–102), calls this kind of semantics “presentational symbolism,” indicating that we grasp it not by reasoning but by feeling. From this basic difference it follows that word and image sometimes compete against each other and sometimes supplement each other. There is no universal law for this rela-

tionship; I shall illustrate some of the possibilities with examples from the history of ancient religions.

In ancient societies, the artist who shaped statues or carved stamps and seals was included among the artisans, a disparate group of producers who came to form a rank of their own. In Iran, as elsewhere, the three age-old social groups of priests, warriors, and peasants were joined in Parthian times (third century BCE–second century CE) by that of the artisans. But this new group was unable to elevate its status, as confirmed by the *Book of Ben Sira* (second century BCE). This text, which enumerates a list of craftsmen, acknowledges that without such skilled workers as the engravers of seals, the smith, or the potter, a city would have no inhabitants and no settlers or travelers would come to it. Yet, the writer points out, the artisans “are not in demand at public discussions or prominent in the assembly,” since the assembly needs the wise men who are engaged in study rather than manual labor (*Ben Sira* 38:24–39:5).

The low reputation of the artisans is also reflected in the anonymity of their work. Artists working on behalf of a temple, a palace, or a private customer became alienated from their work. Although Greek vases were presumably signed by their painters for the first time about 700 BCE, the majority of artists were still unknown in later times and remained dependent on their patrons. The carvers of the Achaemenid rock reliefs (Iran, sixth–fifth century BCE), for example, relied completely on the political visions and models of the imperial court and were obliged to create a visual legitimation of Achaemenid kingship. (See Margaret Root’s *The King and Kingship in Achaemenid Art*, Leiden, 1979).

Other trends of patronage can be observed with seals, stamps, amulets, and pottery. In Hellenistic Egypt, for example, the god Bes is represented in clay figures more often than the official and well-known Egyptian gods. The artisans in the provincial workshops obviously had to take into account the taste of private customers, who were looking for a deity able to avert evil powers and to protect men and women. The frightening appearance of Bes that the artisans shaped served as protection against such perils and met the demands of the laity (see Françoise Dunand in *Visible Religion* 3, 1985). The history of Greek vase paintings provides us with similar phenomena. While some paintings represent typically heroic attitudes toward dying, others display an unheroic, plebeian fear of death (see H. Hoffmann in *Visible Religion* 4, 1985–1986). Here the dependency on the court has been replaced by a dependency on citizens: the artisans were obviously serving civil demands and had to respond to changing social values. But in Egypt and Greece alike, the priests were scarcely able to control the artisans’ relations with their customers. If there existed a market for religious objects and if there were influential lay employers, then priests could be expected to lose control of this part of religion. To make the point in positive terms: craft products sometimes reflect a popular comprehension of religion and thus can be used to trace the rulers’ demands for political legitimation, on the one hand, and

citizens’ demands on the other. Yet, these materials have scarcely begun to be used for the study of political and civil conceptions of religion apart from the well-known priestly one.

Another factor should be noted: the scarcity of pictorial schemes. As there existed only a limited number of well-known stereotypes suitable for representing gods, we often find a certain break between image and inscription. A particularly dramatic example appears on a jar from Palestine (about 800 BCE), decorated with two figures similar to the Egyptian Bes (with feather crown, phallus, and crooked legs). An inscription declares: “I will bless you by Yahveh my [our] protector and his Ashera” (*Monotheismus im Alten Israel und seiner Umwelt*, edited by Othmar Keel, Fribourg, 1980, pp. 168–170). The pictorial representation of God of course violates the ban on images (*Ex.* 20:4), though this prohibition originally concerned cult statues (*pesel*) alone and was extended only later to a comprehensive ban on pictorial representation (Robert P. Carroll in *Studia theologica* 31, 1977, pp. 51–64). Nor does the chosen pictorial scheme fit the official literary conceptions of Yahveh. But this incongruity does not prove that inscription and image are disconnected. There were only a small number of pictorial schemes appropriate for the representation of sky gods. In the second and first millennia BCE, three main schemes were used: the figure of a seated old man with a beard, dressed in a long garment with a horn-crown on his head; the figure of a standing young man with a club in his right hand; and the figure of a wild bull (Peter Welten in *Biblisches Reallexikon*, 2d ed., Tübingen, 1977, pp. 99–111).

Here we obviously touch on a characteristic of all traditional imagery: it tends toward the most simple schemes, which will be evident to almost all beholders. We know that ancient Jewish literature was aware of these schemes. The psalms refer to Yahveh as a smiting god (*Ps.* 29, for example; see Othmar Keel’s *Die Welt der altorientalischen Bildsymbolik und das Alte Testament*, 2d ed., Zurich, 1977, pp. 184–197), while *Daniel* 7:9 refers to Yahveh as the old god. These schemes were welcome as textual symbols, but for visual form they were rejected by the priests and prophets. Nonetheless, images such as Yahveh as Bes may well have been a pictorial representation not admitted by priests and prophets, and in fact, the ban on images so poorly argued in the Hebrew scriptures should be carefully reviewed in this context of pictorial schemes.

Further examples will suggest other aspects of the relationship between word and image. In India the concretization of gods in images reduced their geographical universality and emphasized their local function (Heinrich von Stietencron in *Central Asiatic Journal* 21, 1977, pp. 126–138). In Greco-Roman religions, gods that originally belonged to the same tradition could be split by different representations (Hendrik Simon Versnel in *Visible Religion* 4, 1985–1986). These are only two instances where images have had an impact on the conceptual tradition. But we can also observe the

contrary: a ban on images in the literary tradition can deeply affect the pictorial representation. Medieval and modern Shī'ī Muslim artists usually paint their holy imams as men without faces; the incomplete and mutilated human figures testify to an image-critical tradition. In other cases, as in Munich in 1534–1535, a ban on images could result in full-fledged iconoclasm (*Bildersturm*, edited by Martin Warnke, Munich, 1973). Yet a thorough analysis of iconoclasm must pay close attention to the different functions these images have had: a political one in the case of state art, a civic one in the case of objects created by artisans for their fellow citizens, and finally, a sacerdotal one in the case of temple art. The destruction of rulers' emblems, the smashing of amulets, or the cleansing of the temple can all be justified by the same ban on images. But in fact each of these actions has its own rationale and must be described in separate terms.

APPROACHES TO ICONOGRAPHY AND ICONOLOGY. The study of iconography within the discipline of art history explores the symbolic references of pictorial representations. The first modern scholar to address such issues was Aby Warburg (1866–1929), who specialized in the art of the European Renaissance. Erwin Panofsky (1892–1968) proceeded to develop a comprehensive model for the description of pictorial arts based on three strata of meaning, each entailing particular analytical and terminological tools. According to Panofsky, the first level resides in the world of natural objects and events and is evident to every beholder. The second level, that of conventional meanings, can be detected in the motifs of works of art; it is the domain of iconography in the narrow sense of the word to identify these conventional meanings. Finally, there are underlying principles of *symbolic values*, in the sense defined by Ernst Cassirer, and he described the intuitive process of detecting them as *iconology* (see *Studies in Iconology*, pp. 3–31).

While Panofsky's design for reading images has been widely accepted, it has also been refined over time. Besides the Gestalt psychologists, the influence that Ludwig Wittgenstein (1889–1951) has exerted on the general theory of symbols has been felt in the field of iconology. In his *Philosophical Investigations* (1953), for example, Wittgenstein presents a figure that can be read as either a duck or a rabbit. What we see, he demonstrates, depends on our interpretation. In other words, there is no innocent eye; seeing is an active process, not a passive one. As recent research into pictorial representation emphasizes, the share of the beholder is decisive; the likeness between drawing and object is of minor importance. What might be called a critical rationalism of viewing dictates that when we read a drawing we are looking for stereotypes we have in mind already. This view, promoted most influentially by Ernst H. Gombrich (1977), implies that there is no clear-cut division between natural and conventional meanings as Panofsky maintained; reading images mainly involves the recognition of conventional schemes. Different cultures develop different schemes for identical objects; thus, we believe that we recognize likeness, but in fact we only recognize stereotypes well known in our

own culture. Once the viewer's role is seen to be greater than Panofsky allowed, new problems are raised. How can we describe the way other people see their images? How do we distinguish between subjective association and objective perception? Where do we draw the line between true and false inference?

A second criticism of Panofsky's original scheme has been advanced by George Kubler, who reproaches the seeming preference for words over images in *The Shape of Time* (1962). Separating forms and meanings, he argues that artifacts have to be studied as forms of their own; their development must be traced regardless of the meanings connected with them. By including architecture and sculpture along with painting, Kubler has also conclusively extended the field. He reminds us that images and symbols are not free-floating but regularly connected with particular art forms and that, conversely, art forms have an affinal relationship with images and symbols. This phenomenon can be described in terms of iconological genres: images and symbols, like literary concepts, became institutionalized in genres (see Gombrich's introduction to *Symbolic Images*, 1972). The art form (a coin, for example, or a vase) is the place where an artisan combines a functional object with symbolic values. The study of continuity and variety in the designs of these art forms, therefore, yields insights into symbolic values. This analysis of iconological genres seems to offer a much more controlled approach to iconology than the intuition that Panofsky had in mind, since it allows us to discern between true and false implications.

It is evident that no verbal description can enter into details as much as a visual depiction. This means that each text leaves a certain free play to the imagination of the artist, and the manner in which artists have used this freedom is in no way accidental. To cite one example, the first Christian artists working in the Roman catacombs depicted Jesus as the Good Shepherd with a lamb on his shoulders, a motif obviously inspired by *Matthew* 18:12–14 and *Luke* 15:4–7. But there was a change in meaning: while the parables emphasize the concerns of the shepherd for the individual gone astray, the artists of the third century depicted Jesus with a lamb on his shoulders to emphasize the value of protection in the "age of anxiety." Later on, as social values changed, other motifs were demanded (see Moshe Barasch in *Visible Religion* 2, 1983). This episode neatly illustrates the subject of Panofsky's iconology: an image—in itself an illustration of a story—can be explained as a reflection of the symbolic value of an age, and therefore changes in the representation indicate changes in basic attitudes.

Panofsky himself perceived the risks connected with his approach. There is always the danger, he observed, that iconology, which should relate to iconography as ethnology relates to ethnography, will instead parallel the relationship between astrology and astrography (*Meaning in the Visual Arts*, p. 32). This danger of excessive interpretation is due to the very ambiguity of images and to the difficulty of comparing

them. Every iconological statement must therefore be carefully argued and submitted to certain control. In the case of the history of Mediterranean religions and arts, two approaches appear to meet this fundamental demand, one focusing on styles, the other on the institutional function of images.

Changes of style. A comparison of art from early Egyptian and late Roman times immediately reveals certain changes in the means of depiction. The Egyptian mode, which Gerhard Kraemer has described as paratactical or preperspective (*Figur und Raum in der ägyptischen und griechisch-archaischen Kunst*, The Hague, 1931), can be seen on the famous Narmer Palette of about 2800 BCE. The details of the image are disconnected. Even the body is not a whole, for every part of it is depicted as an independent unit: head and legs are shown from the sides, eye and trunk from the front. The picture does not presuppose a spectator who perceives the depiction as a whole; rather, it tells a story by means of signs and symbols that are not interrelated. The visual and discursive systems of representation have not yet been separated: the visual does not evoke illusion, while the Egyptian system of writing represents discursive speech with pictorial symbols (see Herman te Velde in *Visible Religion* 4, 1985–1986). Only with classical Greek art does the depiction come to rely on an ideal beholder and deliberately evoke what we call illusion. These differences, of course, have nothing to do with skill or lack of it. More aptly, we should explain them in terms of a different *Kunstwollen*—a word used by Alois Riegl and only inadequately translated by “artistic intention” (Otto J. Brendel, *Prolegomena to the Study of Roman Art*, New Haven, 1979, p. 31). If one accepts the notion of *Kunstwollen*, however, the different artistic intentions remain to be explained.

At this point Panofsky again becomes useful because he looked for the symbolic values underlying artistic products. In this case, the change from paratactical to hypotactical (or perspectival) art can be analyzed as a change in worldview. By the fifth century BCE in Greece, an archaic conception of person and nature lacking the notion of organic coherence had been replaced by one stressing the organic interrelationship of different parts. Later on, in Hellenistic and Roman times, this organic conception of person and nature was replaced by yet another one stressing mechanical order. The individual object (a statue, for instance) then became part of a spatial scheme submitting different constructions and objects to a superior artificial order. The arrangements of space in late Roman art not only evoke military order but also reflect the values of a bureaucratic society that succeeded in crushing the civil structure of the *polis* (Hans Peter L’Orange, *Art Forms*, Princeton, 1965). There exist only a few of such large-scale comparisons of styles, but they are sufficient to prove the value of such an approach, and similar cases could be made for other cultures.

Genres. A second iconological approach describes and compares images as reflections of certain principles of deco-

rum. Free-floating symbols can be assigned various meanings, but this variety will become more limited if symbols are regularly associated with specific art forms. The use of an object clearly influences the beholder’s perceptions and associations: function guides the projection that the beholder makes. This phenomenon is also familiar from literature, where the reader’s expectations are shaped by literary genre. The same holds true for visual representations: an image of a god on a coin evokes other associations than those summoned by the same image on an amulet: whereas the coin conveys political legitimacy, the amulet is associated with personal feelings of veneration. Thus, only by studying genres are we able to specify meanings, and only by studying institutional contexts can we discern between the true and false implications of images.

There are basically two theoretical models that can be invoked to explain the meaning of pictures: images can be read as elements of a structure, and they can be read as models of social reality. The two main theories of symbols, namely those of Claude Lévi-Strauss and Ernst Cassirer, are also used in the field of iconography. For Lévi-Strauss, the meanings of symbols are based on their own logical interrelationships, while for Cassirer, symbols provide a conceptual means to grasp reality.

These approaches can be illustrated with recent scholarship on Greek material. Herbert Hoffmann has studied the paintings on Greek vases as structural codes. The scenes on the vases illustrate myths, but these illustrations can be read as paradigms referring to social values. Death, for example, is sometimes represented as the monster Gorgon whom the hero courageously encounters, and sometimes it is represented as an ugly demon pursuing human beings. Behind the choice of different mythological themes hide two distinct conceptions of death, one heroic and the other plebeian (*Visible Religion* 4, 1985–1986).

An approach more in the line of Cassirer is used in Wiltrud Neumer-Pfau’s study of possible links between Hellenistic Aphrodite statues and the social position of women. Such links are not unlikely, because ancient physiognomic literature postulated a connection between body posture and the moral qualities of the person depicted. In fact, the posture of the Aphrodite statues changed in the course of time. In the early Hellenistic period the nude Aphrodite is shown reacting to an unseen beholder who has disturbed her; thus the spectator looking at the beautiful nude woman is freed from feeling any guilt. Later statues portray the nude goddess as less shy and modest: she allows the invisible beholder to admire her. Finally there are statues showing the goddess frankly exposing her nude beauty to the spectator. The moral qualities ascribed to the subject have gradually changed, and this change cannot be isolated from the fundamental impact that ancient Near Eastern culture had on the social and legal position of women in the Greek world. While women were under male tutelage in ancient Greek society, they enjoyed a certain independence in Egypt and the Near East. Thus the

change of visual representation reflects the change of social reality. (See Neumer-Pfau, *Studien zur Ikonographie und gesellschaftlichen Funktion hellenistischer Aphrodite-Statuen*, Bonn, 1982).

These two theoretical models are valuable tools for enlarging scientific knowledge about past and foreign cultures. Iconography as a description of how other cultures read their images enables us to reconstruct hitherto undiscovered aspects of ethos and worldview.

H. G. KIPPENBERG (1987)

ICONOGRAPHY: ICONOGRAPHY AS VISIBLE RELIGION [FURTHER CONSIDERATIONS]

Since 1988, discussions related to the topic of iconography as a form of visible religion have expanded the boundaries previously established by Ernst Cassirer (1874–1945), Ernst Gombrich (1909–2001), Suzanne Langer (1895–1985), Erwin Panofsky (1892–1968), and Aby Warburg (1866–1929). The forms and directions of research questions have been re-shaped and re-formulated as the study of religion has been effected by the widening boundaries of gender studies, investigations of the body, and the study of economic, ethnic, engendered, and/or racial minorities. The study of art, ranging from art history through theories of appreciation, aesthetics, and art criticism has been expanded similarly to incorporate material culture, popular culture, and visual culture. The growing recognition among religious scholars of the significance and meaning of the iconographic elements in film, television, video, photography, and the mass media was prompted by the studies of Lynn Schofield Clark, Gregor Goethals, Stewart M. Hoover, Nissan N. Perez, and S. Brent Plate. New scholarship has extended the study of art and religion into geographic areas previously investigated to a lesser extent, such as Pre-Columbia, Latin America, Africa, and Oceania, as for example in the work of Carol Damian, Rosalind I. J. Hackett, and Albert C. Moore.

Interest in response theory (especially in relation to the arts) has affected the attitude toward and methodologies for the study of iconography. Attention in the last ten years has been placed on the religious valuing and influence of popular culture, and more recently, visual culture. These appear in the work of art historians such as Jeffrey F. Hamburger, Sally Promey, and Gary Vikan, and among religion scholars such as Erika Doss, Colleen McDannell, David Morgan, and Stephen Prothero. They have begun a transfer of interest from the traditional focus of iconographic analysis to new categories of engagement. Simultaneous to these renovations, reappraisals of the theories and methods developed by Cassirer, Gombrich, Langer, and most especially Panofsky, have re-framed the fundamental starting points for analysis.

NEW PERSPECTIVES. As linguistic analyses and technology advance our understanding of the epistemological and aesthetic processes, future directions for the study of iconography as a form of visible religion will emerge in coordination with a growing recognition of global and multicultural discourses as pioneered in the comparative studies of traditional iconographic motifs by Helene E. Roberts. New modes of analyses will incorporate nonlinear patterns of thinking as initiated in the “visual thinking” of the philosopher Rudolf Arnheim and the creative linguistics of physician Leonard Shlain. Further, the studies of the significance of optics and vision as communicators of cultural values and ideas in the recent work of art historians James Elkins and Martin Kemp will impact the study of iconography as a form of visible religion.

The rapid transfer of information via visual global media raises new questions regarding the communication of information, knowledge, and ideas beyond the traditional boundaries of cultural and religious frames. The need for developing a methodology that incorporates globalism, multiculturalism, and modern technology will become more apparent, and hopefully filled in conjunction with the development of a language to discuss the visual. Similarly, the continuing study of the visual codes of traditional cultures, especially among indigenous peoples, provides the necessary foundation for current and future study significantly expanding the field of religious studies.

DIANE APOSTOLOS-CAPPADONA (2005)

ICONOGRAPHY: TRADITIONAL AFRICAN ICONOGRAPHY

Africa is enormous, and the diversity of peoples and complexities of cultures in sub-Saharan black Africa warn against

generalizations, especially when discussing visual images, the significance of which is inextricably linked to local religious and aesthetic sensibilities. Hence, in order to understand the iconography of traditional African religions, one must use a comparative approach. Only by examining the religious iconography of a variety of cultures can one fully understand how visual images represent distinctive ways of experiencing the world for the peoples of sub-Saharan Africa.

ANCESTORS AND KINGS: TWO CASE STUDIES. On the granary doors of the Dogon people of Mali, rows of paired ancestor figures called *nommo* stand watch over the precious millet stored within. Similar figures, at times androgynous, are placed next to the funeral pottery on ancestral shrines of families and on the shrine in the house of the *hogon*, the religious and temporal leader of a clan. Their elongated, ascetic bodies and proud, dispassionate faces image the Dogon's myths of origin, as well as their perception of themselves when life is filled with spiritual vitality, *nyama*.

Oral traditions recall a great drought in the fifteenth century that occasioned the migration of the Dogon in two successive waves from southwestern regions to the area of the Bandiagara cliffs and plateau. There they displaced the Tellelem people, whose shrine sculpture they retained and used, and established themselves in small villages, often situated in pairs. In an environment largely devoid of permanent watercourses, the Dogon dug wells to great depths, cultivated subsistence crops of millet, and fashioned houses, shrines, and granaries of a mud-masonry architecture using the geometrical forms, such as cylinders, cones, and cubes, that can also be seen in Dogon wood sculpture.

The Dogon trace their descent to the "four families" who made the legendary migration, but this history of origins is inextricably intertwined with an elaborate creation mythology which profoundly informs their social and religious life. The variations in the myth, as in the sculptured forms expressing it, reflect the strong sense of individuality that each Dogon village possesses. It also permits the free play of the sculptor's imagination, whose work then generates new mythological interpretations.

Dogon myth, ritual, and iconography express a view of life in which, through a process of differentiation and pairing of related beings (*nommo*), an ordered, fruitful world is to be created. But the creative process of complementarity, or twinning, contains within it the potential of opposition and conflict. The primordial being, or *nommo*, who was a blacksmith, stole iron and embers from the sun and descended to earth within a well-stocked granary. It was he who led the descendants of the eighth *nommo* in civilizing the earth. Thus creation involves human participation through ritual actions that restore life and maintain an ordered world. Among the materials of the ritual process are village shrines representing a set of twins; shrine sculpture, as well as granary doors with their bas-relief of paired figures, snakes and lizards, zigzag patterns, and female breasts, all symbolically associated with the creation myth; geometric patterns or

"signs" on shrine walls, which refer to the basic ontological properties of the world; funerary masquerades and dances through which the deceased is transformed into a venerated ancestor; and secret languages through which the incantations and texts describing the creation of the world and the appearance of death are conveyed from one generation to another. These are the means by which the Dogon can act effectively in their world, strengthen the creative process, and at the very least provide a momentary stay against confusion.

Among the Edo people along the coastal forest of southeast Nigeria, the iconography of the Benin kingdom reflects a culture with a very different spirituality, one shaped by a monarchical tradition. The present dynasty traces its origins to the fourteenth century, beginning with Oba Eweka I, who was fathered by *Ọraṅmíyáń*, son of *Odùduwà* (*Odua*), the Yoruba creator-god and first king of Ife (although, according to oral tradition, even before Eweka, the Benin kingdom was said to have been ruled by the *Ogosi* kings). Thus, for centuries the political and religious life of the Edo people has focused upon the person and powers of the *oba*, or king.

The magnificently carved ivory tusks projecting from the top of the bronze memorial heads on the royal ancestral shrines (until the British punitive expedition of 1897) symbolized the powers of the king—his political authority and his supernatural gifts. While his authority depended upon statecraft and military conquest, it was by virtue of his descent from *obas* who had become gods and his possession of the coral beads, said to have been taken from the kingdom of *Olokun*, god of the sea, that the *oba* had *ase*, "the power to bring to pass," the power over life and death.

Over the centuries the royal guild of blacksmiths created more than 146 memorial bronze heads of deceased *obas*, queen mothers, and conquered kings and chiefs; and the royal guild of carvers portrayed on 133 ivory tusks the king, his wives, chiefs, and retainers, as well as leopards and mudfish, emblems of his power over forest and water and of his ability to move across boundaries distinguishing disparate realms. Although the memorial heads and the carved tusks were created in honor of particular *obas*, and the rites that are performed before them are always in the name of an individual *oba*, the bronze heads and carved figures do not portray the individuality of past *obas* in either form or expression. It is an aesthetic and a religious principle in Benin culture that the particular is subordinated to the general. The reigning *oba* depends upon the collective royal ancestors and yields to their commands, and the same is true of the iconography of the ancestral shrines and ritual artifacts of the Edo people generally. Thus, the ancestral shrines and their sculptures are not merely memorials but also serve as a means of communication with the living dead.

As in most other African religious traditions, the Edo distinguish between a high god, *Osanobua*, and a pantheon of deities that includes *Olokun*, god of the sea and bestower of wealth, *Ogun*, god of iron, and *Osun*, god of herbal leaves, whose shrines and rituals articulate the religious life for king

and commoner as one of response to the powers upon which individuals are dependent but over which they have relatively little control. However, in a monarchical society, with its divisions of labor among craftsmen, hunters, farmers, warriors, and traders (with the Portuguese, Dutch, and British) and its high regard for individual enterprise and prowess, the Cult of the Hand, *ikegobo*, also known as *ikega*, provides a means for celebrating the ability of the individual to accomplish things and, within limits, to achieve new status. Containers for offerings to the Hand, crafted in bronze for kings and in wood for titled persons, bear images of power such as an *oba* sacrificing leopards, a warrior holding the severed head of an enemy, Portuguese soldiers with guns, or the tools and emblems of office for the blacksmith, carver, or trader. All shrines for the Hand bear the image of the clenched fist, showing the ventral side, with the thumb pointing upward and outward. The directness with which the ritual symbolism is expressed is unusual in African religious art but quite consistent with a ritual of self-esteem.

FORM AND MEANING. Notwithstanding the particularity of traditional African iconography, it is, in general, essentially conceptual and evocative. It is not representational and illustrative, and it is not abstract.

Although the principal subject of African art is the human figure, there is rarely any concern to portray individual likeness, even where a sculpture has been commissioned to commemorate a particular person, as in Akan funerary pottery, Yoruba twin figures, or, as noted above, the Benin bronze heads on royal ancestral shrines. And there is rarely any attempt to visualize in material form spiritual powers, although an elaborately constructed masquerade of cloth, wood, and raffia or a sculpted figure on a shrine may “locate” for ritual purposes the ancestral presence, the god, or the spirit. Rather, African iconography is primarily concerned with expressing the essential nature and status of those powers to which one must respond and with providing models of appropriate response to such powers.

Presence of power. Among the *Ìgbómìnà* Yoruba of southwestern Nigeria the costumes of the masquerades for the patrilineal ancestors, *egun* *paaka*, combine materials of the forest with those of human manufacture, such as layers of richly colored cloths, bits of mirror, and beaded panels. The carved headdress portion often melds animal and human features. Packets of magical substances are secreted within the costume. It is the peculiar state of being of the living dead, who cross boundaries and move between two realms, who dwell in heaven yet profoundly affect the well-being of the living, that is materialized, for masquerades are created to reveal a reality not otherwise observable and to evoke an appropriate response, such as awe and dependency, on the part of the observer. Thus, among the Pende the concept of *mahamba* signifies an object, such as a mask, or a ritual given by the ancestors to the living for the common good and through which the ancestors periodically manifest themselves and communicate with their descendants.

A similar observation may be made about the reliquary figures of the Kota people of Gabon. Referred to as *mbulungulu*, “image of the dead,” the two-dimensional figures consist of large ovoid heads above simple, diamond-shaped wooden bases. On a shrine, the sculptured form is seated in a bark container holding the bones of several generations of ancestors. The ovoid face and coiffure are created by applying thin sheets or strips of brass and copper to a wooden form in a variety of interrelated geometric patterns. In every case, it is the power of the eyes that holds and penetrates the beholder, expressing the bond between the living and the deceased and the protective power of the ancestors in and for the life of the extended family.

It is not only the reality of the ancestral presence that Africa’s religious art presents. Among the *Ègbá*, *Ègbádò*, and *Kétu* it is the power of “our mothers” that is celebrated in the spectacle of the *Èfẹ/Geleşẹ* festival of masquerade, dance, and song at the time of the spring rains. “Our mothers,” *àwọn iyá wa*, is a collective term for female power, possessed by all women, but most fully by female ancestors and deities and by elderly women in the community who are thus able to sustain or inhibit the procreative process and all other human activities upon which the entire society depends. Balanced on the heads of the dancers—for they always appear in pairs—are sculptures depicting the composed face of a beautiful woman, above which there may be a dramatic scene of conflict between snakes and a quadruped, or scenes depicting domestic activities or social roles. The total sculpted image is perceived as a visual metaphor, often understood as having multiple levels of significance. Likewise, in the deliberate pairing of the delicate face masks and the massive forms and aggressive imagery of zoomorphic helmet masks of the Poro society among the Senufo people of the Ivory Coast one also observes images that refer to the complementary roles of female and male, both human and spiritual, by which life is sustained. In these masquerades, as in Kuba helmet masks worn by the king, African artists are not concerned with the representational illusion entailed in copying nature. Rather, they concentrate on that which they know and believe about their subjects, and they seek to construct images to which the distinctive spirituality of a people can react.

This is also true of emblems of office, such as the beautifully carved bow stands owned by Luba chiefs. The bow stands are considered sacred and are usually kept with ancestral relics, where only the chief and special caretakers are permitted to see them. The work images Luba political and spiritual power. It is through the maternal line that chiefs inherit their office. In the sculpted female figure at the top, woman as genetrix is conveyed in the lifting of the maternal breasts, the elaborately scarified abdomen, and the exposed genitals. The closed eyes of the serene face convey the inner, cerebral power that contrasts with the reproductive and nurturing power of her body. And the soaring three-pronged coiffure, expressing her status and beauty, repeats as an inverted pattern the sculptural treatment of the breasts and the legs, each

of which frames a central vertical element. On ritual occasions, the chief's bow and arrows, signs of his political authority, would rest in her elaborate coiffure at the top of the staff. Below her, the metal tip of the staff is thrust into the earth, the realm of the ancestors. It is maternal power that provides the link with the ancestral power on which a Luba chief's power depends.

Models of response. Ritual sculpture provides not only images of the powers on which the living depend but also models for appropriate response to gods and spirits. The naked male or female with arms at their sides or touching their abdomens which appear on Lobi shrines in Burkina Faso, as well as the figure of a kneeling woman with a thunder-ax balanced upon her head and holding a dance-wand for the Yoruba god Saṅgó, are images of man and woman as devotees, as inspirited and powerful. They are images through which persons see their spirituality and by which their spirituality is deepened.

The distinction between imaging the nature and status of spiritual powers and imaging the religious self in the posture of devotion and power cannot in most instances be clearly drawn: much African iconography combines the two processes, less so perhaps where there are ancestral associations and more often where the reference is to gods and spirits. On the shrines of the Baule people of the Ivory Coast, men and women place figures representing the spouse that they had in the other world before they were born. The figure is thus the locus for one's spirit-spouse and the place where one attends to the claims of that other. But at the same time the sculptures—many of them carved with great skill—present idealized images of male and female, often in the maturity of life, the hair or beard carefully groomed, the body decorated with scarification patterns and adorned with beads, the face composed, the stance well-balanced. Likewise, among the Igbo people of southeastern Nigeria, the tutelary gods of a town are imaged in wooden figures based upon an idealized human model, for the gods not only have life-giving powers but are also the guardians of morality. The sculptures—for they are often in groups—are looked upon as the “children” of the deity honored. Hence, in their presence the devotee is confronted with conceptions of the self that constrain him or her in thought and action to a deepened awareness of the self that that person is and is not.

Perhaps the most extraordinary images of self and of personal power are carvings that incorporate magical substances (in or on images) to the extent that they alter the human form of the image. They are found for the most part among the Songye and Congo peoples of the lower Congo basin. Some figures have an antelope horn filled with “medicines” projecting from the head, others have nails and small knives pounded into the body, or a magic-holding resin box embedded in the belly. They are visualizations in the extreme of ritual action as manipulative power. Using such carvings in conjunction with words of invocation, the priest or owner of the image engages with the evil in the world, either to project or deflect its aggressive power.

RITUAL ACTIVITY. It is evident that the iconography of African peoples must be understood in the context of ritual activity, where the world as lived and the world as imaged become fused together and transformed into one reality. There are essentially two types of rituals—those in which a person or group undergoes a change in status, usually referred to as rites of passage, and rituals of world maintenance, through which a person or group affirms and seeks to secure in the words and actions of sacrifice a worldview.

Rites of passage. Among many African peoples the masquerade is associated with rites of passage, as, for example, the seasonal rituals of sowing, tilling, and harvesting among the Bwa and Bamana, the funeral rites of the Dogon and the Yoruba, and the rituals of initiation of youth into the societies of the Dan and Mende peoples of West Africa.

Among the Mende people of Sierra Leone, *Nowo*, a female spirit, appears in dance and masquerade to girls being initiated into the Sande (also known as Bundu) ceremonial society. As far as is known, it is the only female mask danced by a woman in Africa. Although primarily associated with the Sande society and thought of as the Sande spirit, *Nowo* also appears in other ritual contexts. Her image is carved on the finals of the rhythm pounders used in the boys' initiation rites, on the staff carried by the leader of the men's Poro society, and on the carved mace of the Mende king, as well as on divination implements, women's ritual spoon handles, and on weaving-loom pulleys. But it is only to the female initiates into Sande that *Nowo* appears in the fullness of the masquerade and the movements of the dance.

In the rituals, *Nowo* is a spiritual presence and images the beauty and power, the nobility, of woman. Thick, dyed-black fiber strands, suspended from a wooden helmet mask, cover the dancer's body. The carved headdress depicts a composed face with faintly opened eyes that see but may not be seen. The head is crowned with an elaborate coiffure into which are woven cowrie shells and seed pods, symbols of wealth and fertility. Black is said to be woman's color, the color of civilized life. The glistening black surface suggests the lustrous, well-oiled skin with which the initiates will re-enter the world. *Nowo* thus provides an image of the physical beauty and the spiritual power of woman to those about to take their place as adults in Mende society.

World maintenance rituals. The role of iconography in Africa's rituals of world maintenance is no less important than in rites of passage. Among the Yoruba, to cite only one example, paired bronze castings of male and female figures joined at the top by a chain, *edan*, are presented to an initiate into the higher ranks of the secret society that worships Onílẹ̀, “the owner of the earth.” The society is known as Ògbóni in Òyó and the region once under the influence of the Òyó Empire in the eighteenth century. In this instance Onílẹ̀ has feminine connotations and exists in a complementary relationship to Olódùmarè, the high god, who is usually thought of in masculine terms. Among the southern Yoruba, the same society is called Òṣùgbó, who also worship Onílẹ̀.

However, the pronunciation of *Onílẹ̀* requires that the term be translated as “owner of the house.” The house is the cult house, which is thought of as a microcosm of the universe. (Yoruba is a tonal language. The word *ilẹ̀* with a high tone on the concluding letter means “house,” and with a low tone and shortened vowel refers to the “earth.”) The secret, visualized in the linking of male and female, appears to refer to a vision of life in terms of its completion and transcendence of time.

The titled members of the Ògbóni/Òṣùgbó society are the elders of the community. They are beyond the time of procreative concerns. For them, sexual differentiation is no longer as important as it once was. Furthermore, kinship distinctions are secondary to the worship of Onílẹ̀, because identification of person by patrilineage is replaced by the allegiance to the unity of all life in Onílẹ̀. Thus, the Ògbóni/Òṣùgbó elders participate in the settling of conflicts that divide the body politic. The sacred emblems of the society, the *edan*, are placed on those spots where the relationships among persons have been broken and blood spilled. Expressing the unity of male and female, they possess the power of reconciling and adjudicating differences and atoning through sacrifice for the violation of the essential wholeness of life, whether imaged in “earth” or “house.”

The seated male and female figures present to the viewer the signs of their power and authority, *àṣẹ*. The female holds a pair of *edan*, as she would twin children. The male figure, with clenched fists, makes the sign of greeting Onílẹ̀. Four chains with tiny bells are suspended from the sides of each figure’s head. The number four, as well as multiples of four, are important in Ifa divination; Òruńmilà (also called Ifá), the divination god, knows the secret of creation and the sacrifices that will make one’s way propitious. Above the spare, ascetic bodies, the heads of the paired figures radiate with their *àṣẹ*. Twelve chains are suspended from the plate below each figure. Twelve is a multiple of three and four, also numbers associated with Ògbóni/Òṣùgbó and Ifá ritual symbolism. In their combination, there is completion and wholeness born of the secret knowledge of Ògbóni/Òṣùgbó and Ifá, a secret readily revealed to the informed eye.

JOHN PEMBERTON III (1987 AND 2005)

ICONOGRAPHY: AUSTRALIAN ABORIGINAL ICONOGRAPHY

Art has a central place in Australian Aboriginal religion. The substance of Aboriginal ceremonies and rituals consists of enactments of events from the Dreaming, or ancestral past, events that are conserved in the form of the songs, dances, designs, and sacred objects that belong to a particular clan or totemic cult group. Such forms are referred to collectively by a word that can be translated as “sacred law,” and it is as “sacred law” that art mediates between the ancestral past and

the world of living human beings. Designs that were created in the Dreaming as part of the process of world creation are handed down from generation to generation as a means of maintaining the continuity of existence with the ancestral past.

Designs can be referred to then as “Dreamings,” and they are manifestations of the ancestral past in a number of senses. Each originated as a motif painted on an ancestral being’s body, as an impression left in the ground by that being, or as a form associated in some other way with ancestral creativity. In many regions myths relate how ancestral beings gave birth to or created out of their bodies the sacred objects associated with particular social groups and land areas. The meaning of the designs on the objects often refers to the acts of ancestral creativity that gave rise to the shape of the landscape; in this respect, the designs can be said to encode Dreaming events. Finally, designs can be a source of ancestral power. Paintings on the bodies of initiates are thought to bring the individuals closer to the spiritual domain; sacred objects rubbed against their bodies can have a similar effect. Upon a person’s death in eastern Arnhem Land, designs painted on his or her chest or on the coffin or bone disposal receptacle help to transfer the soul back to the ancestral world for reincorporation within the reservoirs of spiritual power associated with a particular place. Art is linked with the concept of the cycling of spiritual power through the generations from the ancestral past to the present, a concept that characterizes Aboriginal religious thought. The same design may later be painted on an initiate’s chest, signifying what Nancy Munn refers to in *Walbiri Iconography* (1973) as the intergenerational transfer of ancestral power, which conceptually integrates the Dreaming with present-day experience.

Aboriginal art varies widely across the continent. Any similarities that exist tend to reside in the properties of the representational systems that are employed—the kinds of meanings that are encoded in the designs and the way in which they are encoded—rather than in the use of particular motifs. One notable exception appears to be what Munn refers to as the circle-line or site-path motif ($0 = 0 = 0$), which forms a component of designs throughout Australia. In such designs, the circles usually refer to places where some significant event occurred on the journey of a Dreaming ancestral being, and the lines refer to the pathways that connect the places.

Likewise, designs in Aboriginal art exist independent of particular media. The same design in Arnhem Land may occur as a body painting, a sand sculpture, an emblem on a hollow log coffin, or an engraving on a sacred object (*rangga*). In central Australia the same design may be incised on a stone disc (*tjurunga*), painted on the body of a dancer in blood and down, or made into a sand sculpture. Further, it is the design that gives the object its particular ancestral connection: the designs are extensions of ancestral beings and are sometimes referred to as their “shadows.” Thus, they can be

used in different contexts for different purposes. The same basic design may be used as a sand sculpture in a curing ceremony, painted on the bodies of initiates to associate them with particular ancestral forces or signify membership in a social group, or painted on a coffin to guide a dead person’s soul back to the clan lands for reincorporation within the ancestral domain.

SYSTEMS OF REPRESENTATION. Meaning in Aboriginal art is encoded in two distinct systems of representation, one iconic and figurative, the other aniconic and geometric. The iconography of Aboriginal religious art arises out of the interplay between these two complementary systems. This distinction extends outside the area of the visual arts to dance and ceremonial action, which involve some components and actions that are essentially mimetic and represent the behavior and characteristics of natural species, as well as other components that are abstract and have a conventional and non-representational meaning. The balance between the figurative and the geometric varies from one region to another. The art of central Australia, of groups such as the Warlpiri, the Aranda, the Pintubi, and the Pitjantjatjara, is characterized by geometric motifs, whereas western Arnhem Land is associated with a highly developed figurative tradition. Nonetheless, there is a figurative component in central Australian art, and the *marayin* designs, clan-owned body painting designs used in certain western Arnhem Land initiation ceremonies, are largely geometric.

The forms of Aboriginal art are systematically linked to its various functions. The figurative art presents images of the Dreaming that at one level can be readily interpreted as representations of totemic species and the forms of ancestral beings. The X-ray art of western Arnhem Land, for example, is a figurative tradition that creates images of totemic ancestors associated with particular places, thus linking them directly to the natural world.

The title of Luke Taylor’s book, *Seeing the Inside*, aptly expresses the capacity of X-ray art to look beyond the surface form of things. The figures are in part accurate representations of kangaroos, fish, snakes, and so on. However, they are more than that. The X-ray component, representing the heart, lungs, and other internal organs of the animal, adds an element of mystery to the figures and differentiates the representations from those of ordinary animals. Moreover, the art includes representations that combine features of a number of different animals in a single figure. For example, the figure of the Rainbow Snake, an important mythical being throughout Arnhem Land, may combine features of a snake, a kangaroo, a buffalo, an emu, and a crocodile. Such figures in X-ray art, together with songs and dances associated with them, are part of a system of symbolism that decomposes the natural world into its elements, breaks the boundaries between different species of animals, and alludes to the underlying transforming power of the Dreaming. The western Arnhem Land X-ray figures are public representations of the ancestral world and, painted on cave walls, are projec-

tions of the ancestral past into the present in a fairly literal form. Their presence on rock surfaces acts as a sign of the ancestral transformations that created the form of the landscape and a reminder of the creative forces inherent in the land.

Much of the ceremonial art and most of the secret art of Australia is, however, geometric in form. The geometric art encodes meaning in a more elusive way, well suited to a system of esoteric knowledge in which some of the meanings of art are restricted to the initiated. Without some assistance, its meaning will remain a mystery: in order to be understood it has to be interpreted and its meanings have to be revealed. Geometric art gives priority to no single interpretation, and as a person grows older he or she learns increasingly more about the meaning of particular designs. Thus, geometric art is potentially multivalent, and different meanings and interpretations can be condensed into the same symbol or design.

This property of geometric art enables it to encode the relationship between different phenomena or orders of reality. On one level, a circle in a design may represent a water hole, and the line joining it may represent a creek flowing into the water hole. On another level, the circle may be said to represent a hole dug in the ground and the line a digging stick. On yet another level, the circle may be interpreted as the vagina of a female ancestral being and the line as the penis of a male ancestor. All three interpretations are related, for digging in the sand is an analogue for sexual intercourse, and the water hole was created through sexual intercourse between two ancestral beings in the Dreaming. The design of which the circle is a part may belong to a particular clan and be identified as such. The design as a whole thus represents ancestral beings creating features of the landscape in territory associated with a particular social group. It is this set of associations that characterizes the iconography of Aboriginal art: the designs mediate between the present and the ancestral past by encoding the relationship between ancestral being, people, and place. Aboriginal religion firmly locates the identity of people in the spirituality of place, and designs infused with the power of ancestral beings provide an important transportable medium of connection.

The geometric art represents the ancestral world both semiotically and aesthetically, by expressing ancestral power in an artistic form. The Dreaming beings are often complex concepts, and their encoding in abstract representations provides one of the ways by which people develop shared understandings that help to order their collective experience of the ancestral past. For example, in the case of the Yolngu people of northeastern Arnhem Land, the Wild Honey ancestor consists of the whole set of things associated with the collection of wild honey: the hive, the bees, the honey; pollen and grubs; the paperbark tree where the hives are found and the swamps where the trees grow; the hunter, his baskets, and the smoke made by the fires he lights. All things associated with wild honey are attributes of the Wild Honey ancestor. In painting, the Wild Honey ancestor is represented by a

complex diamond pattern representing the cells of the hive. The diamonds are cross-hatched in different colors to signify different components of the hive: grubs, honey, pollen, and bees. The bars across some of the segments represent sticks in the structure of the hive, and the dots within the circles represent bees at its entrance. On another level, elements of the design signify smoke, flames, and ash from the hunter's fire, and on still another level, the diamond pattern represents the rippling of floodwater as it passes beneath the paperbark trees. The Wild Honey ancestor is all of those things and more.

SYSTEMS OF INTERPRETATION. As people go through life they learn the meanings of designs such as the Wild Honey pattern; they associate it with places created by the ancestral being and with ceremonies that celebrate that being's creative power. For the individual, the design is no longer an abstract sign but a manifestation of the ancestral being concerned. Aesthetic aspects of the design reinforce this understanding, as Howard Morphy has shown in *Ancestral Connections*, his book on the aesthetics and iconography of Yolngu ritual art. In northeastern Arnhem Land, Yolngu body paintings convey a sense of light and movement through the layering of finely cross-hatched lines across the skin surface. Similar effects are created in central Australian painting through the use of white down and the glistening effect of blood, fat, and red ochre. These attributes of paintings are interpreted by Aboriginal people as attributes of the ancestral being: the light from the ancestral being shines from the painting as symbol or evidence of the power of the design.

Throughout much of Australia, rights to designs and other components of "sacred law" are vested in social groups that exercise some control over their use and have the responsibility to ensure that they continue to be passed down through the generations. Such rights are of considerable importance, as "sacred law" provides the charter for ownership and control of land. Hence, designs not only represent sources of ancestral power but are politically significant in demonstrating rights over land and providing a focal point for group solidarity and identity. This dimension is reflected in the iconography insofar as designs often vary on the basis of group ownership, each group holding rights to a unique set of designs.

There is enormous regional variation in Australian Aboriginal art, and the specific symbolism of the designs can only be understood in their regional context. However, the underlying principles of the art have much in common everywhere. Moreover, belief in the spiritual power and mediating functions of the designs is to an extent independent of knowledge of their meaning. For both these reasons, designs and other components of ritual can be passed on to other groups—from neighboring or even quite distant places—and become part of those groups' ancestral inheritance. In this respect, religious iconography is integral to the process of religious change, enabling religious ideas to be exchanged with other groups and diffused across the continent. Changes also

can occur internally through the Dreaming of new designs. This allows the iconographic system to adjust to sociopolitical reality or to the creation of new groups and the demise of existing ones. However, from the Aboriginal viewpoint, such changes are always revelatory: they ultimately have a Dreaming reference and will always be credited to the past. The designs not only encode meanings that help endow everyday events and features of the landscape with cosmic significance, but are themselves extensions of those Dreaming ancestors into the present.

Since the 1970s, through the popularity of Aboriginal bark and acrylic paintings, art has become an increasingly important means by which Aboriginal people communicate religious ideas to a wider audience. While non-Aboriginal audiences have been attracted by the aesthetic dimension of the works, they also have been exposed to the religious ideas and values that are integral to them. Exhibitions of Aboriginal art emphasize the religious values that the works embody: the idea of the Dreaming, the immanence of the sacred in the form of the landscape, and the emergent nature of spirituality.

Aboriginal people also have responded to and accommodated religious ideas through their art. Yolngu artists from Arnhem Land carried on a dialogue with Christianity from the arrival of the first missionaries in 1935. This dialogue resulted in the placing of painted panels of Yolngu religious art on either side of the altar of the new church built in 1962. Subsequently, as Fred Myers has shown, the Pintubi artist Linda Syddick's paintings combine Christian themes concerning crucifixion with reflections on separation and identity stimulated by the science fiction character E.T., all represented through central Australian iconography. This dynamic aspect of Australian Aboriginal art and its capacity to reach diverse audiences within and outside the society is one of the factors that has enabled Aboriginal religion to continue to make a contribution to global religious discourse.

ICONOGRAPHY: NATIVE NORTH AMERICAN ICONOGRAPHY

Iconography is a living force in North American Indian religious life, past and present. Rooted in mythical imagery, it informs the content of individual dreams and nourishes the themes of contemporary Indian art. A study of the iconography of a people provides a unique opportunity to gain insight into what Werner Müller calls the "pictorial world of the soul" (*Die Religionen der Waldlandindianer Nordamerikas*, Berlin, 1956, p. 57).

The following exposition of the major themes of religious iconography in North America is restricted to the evidence of the late-nineteenth and twentieth centuries of ethnographic research. As a result, the beautiful pottery and stone remains of the prehistoric peoples of the Southwest and Southeast are not represented here, nor are the remains of the Mound Builder cultures of the river regions.

The iconographical themes follow the general lines of myth and religious beliefs. As such, they can be cataloged in

the following manner: the cosmos, supreme beings, tricksters/culture heroes, guardian beings, other mythic beings, astronomical beings, weather beings, animal beings, vegetation beings, human beings, geological beings, and abstract symbols. But it is not always the case that the verbal images of the myths are equivalent to iconographical images: one notorious example of divergence is the Ojibwa trickster, Rabbit, who, when pictured, is actually human in form.

Concerning the wide variety of media used, the following general distribution can be observed: in the Far North—ivory, bone, and stone; the Northeast and Southeast Woodlands—wood, bark, skin, quillwork, and beadwork; the Plains—skin, beadwork, pipestone, quillwork, and painting of bodies and horses; the Northwest Coast—cedar, ivory, argillite, blankets, and copper; California—baskets and some stone; the Southwest—sand painting, wood, stone, baskets, pottery, jewelry, and dolls.

THE COSMOS. Cosmologies vary from tribe to tribe in both content and imagery. But whereas the mythical image of the universe (its cosmography) may be highly detailed, the iconographical rendering is necessarily restricted. The cosmos is most often graphically limited to those elements that characterize its basic nature and structure, including its nonvisual aspects.

The most widespread symbol of the whole cosmos is the ceremonial lodge, house, or tent. The fundamental idea of the ceremonial lodge, such as the Delaware *xingwikáon* (“big house”), is that all of its parts symbolize, and in ritual contexts actually are, the cosmos. Usually the realms of this cosmos are interconnected with a central post, which is conceived of as extending itself like a world tree up to the heavens. Renewing such a house constitutes the actual renewal of the cosmos.

Similar ideas are found among the Plains Indians, for whom the sacred camp circle constitutes an image of the world, and the central pole of the Sun Dance tipi, the whole cosmos. In fact the Crow call this tent the “imitation” or “miniature” lodge, a replica of the Sun’s lodge.

Representations of the cosmos can refer to the more subtle manifestations of the world, as in the sand paintings of the Luiseño of California, but they can also approach the reality of topographical maps, as in the sand paintings of the neighboring Diegueño. In a completely different approach to the visualization of the cosmos, the well-known Navajo sand painting of Father Sky and Mother Earth illustrates the anthropomorphic representation of the cosmos.

Concerning nonvisual aspects of the cosmos, it is not uncommon that ethical ideals or holistic images of proper human life, which are extensions of the theological bases of many cosmologies, are also visualized iconographically. The most common image of this type is that of the right, or the beautiful, path. The Delaware big house has a circular path on its floor, which the visionary singers and other participants in the big house ceremony walk and dance upon. This

path is called the Good White Path, the symbol of the human life. It corresponds to the Milky Way, which is the path of the souls of the dead. The Ojibwa bark charts of the Midewiwin ceremony consist of illustrations of the degrees of initiation into the Mide secret society. All of the degrees are represented as connected by the path of the initiate’s life, starting in the image of the primordial world and ending upon the island of direct communication with the supreme being. This path is pictured with many detours and dramatic occurrences.

SUPREME BEINGS. Among the myriad images found in North American Indian iconography are certain divine beings whose representations cut across taxonomic groups; these include supreme beings, tricksters/culture heroes, guardian beings, and other mythical beings. Since the majestic, all-encompassing supreme being is difficult to visualize, its morphology is relatively simple. When not visualized as some object or animal intimately associated with the supreme being, its form tends to be anthropomorphic. For example, the Ojibwa song charts visualize the supreme being, Kitsi Manitu, with a pictograph of a human head, belonging to an initiate in the Mide secret society.

On the other hand, the all-pervasiveness of the supreme being among the Plains Indians can result in the use of symbols of lesser deities to represent it. Thus Wakantanka, of the Oglala Lakota, has various manifestations such as the Sun, the Moon, Buffalo, and so on, all of which are pictured on hides or, as with Buffalo, represented by a buffalo skull.

TRICKSTERS/CULTURE HEROES. The most widespread iconographic trickster type is theriomorphic: Raven, Coyote, or Rabbit. The most well-known image is that of Raven among the Northwest Coast tribes, a character who encompasses all of the classical features of the trickster. He is pictured in raven-form on virtually every object throughout the Northwest, usually in the context of a mythical event that somehow affected the ancestor of the house in which the object is found, be it house pole, settee, or some other form. As part of shamanic paraphernalia, his image imparts one of his main characteristics: that of transformation. Even though the trickster is an animal, in mythical thought he can change to human form, and this process is often reflected iconographically, as with the Navajo Coyote and the Delaware and Ojibwa Rabbit.

The culture hero is a divine or semidivine mythic figure who, through a series of heroic deeds—especially the theft of such an important item as fire or light—starts humanity upon its cultural road. When he is not the theriomorphic trickster, he is often simply visualized as a human being.

GUARDIAN BEINGS. Guardian beings associate themselves most often on a personal level with single individuals, and they function as guardians who bring blessings to their human partners. In the Plains and Northern Woodlands cultures, to seek and receive a personal vision of just such a guardian is necessary in order to secure an individual’s station in life. These guardians can appear in just about any

form taken from the natural or the mythological world. Among the Oglala it may be necessary to paint a version of one's vision on the tipi in order to secure its validity, although generally images of the guardian are painted on shields.

In the cultures of the Far North and Arctic areas, the shaman and his guardians are a constant iconographic theme. His guardians are portrayed in several general ways: as diminutive human beings clustered near the shaman or as human faces clustered together, as a human visage under an animal visage such as seen in Alaskan masks, as an animal form reduced in size and resting on the head or shoulders of the shaman, as birdlike shamans or shamans in transformation, as flying spirits being ridden by shamans, as an animal or human being with skeletal markings, or as flying bears or other usually flightless beasts. These images are portrayed in contemporary drawings, ivory sculpture, masks, stone sculpture, bone sculpture, drumsticks, shaman staff, and so on. Throughout North America the shaman also uses organic parts of his guardians in his ritual paraphernalia, or else he can use the entire skin of his guardian animal to transform himself.

Guardians appear in nonvisionary and nonshamanistic cultures as well. The Pueblo deities of the six world regions are considered to be guardians of humanity. Another type of guardian is Rainbow Serpent, pictured on almost all Navajo sand paintings. This figure encircles the entire painting but remains open toward the east. Its function is to keep the evil spirits out of the reinstated cosmic region.

OTHER MYTHICAL BEINGS. Among the mythological figures who are pictured iconographically, one important group is that of monsters. The most common monster motif is an image of the primordial horned, flying serpent, the cause of floods and earthquakes. He is known all over the Americas and is generally pictured in exactly the form described. Another monster known all over North America is Thunderbird, usually pictured on shields, shirts, and beadwork as an eaglelike creature.

There is also a whole group of evil beings who, in one form or another, are believed to exercise a malignant and dangerous influence on humanity. Such creatures are usually theriomorphic but not necessarily so.

ASTRONOMICAL BEINGS. The sun, the moon, and the stars are pictured as beings throughout North America. The sun is portrayed most intensely where it is strongest, in southeastern and southwestern North America. The Hopi portray the Sun, Taawa, anthropomorphically but, in keeping with Hopi iconography, he wears a mask that consists of a circular disk fringed with radiating feathers and horsehair. This radial representation of the sun is the most common image known. The Ojibwa, on the other hand, have a completely different image, which is horned, winged, and legged.

The moon is usually represented in its quarter phase, although images of the full moon are sometimes found. The

stars most often pictured are the Morning Star (Venus), the Pleiades, Orion, Altair, the constellation Ursa Major (which is invariably pictured as a heavenly bear), and the Milky Way. Stars are shown with four, five, and six points and are often associated with human figures.

METEOROLOGICAL BEINGS. This group consists of Thunder, Wind, Rain, and Lightning. Thunder is often pictured as the Thunderbird, but other birds can also be used. Wind, on the other hand, is generally associated with the cardinal regions and therefore not visualized directly. Cultures with anthropocentric morphology, however, such as the Navajo and the Ojibwa, picture even this being in human shape.

Rain is usually illustrated as lines falling from cloud symbols or as a being from which rain is falling. Lightning is always shown as zigzag lines regardless of the tribe in question. The lines usually end in arrowheads, for there is a conceptual link between lightning and arrows. Lightning and thunder are usually considered to be the weapons of the widely known Warrior Twins.

ANIMAL BEINGS. There are a number of animals which are known and visualized throughout North America, such as the bear, the deer, and the buffalo. However, other animals peculiar to a particular region are the more common iconographical subjects, such as the whales and seals of the northern coasts, or the lizards and snakes of the desert regions. The general rule is that the animal is depicted in its natural form.

Representations of animals may signify the spirit or master of their species or the form of some deity, guardian being, or primordial creature, or they may indicate the totem animal. All animal images used in ritual contexts have religious significance. But the most common use of animal images occurs in heraldry, which casts some doubt on the exclusively religious significance of its use and meaning.

The Northwest Coast Indians are the most conspicuous users of totem symbols. These symbols are represented in literally every conceivable medium: poles, house fronts, hats, aprons, spoons, bowls, settees, boat prows, spearheads, fish-hooks, dagger handles, facial painting, masks, speaker staffs, paddles, drums, rattles, floats, bracelets, leggings, pipes, and gambling sticks. The question of religious significance may be resolved by the fact that the totem animal is considered either a direct ancestor of the clan or somehow associated with an ancient human ancestor. Thus the symbol at least, if not its use, has religious meaning.

VEGETATION BEINGS. Corn is the plant most commonly visualized. The representation can simply refer to the plant itself, but frequently a maize deity is being invoked. The latter is the case throughout the Southwest, whether among the Pueblo or the Athapascan peoples. The maize deity is usually clearly anthropomorphized. Hallucinogenic plants such as peyote, jimsonweed, or the strong wild tobaccos are more or less realistically pictured; such images refer to the deities of these potent plants. Others beings who somehow influence plant growth are also visualized iconographically; these in-

clude the Yuki impersonations of the dead, who have a decided influence on the abundance of acorns, or the Hopi impersonations of cultic heroes and heroines whose rituals influence crop growth.

HUMAN BEINGS. This category concerns not only human ancestors but also a miscellaneous collection of beings that have human form. The first type are effigies of once-living human beings. These are most commonly figured on Northwest Coast mortuary poles, but they are also found elsewhere: the Californian Maidu, Yokuts, Luiseño, and Tubatulabal, for example, all burn effigies of prominent people two years after their deaths.

Human images can also be material expressions of the ineffable. During the Sun Dance the Shoshoni and the Crow each bring out a stone image in diminutive human shape, which is then attached to a staff or the center pole of the tent. It is said to represent the spirit of the Sun Dance. Human images, such as dolls, can symbolize or are actually considered to be small spritelike creatures who can have an array of functions and duties and who play a part in ceremonial contexts as well. Human representations can also signify the heroes or founders of cults; such is the case with many images on Pueblo altars and other representations on Northwest Coast poles.

GEOLOGICAL BEINGS. This category of images is based on a type of religious geomorphology. It is not a numerically dominant theme, but it is nonetheless of singular importance. The most prominent geological being envisioned is Mother Earth, although it is seldom that direct representations of it occur. In such anthropocentric iconographies as that of the Navajo, it is no problem to illustrate Mother Earth as a somewhat enlarged female human being. Usually, however, Mother Earth is symbolized by some fertility image, such as an ear of corn, or by a circle. Among the Delaware, the earth is symbolized by the giant tortoise who saved humankind from the flood and upon whose back the new earth was created by Nanabush. Sods of earth can also be used to represent Mother Earth, as in the Cheyenne buffalo-skull altar in the medicine lodge.

Another group of geological beings consists of images of mountains. Except for isolated pockets of flatlands and desert basins, most of North America is covered with mountains, and these are usually believed to be alive or at least filled with life, that is, they are the abodes of the gods. This feature of mountains is highly important and is also recognized iconographically.

Finally, some mention should be made of stones and prehistoric implements. Animacy or power is attributed to implements such as ancient pipe bowls, mortars, and blades, any odd-shaped stones, and stones resembling animal, vegetable, or human outlines. Such stones symbolize whatever they resemble.

ABSTRACT SYMBOLS. The dynamic and highly stylized geometric patterns on Southwest Indian pottery, which repre-

sent categories already discussed (such as clouds, rain, lightning, the sun, and so on), also belong to the category of abstract symbols. Cultures with highly developed artistic iconographies, such as those of the Northwest Coast, the Southwest, and the Woodlands peoples with their birchbark illustrations, also develop series of signs referring to abstractions inherent to their systems. On the Ojibwa Midewiwin scrolls, for example, the symbol of bear tracks in a particular context represents a priest's four false attempts to enter the Middle lodge. These four false attempts can also be symbolized by four bars.

BIBLIOGRAPHY

There is unfortunately no comprehensive work on the religious iconography of the North American Indians. Information about iconography is found in the original ethnographic data on various peoples published in the annual reports and the bulletins of the Bureau of American Ethnology. An ethnographic approach to art in North America, with emphasis on prehistoric art, can be found in Wolfgang Haberland's *The Art of North America*, translated by Wayne Dynes (New York, 1964). General works on the art of American Indians are numerous; the most comprehensive is Norman Feder's *American Indian Art* (New York, 1971). Another useful study is Frederick J. Dockstader's *Indian Art of the Americas* (New York, 1973).

For the Indians of the Far North, see Jean Blodgett's *The Coming and Going of the Shaman: Eskimo Shamanism and Art* (Winnipeg, 1979) and Inge Kleivan and Birgitte Sonne's *Eskimos: Greenland and Canada*, "Iconography of Religions," sec. 8, fasc. 1 (Leiden, 1984). Concerning the Northeast and Southeast Woodlands tribes, see Frank G. Speck's *Montagnais Art in Birch-bark, a Circumpolar Trait*, "Museum of the American Indian, Heye Foundation, Indian Notes and Monographs," vol. 11, no. 2 (New York, 1937), and *Concerning Iconology and the Masking Complex in Eastern North America*, "University Museum Bulletin," vol. 15, no. 1 (Philadelphia, 1950). For the Plains Indians, see Åke Hultkrantz's *Prairie and Plains Indians*, "Iconography of Religions," sec. 10, fasc. 2 (Leiden, 1973), and Peter J. Powell's *Sweet Medicine: The Continuing Role of the Sacred Arrows, the Sun Dance, and the Sacred Buffalo Hat in Northern Cheyenne History*, 2 vols. (Norman, Okla., 1969). For Indians of the Northwest Coast, see Charles Marius Barbeau's *Totem Poles*, 2 vols. (Ottawa, 1950–1951), and Franz Boas's *Primitive Art* (1927; new ed., New York, 1955). Concerning the Pueblo Indians of the Southwest, see my *Hopi Indian Altar Iconography*, "Iconography of Religions," sec. 10, fasc. 4a (Leiden, 1986), and Barton Wright's *Pueblo Cultures*, "Iconography of Religions," sec. 10, fasc. 4 (Leiden, 1985). For the Navajo Indians of the Southwest, see Sam D. Gill's *Songs of Life: An Introduction to Navajo Religious Culture*, "Iconography of Religions," sec. 10, fasc. 3 (Leiden, 1979), and Gladys A. Reichard's *Navajo Medicine Man: Sandpaintings and Legends of Miguelito* (New York, 1939).

ARMIN W. GEERTZ (1987)

ICONOGRAPHY: MESOAMERICAN ICONOGRAPHY

Each major Mesoamerican culture developed its religious imagery in a distinctive fashion, although all were historically interlinked and drew from the common pool of Mesoamerican stylistic-iconographic tradition. This type of pictorialization was especially important in an area cotradition that lacked fully evolved phonetic scripts. It constituted an effective technique of visually communicating in a standardized, codified manner the basic concepts of the religious-ritual systems that played such a crucial sociocultural role in pre-Hispanic Mesoamerica.

ISSUES OF INTERPRETATION. The Mesoamerican iconographic systems that were functioning at the time of the Spanish conquest in the early sixteenth century can be interpreted with the aid of a broad range of data, including written sources compiled in Spanish and in the native languages. The iconographies of the earlier cultures must be studied without the assistance of texts of this type and pose much greater interpretative difficulties. The technique most often employed has been to invoke similarities between the Conquest period images, whose connotations are reasonably well understood from ethnohistorical information, and those of the earlier traditions, assigning to the latter generally similar meanings. This procedure, employing the elementary logic of working from the known to the unknown, is often referred to as the “direct historical approach” or “upstreaming.”

This technique has been criticized, particularly when long temporal spans are involved. Disjunctions between form and meaning in religious imagery, it has been pointed out, have been common in iconographic history (above all in the Western tradition with the sharp ideological breaks that accompanied the rise of Christianity and Islam). However, those who sustain the validity of the direct historical approach argue that no major disjunctions of the type that occurred in the West took place in pre-Hispanic Mesoamerica. They cite various examples of imagic continuity from Olmec to Aztec and suggest that Mesoamerica can be more fitly compared to pre-Christian Egypt or to India and China, areas well known for their long-term iconographic continuities of form and meaning. These disagreements among leading scholars indicate that considerable caution is advisable when appraising the accuracy of interpretations of religious images and symbols of the more ancient Mesoamerican cultures.

OLMEC. Most archaeologists agree that the earliest sophisticated religious iconographic system in Mesoamerica was that of the Olmec, which flourished between about 1200 and 400 BCE (Middle Preclassic), and was centered in the Gulf Coast region of eastern Veracruz and western Tabasco. Olmec style, which conveyed religious concepts imaginatively and effectively, was one of the most striking and original esthetic expressions ever achieved in pre-Hispanic Mesoamerica. Unfortunately, accurately ascertaining the connotations of the

intricate Olmec symbol system presents formidable difficulties, and interpretations of prominent students often differ radically.

A major characteristic of Olmec iconography is the blending of anthropomorphic and zoomorphic features. Much of the controversy surrounding the interpretation of Olmec iconography has focused on these fused images, which often exhibit additional overtones of infantilism and dwarfism. The most popular interpretation has been that they merge feline with human characteristics, and the term *were-jaguar* has become fashionable to refer to them. Frequently cited in support of this interpretation are two well-known Olmec monumental sculptures from two small sites near the great Olmec center of San Lorenzo, Veracruz, that supposedly represent a jaguar copulating with a human female, thus producing a hybrid feline-human race, the “jaguar’s children.” In this view, the composite creature, connoting rain and terrestrial fertility, constituted the fundamental Olmec deity, the archetypical ancestor of all later Mesoamerican rain-and-fertility gods. However, another interpretation would give preeminence to crocodilian rather than feline imagery; the rattlesnake and the toad also have their vigorous proponents.

Other Olmec composite beings are recognized, but opinions differ concerning the precise zoological identification of their constituent elements. A considerable case has been presented for the importance of a polymorphic, essentially saurian creature with various aspects. Called the Olmec Dragon, it has been postulated as the ancestor of a variegated family of celestial and terrestrial monsters prominent in later Mesoamerican iconography.

To what extent Olmec religious imagery indicates the existence of discrete, individualized deities has also elicited considerable debate. Some scholars argue for a fairly sizable Olmec pantheon, often linking its members with prominent contact-period gods. Others view Olmec symbolism as connoting various generalized supernaturalistic concepts but not recognizable deities—which, in their opinion, did not emerge in Mesoamerica until much later. However, it seems likely that at least prototypical versions of various later deities were already being propitiated in “America’s first civilization.”

IZAPA. A series of closely interrelated stylistic and iconographic traditions known as “Izapan,” after the major site of Izapa, Chiapas, Mexico, flourished between about 500 BCE and 250 CE (Late Preclassic-Protoclassic) in the area flanking the Isthmus of Tehuantepec, concentrated in the Pacific slope region of Chiapas, Guatemala, and El Salvador. Izapan iconography bears a close relationship to Olmec, from which it partly derives, but its formats are generally somewhat more complex. The style is most typically expressed by low-relief carving, commonly on the perpendicular stone monuments known as *stelae*, which are sometimes fronted by plain or efigy “altars.”

Izapan iconography frequently displays a narrative quality in its compositions, depicting a variety of ritual-mythic scenes, some of considerable complexity. These scenes are often framed by highly stylized celestial and terrestrial registers, interpreted as monster masks. As in Olmec, polymorphic creatures, ostensibly merging feline, saurian, and avian elements, are common. Even more than in the case of Olmec, identifying recognizable deities is difficult, but prominently featured in Izapan iconography is the profile mask of the “long-lipped dragon,” depicted in numerous variants including the “scroll-eyed demon.” Another significant Izapan composite creature was the “bi- and tricephalous monster,” apparently with both celestial and terrestrial connotations. Also prominent on Izapan monuments are downward-flying, winged, anthropomorphic beings, downward-peering celestial faces, combat scenes (humanoid figures versus double-headed serpentine creatures), polymorphic bird monsters, cosmic trees with “dragon-head roots,” and diminutive human ritual celebrants accompanied by various ritual paraphernalia. This region during the Late Preclassic and Protoclassic periods produced some of the most iconographically intriguing sculptures of Mesoamerica.

CLASSIC LOWLAND MAYA. The Izapan tradition led directly into the most sophisticated of all Mesoamerican iconographic and stylistic traditions, that of the Classic Lowland Maya (c. 25–900 CE). As in the case of Izapan, which lies in its background, Maya art in general is essentially two-dimensional and painterly but is also more structured and mature in its expressive power than the earlier tradition. Nearly all of the most common Izapan iconographic themes were retained and often further elaborated. These included the bi- and tricephalous polymorphic celestial-terrestrial creature now frequently conceived as the “ceremonial bar” held by the rulers, the long-lipped dragon in numerous manifestations that eventually evolved into the long-nosed god of rain (Chac), celestial and terrestrial enclosing frames, cosmic trees, and avian composite creatures (serpent birds). Some deities that were clearly prototypical to those represented in the iconography of Postclassic Yucatán can be discerned in Maya religious art of the Classic period. Classic Maya stelae—accurately dated, erected at fixed intervals, and containing long hieroglyphic texts—display profile and frontal portraits of the great Maya dynasts. Their elaborate costumes are replete with religious symbols that invested them with the aura of divinity.

A particularly complex Lowland Maya iconography is portrayed on Late Classic painted ceramic vessels usually encountered in burials. An extensive pantheon of underworld supernaturals is featured in these scenes. It has been suggested that they frequently display connections with the Hero Twins of the *Popol Vuh*, the cosmogonical epic of the Quiché Maya of Highland Guatemala. The representations on these vessels were probably derived at least in part from painted screenfold paper books. Although no Classic period examples have been found, the surviving Postclassic specimens (known as Codex Dresden, Codex Paris, and Codex Madrid) provide

some notion of the magnitude and importance of this lost Classic Maya “iconographic archive.” The recent progress that has been made in the decipherment of Lowland Maya hieroglyphic writing has resulted in a considerably improved understanding of the meaning of the religious imagery so richly developed in this most spectacular of ancient New World cultures.

MONTE ALBÁN. Another major Mesoamerican cultural tradition, connected in its origins with Olmec and having some Izapan ties, was that of Monte Albán, so named from the huge site near the modern city of Oaxaca. Already well developed in Late Preclassic times (Monte Albán I-II, c. 600 BCE–100 CE), its full flowering occurred during the Classic period (Monte Albán IIIa–b, c. 100–700 CE). Monte Albán iconography is one of the richest and most structured in pre-Hispanic Mesoamerica. There is general agreement that a numerous pantheon of individualized deities was portrayed, especially in the famous funerary urns, theomorphic ceramic vessels placed in tombs. Many deities are identified by their “calendric names,” the day in the 260-day divinatory cycle on which they were believed to have been born. Some can be tentatively connected with deities known to have been propitiated by the Zapotec-speakers who occupied most of the area around Monte Albán at the time of the Conquest, including the basic rain-and-fertility god, Cocijó. The walls of a few tombs at Monte Albán display painted images of deities or deity impersonators, some of them identical to those depicted on the ceramic urns. The hieroglyphic writing of Monte Albán is still poorly understood, but it has been of some aid in interpreting the iconography of one of the greatest of the Mesoamerican Classic civilizations.

TEOTIHUACAN. Dominating the Classic period (c. 100–750 CE) in central Mexico—and spreading its influence throughout Mesoamerica—was the dynamic civilization of Teotihuacan, centered in the urban metropolis known by that name at the time of the Conquest and located about twenty-five miles northeast of Mexico City. Teotihuacan iconography, evidenced by a plethora of ceramic and stone pieces and numerous mural paintings, was one of the most intricate and variegated of ancient Mesoamerica. Symmetry and repetitiveness were hallmarks of Teotihuacan formats, which, particularly in the murals, include processions of ritual celebrants, frontal anthropomorphic and zoomorphic images flanked by profile figures, and complex scenes involving numerous personages engaged in a variety of activities. The dominant theme was clearly the promotion of fertility, featuring what appear to have been at least two major aspects of the preeminent rain-and-fertility deity that was prototypical to the Aztec Tlaloc. Aquatic and vegetational motifs are ubiquitous.

To what extent clear-cut deity representations are present in Teotihuacan iconography, as in the case of the earlier Mesoamerican traditions already discussed, has generated considerable differences of opinion. Various motif clusters have been defined, which some have suggested might have

connoted distinct cults. Certain images have also been identified as discrete deities of the Aztec type, and they have often been labeled with Nahuatl names. They include Tlaloc, the rain-and-earth god; a female fertility deity who may be the prototype of various Aztec goddesses (Chalchiuhtlicue, Xochiquetzal, Teteoinnan, and others); an old fire god (Aztec Huehueteotl or Xiuhtecuhtli); the flayed god (Xipe Totec); a butterfly deity, the Fat God (possibly prototypical to Xochipilli/Macuilhochtli, the Aztec god of sensuality); and, perhaps, prototypes of Quetzalcoatl, the feathered serpent creator-and-fertility god; Xolotl, god of monsters and twins; and Tecciztecatl, the male lunar deity. As in earlier and contemporary Mesoamerican traditions, composite zoomorphic images are another hallmark of Teotihuacán iconography. Some, such as the feathered serpent, may have served as the “disguises” or avatars of various deities, as in the Aztec system.

CLASSIC VERACRUZ. During the Early Classic period (c. 100–600 CE), after the fade-out of the Olmec tradition in the Gulf Coast region, a distinct regional stylistic and iconographic tradition emerged, climaxing during the Late Classic and Epiclassic periods (c. 600–900 CE). It was best expressed at the major site of El Tajín, in northwest Veracruz, where a sophisticated style of relief carving, featuring double-outlined, interlocking scroll motifs, decorates a number of structures; these include the famous Pyramid of the Niches, two ball courts with friezes portraying complex sacrificial rituals connected with the ball game, and even more complicated ceremonial scenes on a series of column drums in the Building of the Columns.

The most famous exemplars of Classic Veracruz iconography are the handsomely carved stone objects worn by the ball players or replicas thereof: yokes (ballgame belts); *hachas*, thin stone heads; and *palmas*, paddle-shaped stones, the latter two objects attached to the yokes worn by the players. Sculptured on these pieces are various anthropomorphic and zoomorphic beings, especially a monstrous creature probably symbolizing the earth. A major tradition of ceramic sculpture also flourished in this region during the Classic period. Some examples appear to represent deities that were prototypical to those of Postclassic times. They include the Old Fire God; versions of Tlaloc and long-lipped beings probably related to the iconographically similar Izapan and Maya rain-and-fertility deities; male and female figures wearing human skins, evidencing rituals similar to those of the Aztec fertility deities Xipe Totec and Tlazolteotl/Teteoinnan; the Fat God; perhaps a proto-Ehécatl (wind god); and a whole complex of smiling figures seemingly expressing aspects of a cult of sensuality—possibly involving the ritual ingestion of hallucinogens—similar to that of Xochipilli/Macuilhochtli of later times. Complex ceremonial scenes are also represented on mold-pressed, relief-decorated ceramic bowls.

XOCHICALCO. With its apparent *floruit* during the Epiclassic period (c. 750–900 CE), the extensive hilltop site of Xochicalco flourished in what is now the state of Morelos, Mexico,

and gave rise to another distinctive stylistic and iconographic tradition, mainly expressed in relief sculpture. The greatest amount of sculpture decorated one remarkable structure, the Pyramid of the Feathered Serpent. Aside from huge, undulating representations of the feathered serpent, various cross-legged seated personages, reflecting Lowland Maya stylistic influence, are depicted, many identified with their name signs and in some cases, seemingly, place signs as well. Calendric inscriptions are also present, and some scholars have suggested that the carvings may commemorate a major gathering of priests to discuss calendric reform and other ritual-religious matters. Another possibility is that this conclave involved some important dynastic event, perhaps a royal coronation. Other Xochicalco monuments, such as three elaborate stelae now in the Museo Nacional de Antropología, feature hieroglyphic inscriptions and different deities, including a version of the rain god, Tlaloc, and a fertility goddess.

TOLTEC. At the outset of the Postclassic period a new political and cultural power arose north of the Basin of Mexico, at Tollan, modern Tula, in the state of Hidalgo. Flourishing between about 900 and 1200, Tollan was a major metropolis, capital of an extensive empire. Its stylistic and iconographic tradition was quite eclectic and represented an amalgam of various earlier traditions (Teotihuacan, Xochicalco, El Tajín, and others).

Toltec iconography is known primarily from relief sculpture, decorated ceramics, figurines, and some remarkable cliff paintings at Ixtapantongo, southwest of Tula in the Toluca Basin. The relief carvings frequently depict armed, elaborately attired personages on quadrangular pillars and, in processional files, on bench friezes. Some of these figures are identified with their name (or title) signs and seem to depict actual individuals. The militaristic flavor of Toltec imagery was also expressed by alternating representations of predatory animals and birds: jaguars, pumas, coyotes, eagles, and vultures. Recognizable deity depictions are rare in the reliefs but can be more readily identified in the ceramic figures and especially in the Ixtapantongo cliff paintings. Many appear to be prototypical forms of Aztec deities: Tlaloc, Quetzalcoatl, Xipe Totec, various fertility goddesses, *pulque* deities, solar and Venus gods, and others. Toltec iconography was particularly haunted by the feathered-serpent icon symbolizing Quetzalcoatl; the related “man-bird-jaguar-serpent” motif was also important.

MIXTECA-PUEBLA AND AZTEC. During the Toltec period a new stylistic and iconographic tradition was apparently emerging to the southeast, centered in southern Puebla, Veracruz, and western Oaxaca (the Mixteca), which has been labeled “Mixteca-Puebla.” During the Postclassic period its pervasive influence was felt throughout Mesoamerica, as a kind of final iconographic synthesis of the earlier traditions already described. In contrast to its predecessors, it was characterized by a greater depictive literalness, plus a particular emphasis on symbolic polychromy. An extensive pantheon of anthropomorphic and zoomorphic supernaturals was represented with relatively standardized identificatory insignia.

The Aztec stylistic and iconographic tradition, which flourished in central Mexico during the last century or so before the Conquest, can be considered, from one aspect, a regional variant of Mixteca-Puebla. It differs principally in displaying an even greater naturalism in human and animal imagery. It also was expressed much more frequently in monumental three-dimensional stone sculpture, particularly deity images. Because of the wealth of available ethnohistorical documentation, the Aztec iconographic tradition can be interpreted with considerably more success than any other Mesoamerican system. Virtually all of its principal symbols have been correctly identified as well as the great majority of the numerous deity depictions, which include almost every member of the crowded pantheon mentioned in the primary sources. Those who advocate maximum utilization of the direct historical approach in the analysis of pre-Hispanic Mesoamerican iconography stress the importance of this extensive corpus of information concerning the Aztec system as a key point of departure for interpreting the much less well-documented pre-Aztec traditions.

ual-divinatory paper screenfolds. Includes iconographic analysis and preliminary decipherment of the texts.

H. B. NICHOLSON (1987)

ICONOGRAPHY: MESOPOTAMIAN ICONOGRAPHY

Any discussion of the religious iconography of ancient Mesopotamia is hampered by the fact that we have, on the one hand, religious texts for which we possess no visual counterparts and, on the other, representations—sometimes extremely elaborate ones—for which we lack all written documentation. Mesopotamia lacked raw materials such as stone, metal, and wood, and these had to be imported. As a result stone was often recut and metal was melted down; nor has wood survived. In time of war, temple treasures were carried off as booty, and divine statues were mutilated or taken into captivity, so that virtually none remains. Indeed we should know very little of Mesopotamian sculpture of the third and second millennia BCE were it not for the objects looted by the Elamites in the late second millennium BCE and found by the French in their excavations at Susa in southwestern Iran from 1897 onward. In time of peace the temples themselves frequently melted down metal votive objects in order to produce others. Occasionally a hoard of consecrated objects was buried near the temple, however, presumably to make room for others. The Tell Asmar and Al-‘Ubaid hoards dating to the second quarter of the third millennium BCE are two examples of this practice. In only a few cases has fragmentary evidence survived to indicate how temples were decorated (the leopard paintings at Tell ‘Uqair, for instance), but their elevations are often depicted on monuments and seals, and facades decorated with date-palm pilasters or water deities have been found. The decoration of secular buildings, among them the painted murals from the palace at Mari and the limestone reliefs that ornamented the palaces of the Assyrian kings, provide some evidence for religious iconography.

Our best sources for religious iconography are therefore the small objects that are more likely to have survived. Plaques and figurines made of local clay often illustrate a more popular type of religion. At certain periods painted pottery is the vehicle for representations that have religious significance. Decorated votive metal vessels, stone maces, and small bronze figures also occasionally survive. Without seals, however, our knowledge would be extremely scant. Prehistoric stamp seals were replaced during the second half of the fourth millennium by small stone cylinders that were used as marks of administrative or personal identification until the end of the first millennium BCE. These cylinder seals were carved with designs in intaglio and could be rolled across clay jar-sealings, door-sealings, bullae, tablets, or their clay envelopes so as to leave a design in relief. Such miniature reliefs are the vehicle for the most complex and tantalizing iconographic representations.

EARLY IMAGERY. Nude female figurines are among the earliest artifacts to which a religious significance can be attached. Among the prehistoric figurines of Mesopotamia are the tall, thin, clay “lizard” figures with elongated heads, coffee-bean eyes, slit mouths, and clay pellets decorating the shoulders. “Lizard” figurines have been found at southern sites in both male and female versions though the latter is dominant. Farther north, at Tell al-Sawwan, female figurines and male sexual organs were carved from alabaster. These figurines also have elongated heads and prominent eyes but are more rounded in shape. In the north, clay figurines often have abbreviated heads, and the emphasis is on a well-rounded, full-breasted body. An opposite trend is attested, however, at Tell Brak, where “spectacle” or “eye idols” were found in a late fourth-millennium temple. Here the eyes are emphasized to the exclusion of everything else, and there has even been debate as to whether they might not, in fact, represent huts. Although there is always a risk in attributing a religious significance to a figurine when there is no written evidence to corroborate this, it does seem likely that these figures had fertility connotations.

Animal combats. One motif that seems to have had a special significance throughout Mesopotamian prehistory and history shows a heroic male figure in conflict with wild animals. A pot of the Halaf period (c. 4500 BCE) shows an archer aiming at a bull and a feline. A figure traditionally known as the priest-king appears on a relief and a seal of the Uruk period (late fourth millennium) shooting or spearing lions and bulls, and the same theme reappears in the Assyrian reliefs of the ninth and seventh centuries BCE and forms the subject of the Assyrian royal seal. After the hunt the king is shown pouring a libation over the corpses, thus fulfilling his age-old function as representative of the god and protector of the country against wild cattle and lions. This function must have been particularly important when animal husbandry and agriculture were in their infancy but would have lost some of that immediacy in Assyrian times, when animals had become scarce and were specially trapped and released from cages for the hunt.

At certain periods the theme of animal combat became dominant in the iconographic repertoire. For several centuries during the third millennium, and at various times later on, heroes are shown protecting sheep, goats, and cattle from the attack of lions and other predators. Generally the heroes are either naked except for a belt, with their shoulder-length hair falling in six curls, or they are kilted and wear a decorated headdress. They are often assisted by a mythic creature who has the legs and horns of a bull and a human head and torso. Attempts have been made to equate the figures with the legendary king Gilgamesh and his wild companion Enkidu, but the evidence is lacking. We probably have here an extension of the theme already discussed, with the emphasis on the protection of domesticated animals from their aggressors. Prehistoric stamp seals showing figures who often wear animal masks and who are involved with snakes, ibex, and

other animals probably reflect a more primitive animistic religious tradition.

Early urban imagery. The advent of an organized urban society in the second half of the fourth millennium led to the development of more varied vehicles for the transmission of iconographic concepts. Some examples of monumental sculpture have survived, among them an almost life-size female head which was probably part of a cult statue. The wig and the inlay that once filled the eye sockets and eyebrows have vanished and make this sculpture particularly attractive to modern Western aesthetic taste. Uruk, where the head was found, was the center of worship of the fertility goddess Inanna, and a tall vase is decorated with a scene where the robed goddess in anthropomorphic form, accompanied by her symbol, the reed bundle, receives offerings from a naked priest and a (damaged) figure who wears a crosshatched skirt; this latter is probably the priest-king mentioned above. In his role as *en* ("lord") he is depicted feeding flocks and cattle, engaging in ritual hunts, or taking part in religious ceremonies; in his role as *lugal* ("owner") he triumphs over prisoners. He too has survived in sculpture in the round, on reliefs, and on cylinder seals.

Other significant motifs are known only from their impression on clay sealings. It seems that certain types of seals were used by particular branches of temple administration: boating scenes used by those connected with fishing and waterways, animal file seals for those dealing with herds. Certain designs, for instance those showing variations on a pattern of entwined snakes and birds, are more difficult to fit into this scheme of things. Other seals are squat, often concave-sided, and cut with excessive use of the drill to form patterns. These might have been used by an administration dealing in manufactured goods since potters and weavers are depicted. Some show a spider pattern, and it is tempting to associate these with the temple weavers, whose patron deity was the spider-goddess Uttu. Some more abstract patterns are difficult to interpret.

If we have dealt at some length with this early period it is because many of the iconographic concepts found later have their roots in the late fourth-millennium repertoire, including depictions of both the physiomorphic and the anthropomorphic form of deities, cult scenes with naked priests, the attitude of worship with hands clasped and large, inlaid eyes to attract the deity's attention, as well as the royal hunt, the sacred marriage, and banquet scenes. Even such quasi-abstract concepts as the rain cloud received its iconographic shape during this period, as testified by seal impressions showing the lion-headed eagle. Later he is shown on seals, vessels, reliefs, and particularly on a huge copper relief that adorned the temple at Al-'Ubaid.

LATER DEVELOPMENTS. Banquet scenes were especially popular in Early Dynastic times (mid-third millennium) and are often associated with scenes of war: seals, plaques, and mosaic panels depict these ritual banquets, which are probably to be interpreted as victory feasts in some contexts and as mar-

riage feasts in others. They are to be distinguished from later neo-Hittite funerary meals, but the preparation of food for the gods is a favorite iconographic motif in the second half of the second and early first millennia BCE.

Deities and their attributes. The representation of deities developed slowly, though by the middle of the third millennium they were wearing horned headdresses as a means of identification. In Akkadian times (2340–2180 BCE) distinct iconographies were established for the more prominent deities, and their position facing left became fixed, though the detailed representations of myths on seals of this period are generally incomprehensible to us. The role of some deities can be identified by the attributes they hold, others by the sprigs of vegetation, streams of water, rays, or weapons which issue from their shoulders. Often these serve only to establish that the deity is, for instance, a vegetation or a warrior god without being more specific.

In fact, it is only a very few representations which can actually be identified with any degree of certainty. Plows are frequently depicted, especially on Akkadian seals, but this is not always a shorthand for Ninurta (who is, however, depicted in a chariot on the famous Stela of the Vultures). Warrior gods on Old Babylonian seals are probably also to be equated with him in many cases, and he appears on Assyrian reliefs. The temple of Ninhursaga at Al-'Ubaid was decorated with friezes showing dairy scenes. There are clear representations of the water god Enki/Ea in his watery house or with water flowing from his shoulders on Akkadian seals. His Janus-faced attendant, Usmu, is also shown, as is the Zu bird who stole the tablets of destiny. Later the water god fades from the iconography and comes to be represented by a turtle. A neo-Assyrian seal showing a divine figure running along the back of a dragon is often taken to represent the Babylonian god Marduk with the primeval monster Tiamat, but there is no proof that this is so.

The moon god Nanna/Sin was a major deity, but there are surprisingly few representations of him. A stele from Ur and one of the wall paintings from the palace of Mari are perhaps the most convincing representations of this god, but where gods in boats can be identified with any certainty, they seem to be the sun god. The moon's crescent below the sun disk is also extremely common. The iconography of the sun god Utu/Shamash is, however, well attested. He is frequently shown with rays rising from his shoulders, placing his foot on a mountain and holding the saw-toothed knife with which he has just cut his way through the mountains of the east. Often he is accompanied by his animal attribute, the human-headed bull (probably a bison), or by attendants who hold open the gates of dawn. Scorpions likewise can be associated with the sun god, but they are also symbols of fertility and attributes of the goddess of oaths, Ishara. A famous plaque shows the sun god seated in his temple in Sippar; he also appears as the god of justice, holding a symbolic rod and ring, on the law code of Hammurabi of Babylon.

From Old Babylonian times onward the storm god Adad occurs frequently, often standing on a bull and holding a lightning fork. His consort Shala may appear briefly, on seals and in the form of mass-produced clay figurines of the Old Babylonian period, as a nude goddess, shown frontally. Ishtar (Inanna), the Uruk fertility goddess, appears on Akkadian seals holding a date cluster, calling down rain, and often winged with weapons rising from her shoulders as goddess of war. It is this last aspect that becomes predominant, and the Old Babylonian representations are so standardized that it is tempting to see in them the depiction of a well-known cult statue. It may be her aspect as “mistress owl” which is shown on the famous Burney relief (on loan to the British Museum). Her earlier symbol, the reed bundle, is later replaced by a star. One early seal may show her consort Dumuzi (Tammuz) as a prisoner in the dock, but otherwise he is difficult to identify. Ningirsu is often identified as a lion-headed eagle or thunderbird. There are several representations of what is probably Nergal as a warrior god. The god in the winged disk on Assyrian reliefs has generally been identified as Ashur but is more likely the sun god Shamash. Amurru, the god of the Amorites, appears on Old Babylonian seals accompanied by a gazelle and holding a crook.

Unidentifiable figures. From the wealth of symbols which represent deities, many can only be tentatively identified. The Babylonian boundary stones show these symbols on podia and list names of deities, but there is often no correlation between image and text. This is also the case on Old Babylonian seals of the earlier part of the second millennium BCE where we have frequent representations of unidentifiable figures and a large number of inscribed seals mentioning divine protectors: the names do not generally have any bearing on the representation. It seems that the owners of the seals were “hedging their bets” and invoking some deities in pictorial form, others in written form, and still others by their symbols.

It has also been suggested that the deities invoked most frequently were those most likely to be depicted; again this cannot be so since Ishtar, for instance, is frequently depicted and is almost never mentioned in the inscriptions. It is likely that certain deities had a well-established iconography (like the popular saints of medieval Christianity), probably based on a commonly known cult statue or wall painting, while others were invoked by name because their iconography was not as immediately recognizable. The picture becomes even more complex in neo-Assyrian times when demons played an ever-increasing part in religion: we have descriptions of the demons, but these are difficult to reconcile with the representations.

The rich and tantalizing iconography of Mesopotamia is also responsible for key images in the Judeo-Christian tradition. To cite only one example, the huge, winged, human-headed lions and bulls which decorated and protected the Assyrian palace entrances are the basis for Ezekiel’s vision (*Ez.* 1:4–13) and by extension for the symbols of the four

evangelists as we know them, combining human intelligence with the wings of the eagle and the strength of the bull or lion, the most powerful creatures in heaven and on earth.

SEE ALSO Mesopotamian Religions, overview articles.

BIBLIOGRAPHY

There is no recent study of Mesopotamian religious iconography. An early attempt at bringing order out of chaos is Elizabeth Douglas Van Buren’s *Symbols of the Gods in Mesopotamian Art* (Rome, 1945). This is still a useful book but has been superseded to a large extent by Ursula Seidl’s detailed study of the Babylonian boundary stones, *Die babylonischen Kudurru-Reliefs* (Berlin, 1968). The symbols which appear on these stones are analyzed, the various possible interpretations and identifications are discussed, and examples from all periods are listed.

Most studies on religious iconography have appeared in catalogs of cylinder seals, beginning with Henri Frankfort’s pioneering attempt to relate the seal designs to the texts in his *Cylinder Seals* (London, 1939). Edith Porada’s *Corpus of Ancient Near Eastern Seals in North American Collections*, vol. 1, *The Pierpont Morgan Library Collection* (Washington, D.C., 1948), is also a mine of information. The same author has more recently edited *Ancient Art in Seals* (Princeton, 1980), which includes an essay by Pierre Amiet relating the iconography of Akkadian seals to a seasonal cycle. In her introduction Porada summarizes the advances in glyptic studies which have taken place since Frankfort wrote. Many of the objects referred to here are illustrated in André Parrot’s *Sumer* (London, 1960) and *Nineveh and Babylon* (New York, 1961) or in J. B. Pritchard’s *The Ancient Near East in Pictures relating to the Old Testament* (Princeton, 1969).

DOMINIQUE COLLON (1987)

ICONOGRAPHY: EGYPTIAN ICONOGRAPHY

The principal iconographic sources for ancient Egyptian religion are the representations of scenes, both ritual and mythological, carved in relief or painted on the walls of Egyptian temples and tombs, as well as the numerous images and statues of gods and pharaohs. Additionally, there are many objects of ritual or practical function decorated with carved or painted religious motifs, and finally, numerous hieroglyphic signs belonging to the Egyptian writing system are representations of gods, religious symbols, and ritual objects. These types of sources remain constant throughout the more than three thousand years of ancient Egyptian history from the Old Kingdom to the Roman period (c. 3000 BCE–395 CE).

Egyptian gods were depicted both as human beings and as animals; a composite form combining a zoomorphic head with a human body enjoyed special popularity in relief and statuary alike. Anthropomorphic representations of Egyptian gods relate to their mythological functions and reveal narrative aspects of their relationships, whereas other forms may be defined as their “metamorphoses” or symbols, emphasizing one particular feature or event. In this symbolic realm

one divinity could be represented by various animals or objects—for example, the cow, the lioness, the snake, and the sistrum (a musical instrument) are all manifestations of the goddess Hathor. Conversely, one animal could embody various gods; thus, the protective cobra that appears on the forehead of each pharaoh could be identified with almost all goddesses. The divine identity of an animal may differ in various local pantheons. Particularly numerous were iconographic variations of the sun god, which illustrate various phases of the sun's *perpetuum mobile*. Some male gods associated with generative powers (Min, Amun-Re, Kamutef) are depicted ithyphallically. A particular shape, that of a mummified human body, was attributed to Osiris, the god of the dead. This form also occurs in some representations of other gods, especially when they appear in the realm of the dead. Diads and triads of gods, frequent in Egyptian statuary, as well as larger groups of divine beings represented in reliefs and paintings, are visual expressions of various relationships among numerous divinities. Syncretistic tendencies in Egyptian religion, popular after the Amarna period, take concrete form in the composite features that combine the iconographic features of different gods.

Scenes carved on the walls of tombs and temples as well as on furniture and ritual objects most frequently show the gods in the company of a king making offerings or performing other ritual acts (such as censuring, purifying with water, or embracing the god). All representations of the king facing a divinity illustrate the ongoing relationship of reciprocity between them. In return for the precious object that he presents to the god, the pharaoh receives symbols of life, strength, stability, many years of kingship, and the like.

STATUARY. Numerous Egyptian statues made of all possible materials, such as stone, wood, gold, bronze, and faience, represent one, two, or three gods often accompanied by a king. Both gods and king wear crowns and hold characteristic insignia, among which the most frequent are the sign of life (*ankh*) and various types of scepters. Many elements of the king's dress are identical with those of the gods, thus visualizing the divine aspects of the monarch's nature. The shape of their artificial beards is distinctive, however: the beard of the god is bent forward at the end, while that of the king is cut straight in its lower part.

The size of the statues varies according to their function. Small bronze statuettes of votive character were common, especially in the first millennium BCE. Many represent animals sacred to Egyptian gods; sometimes these figures are set on boxes containing mummies of the animals represented. The mummified bodies of larger animals, such as bulls, ibis, crocodiles, and cats, have been found buried within special necropolises near places connected with the cults of various gods.

Large stone statues served as cult objects in Egyptian temples. Pairs of colossal effigies of the seated king usually stood in front of the temple pylons. The sphinx, with its body of a lion and head of the king, was often placed in the

front of the temple to symbolize the monarch's identity as solar god. Rows of sphinxes lined both sides of processional ways leading to the principal temple entrances.

FUNERARY ART. Another important part of our knowledge about ancient Egyptian iconography comes from the decoration of Egyptian tombs and coffins that comprises the great Egyptian religious "books"—literary compositions that combine spells of magical, mythological, and ritual character with pictures illustrating Egyptian visions of the netherworld. The most ancient of these "books" are the Pyramid Texts carved on the walls of some of the rooms inside the royal pyramids (Old Kingdom, c. 3000–2200 BCE). The illustrations accompanying this sort of text appear for the first time in the Book of Two Ways, which is part of the Coffin Texts (Middle Kingdom, 2134–1600 BCE) painted on the sides of wooden coffins.

Subsequent literary compositions of religious character are generally accompanied by elaborate tableaux, often in the form of vignettes drawn above a column of text written on papyrus. From the New Kingdom (1569–1085 BCE) on, the most popular of these "books" was the *Book of Going Forth by Day* (the so-called *Book of the Dead*), a copy of which was a necessary element of the funerary offerings of every noble. The visual aspects of royal eschatology are best known from a composition called *Amduat* (That Which Is in the Netherworld), which was painted or carved on the walls of royal tombs. Illustrations show the nightly wandering of the sun god through the netherworld. Beginning with the New Kingdom and continuing into the Roman period, fragments of these "books" also decorate many tombs, coffins, and ritual objects belonging to the nobles.

TEMPLES. As the abode of the gods, Egyptian temples were accessible only to the kings and priests. The king, considered the mediator between the gods and the people, is usually shown in front of the gods in the ritual scenes that decorate the temple walls, although in reality it must have been the priests who performed the rituals in the king's name.

The sanctuary, usually situated at the far end of the temple along its axis, contained the sacred image of the god to whom the temple was dedicated. The statue of Amun-Re, the chief divinity of Thebes and the state divinity since the time of the New Kingdom, stood inside a shrine on a portable bark placed upon a sled. In Theban temples this effigy is often represented in connection with the Opet Feast or the Beautiful Feast of the Valley, during which it was transported along or across the Nile on a huge ceremonial boat adorned with reliefs and statues.

Narrative cycles. Many temple scenes form standardized sequences of pictures showing summarily, sometimes almost symbolically, successive episodes of mythicized rituals that often refer to important historical events, such as the miraculous birth of the king, his coronation, his victories over enemies, his jubilee, and the founding of the temple. These representations appear in the inner parts of the temple, together with tableaux depicting the daily ritual performed be-

fore the statue of the temple's principal deity and scenes showing various offerings being made. Often the iconographic repertory of the decoration of the pillared hall—the central part of many temples—constitutes something of a “showcase,” reviewing in abbreviated form all the important elements of the temple's relief decoration.

The interior of the walls enclosing the courts are often decorated with episodes of the most important feasts, while the grandiose tableaux found on the exterior of the walls and on the gates (frequently in the form of pylons) commonly illustrate the king's military achievements. Standard scenes on the pylon faces show the king smiting foreign captives, presenting them to a god, and images of the king offering a figure of the goddess Maat—the personification of truth, justice, and order—to the main divinity of the temple. Another iconographic pattern frequently occurring on the pylons and on the socle of royal thrones is the symbolic representation of subjugated peoples, the so-called ring-names, showing legless human figures, with hands bound, behind an oval ring containing the name of the foreign province. The facial features of these figures were meant to characterize the physiognomy of each particular people.

Symbolic motifs. In addition to these scenes referring to particular events, the temple walls are also decorated with numerous motifs of a more symbolic nature, which give visual form to religious, political, or geographical ideas. The so-called geographical processions, for instance, symbolize the provinces of Egypt in the form of hefty divinities personifying the Nile, each bearing offerings in their hands.

Various iconographic patterns invented by the Egyptians give shape to the idea of the unification of Lower and Upper Egypt. The central motif of a great number of them is the heraldic symbol called *sma-tawy*, which is composed of two plants, papyrus (for Lower Egypt) and a kind of bulrush (for Upper Egypt), bound together around the spinal cord and the lungs of an animal. Two divine personifications of the Nile—the motive power of this unification—are often shown holding and binding together the two plants

Geographical and religious at the same time, the concepts of the country's division into two parts—either north and south or east and west—belong to the most important principles prevailing in Egyptian iconography. They find expression in symmetrical or antithetical compositions of scenes placed in the axial rooms of temples and tombs, as in the disposition of the various gods representing north and south or east and west, especially on the decoration of lintels, doorposts, and rear walls.

The netherworld. The Egyptian realm of the dead lay in the west. The best illustration of ancient Egyptian visual concepts of the netherworld appears in the decoration of New Kingdom royal and noble tombs situated in west Thebes; these iconographic patterns remained a favorite and repeated subject right up to the Roman period. Of the two principal groups of scenes depicted there, the first, usually

found in the first room of the tomb, refers to various episodes in the earthly life of the deceased, including such religious ceremonies or feasts as the Beautiful Feast of the Valley, the royal jubilee, the New Year festival, or the harvest feast. Included in all these scenes are processions, offerings (including burnt offerings), incense burning, and performances with playing, singing, and dancing. Of special importance among Egyptian musicians was the harpist, who came to be represented by the squatting figure of a blind man shown in profile.

The other group of scenes, found in the inner room, illustrates various episodes of the funeral rites, such as the embalming ritual, the symbolic “pilgrimage to Abydos” by boat, and various processions with the mummy being dragged on sledges. The ritual of “opening the mouth” was one of the most important ceremonies of the long funeral cycle. Performed on the statue of the deceased or on his mummy, it was composed of episodes including censuring, pouring libations, purifying, and “opening the mouth” with special instruments, all of which were intended to revive the spirit of the deceased.

Cult of the dead. Of particular importance in every tomb were the places intended for the cult of the deceased. These featured niches with statues of the dead person (and sometimes of members of his family), stelae often depicting the deceased adoring and making offerings to various gods or royal personages, and lastly, false-door stelae constituting a symbolic passage between the realm of the dead and the world of the living.

Enabling the deceased to enjoy the sight of the shining sun is another idea that predominates in the eschatological visions depicted and described on the walls of royal tombs. Such great religious compositions as the *Amduat*, the *Book of Gates*, and the *Book of Caverns* depict, among other things, the nightly journey of the sun god, who is often identified with the king. The monarch is thus endowed with the ability to reappear in the morning as a form of the solar divinity.

Most important in each tomb, however, was the burial chamber, commonly situated underneath the accessible rooms at the bottom of a deep vertical shaft. Here were contained the sarcophagus with the mummy of the deceased and all the funerary offerings, including the four Canopic jars for the viscera of the deceased, the mummiform figures known as *shawabtis* (*ushabtis*), a copy of the *Book of Going Forth by Day* written on papyrus, and various ritual objects. The sarcophagi and coffins, made of wood or stone, took the form of cubical or body-shaped cases decorated with painted or carved religious motifs. The four Canopic jars were associated with the four sons of the royal deity Horus, with the four cardinal directions, and with the four protective goddesses; they each had distinctive stoppers, often representing the heads of the four sons of Horus or simply anthropomorphic heads. Numerous *shawabtis* holding various objects, such as hoes, baskets, or religious symbols, and most frequently made of faience or stone, accompanied the deceased in his

tomb in order to help him in the netherworld. In some tombs the number of these figures were considerable: more than one thousand were recovered in the tomb of King Taharqa (r. 689–664 BCE). Particularly rich were the grave goods of the royal tombs; the most complete version of such a funeral outfit has been found in the tomb of Tutankhamen (r. 1361–1352 BCE) located in the Valley of the Kings, the New Kingdom necropolis in west Thebes.

The evolution of iconographic patterns in the three-thousand-year course of ancient Egyptian history parallels general changes in religious concepts, which are themselves a function of political and social changes. A “democratization” of religious beliefs during the Middle Kingdom and the Second Intermediate period resulted, on the one hand, in the depiction of direct relations between gods and human beings and, on the other hand, in identifying the dead with the god Osiris. Religious conflicts during the eighteenth dynasty, probably reflecting political struggles and culminating in the “heresy” of Amenhotep IV-Akhenaton, led first to a disproportionate emphasis on solar cults and then to a development of religious concepts concerning the realm of the dead, with a dual focus on Osiris and the solar god. The union of these two once-competing deities occurs frequently after the Amarna period and contributes to a development of theological concepts as well as their iconographic renderings. This syncretism increases during the Third Intermediate period and generates an unparalleled variety of forms during the Ptolemaic period.

BIBLIOGRAPHY

The most complete and up-to-date compendium of information concerning the iconography of ancient Egyptian religion is *Egypt*, volume 16 in the series “Iconography of Religions,” edited by the Institute of Religious Iconography, Groningen. Each of the thirteen fascicles of this volume, arranged in chronological sequence, contains rich photographic materials and a detailed bibliography. Encyclopedic information on particular subjects can be found in Hans Bonnet’s *Reallexikon der ägyptischen Religionsgeschichte*, 2d ed. (Munich, 1971), and in *Lexikon der Ägyptologie*, 6 vols., edited by Hans Wolfgang Helck, Eberhard Otto, and Wolfhart Westendorf (Wiesbaden, 1972–). Bonnet’s *Ägyptische Religion* (Leipzig, 1924) may be consulted as a valuable complement to these publications. There is an amazing scarcity of scientific literature in English, but see Manfred Lurker’s *The Gods and Symbols of Ancient Egypt*, revised by Peter A. Clayton (London, 1980).

ICONOGRAPHY: GRECO-ROMAN ICONOGRAPHY

The religious structures of both Greeks and Romans conform to the typical patterns of divinity and belief found

among the Indo-European peoples. Most notable of these is an organized pantheon of deities related by birth or marriage and presided over by a god of the sky who is both ruler and father (e.g., Zeus Pater and Jupiter). Nevertheless, although it is clear that such gods accompanied the movement of the Indo-Europeans into Greece and Italy, it is impossible to state with certainty what iconographic representation, if any, was used to worship them during this earliest period. The attempt to discern early iconographic patterns is further hampered by the fact that both peoples were invaders whose later religious outlook was influenced by older, settled cultures. When the Greeks arrived at the beginning of the second millennium BCE, they found not only an indigenous population on the mainland (whom they called the Pelasgians) but also the flourishing civilization of nearby Crete, whose art and architecture show evidence of Egyptian and Near Eastern influences. Thus, not only all the gods who constituted the classical Greek pantheon but also their iconography must be considered the products of a long process of syncretism and synthesis of Indo-European, pre-Hellenic, Cretan, and Near Eastern concepts of divinity. Similarly, the Indo-European settlers in Italy mixed with a variety of peoples already well established on the peninsula. Therefore, any attempt to understand the development of the form and content of Greco-Roman iconography must necessarily entail a consideration of the often disparate parts of the traditions.

MINOAN-MYCENAEAN ICONOGRAPHY (2000–1200 BCE).

The study of Cretan (Minoan) religion may be compared to a picture book without a text. The two symbols of Minoan civilization, the double ax and the horns of consecration, clearly had religious significance, perhaps as tools of worship, but their function is not understood. From the archaeological evidence, however, which includes frescoes, seals, and figurines, one may conclude that the representation of the divine was both anthropomorphic and theriomorphic. Found are depictions of female deities encoiled by snakes or with birds perched upon their heads; these figures may explain the prominence of snakes in later Greek religion as well as the association of Greek deities with specific birds. In addition, animal-headed figures reminiscent of contemporaneous Egyptian material have been uncovered. One such type, a bull-headed male, may be the source for the Greek myth of the Minotaur. Also found are representations of demonlike creatures who appear to be performing various ritual acts; these have been cited as evidence of Mesopotamian influence. A number of seals portray the figures both of a huntress, who is called “mistress of the beasts” and whom the Greeks associated with Artemis, and of a male deity, who stands grasping an animal by the throat in each hand. Finally, the seals present strong evidence for the existence of tree cults and pillar cults, the survival of which perhaps may be seen in the Greek myths about dryads, the woodland spirits of nature who inhabit trees. To what extent the traditions of Minoan iconography immediately influenced the Greeks can be explored through a consideration of Mycenaean remains. Indeed, although the Linear B tablets from Pylos have

provided valuable linguistic evidence about the names of the earliest Greek deities, most of our information, as in the case of Crete, comes from archaeological sources. From the excavations at Mycenae have come a number of clay snakes, and at Tiryns a fresco depicts a crocodile-headed creature reminiscent of those seen on Crete. Persistence of the Minoan traditions may also be found in the Lion Gate of Mycenae, over which two lions, carved in relief and leaning on a central pillar, stand guard. Providing further evidence for the continuing influence of Minoan iconography are a number of Mycenaean seals, rings, and ornaments that display representations of sacred trees, bird-decorated shrines, and demons carrying libations. To what extent, however, the continuity of form indicates a continuity of content is difficult to determine. In 1969, further excavations at Mycenae uncovered the Room of the Idols, which contained a quantity of clay statues with arms either raised or outstretched. Although possessing only an approximation of human form, each has a distinctive individuality; it has been suggested they may be the earliest representations of those Olympian gods later described by Homer. However, perhaps most characteristic of Mycenaean religious iconography are the thousands of clay statuettes called *phi* and *psi* figurines (after their distinctive shapes). Although most are rendered recognizably female by the accentuation of the breasts, they do not necessarily portend future anthropomorphic representation. They are often found in graves, but there is no general agreement as to their function. It is possible that they once served as votive offerings but that, like much of later Greek art originally sacred in nature and function, they became separated from their original purpose.

ARCHAIC AND CLASSICAL ICONOGRAPHY. The difficulty of establishing the continuity of the iconographical tradition from the Mycenaean into the later periods of Greek history is illustrated by a comment of the historian Herodotus (fifth century BCE), who credits Homer and Hesiod with describing the gods and “assigning to them their appropriate titles, offices, and powers,” but who concedes that the two poets had lived not more than four hundred years before him. Homer and Hesiod are in fact our earliest sources for the iconography of the Greek gods after the Mycenaean age. But another four hundred years separate the destruction of Mycenae and the life of Homer, and the poet’s descriptions of the Olympian gods bear little resemblance to the representations of the divine found at Mycenaean sites. Hesiod’s account of the birth of the gods in his *Theogony* indicates that, while earlier generations of deities were often monstrous in appearance as well as behavior, the victorious Olympian gods, with Zeus as their ruler, were clearly anthropomorphic. Homer elaborates upon this concept, describing not only their very obviously human physical appearance but also their often all-too-human behavior. It has been suggested that the source for the relentlessly anthropomorphic quality of the Greek gods in both literature and art is a general rejection of the concept of an abstract deity. Despite criticism by philosophers such as the pre-Socratic Xenophanes, who commented

rather cynically that “mortals consider that the gods are born and that they have clothes and speech and bodies like their own,” or Plato, who banned poets from his ideal state because they told lies about the gods, the Greeks persisted in depicting their gods as human in form and action. Nevertheless, there is a great deal of evidence to indicate that, in the conservative ritual of Greek religion, the older forms of representation of the divine persisted. Aniconic images of the divine, such as the *omphalos* at Delphi, provide proof of its survival. This stone, which in Greek myth was described as the one that Rhea gave to Kronos to swallow when he wished to devour his infant son Zeus, and that the ruler of the Olympians then placed at the center of the world, is clearly a baetyl, a sacred stone that contains the power of the divine. Similarly, the widespread appearance of the herm, a pillar on which was carved an erect phallus and that acted as an agent of fertility and apotropaic magic, points to the survival of earlier conceptions of the divine. Myth also provides a clear illumination of the remnants of a theriomorphic iconography: Zeus changes himself into a bull in order to rape Europa and into a swan in order to seduce Leda; Athena and Apollo metamorphose themselves into vultures to watch the battle between Hector and Ajax. The amalgamation of a number of functional deities during the Archaic and Classical periods can be seen in the great variety of epithets by which each god was addressed. In the use of such epithets, we see once again the particularism of Greek religion. The disparate types, which link seemingly unconnected functions from both the world of nature and the world of humans in a single deity, are probably a result of the continuing processes of synthesis and syncretism described above. Owing to the conservative nature of Greek religion, no epithet was ever discarded. Thus, the most primitive expression of the power of nature embodied in the god as well as the most sophisticated conceptions of divine political power can be found in the iconography, but it is clear that not all aspects of a deity can be equally well expressed through the various cultic epithets. Nevertheless, many of the epithets of the Olympians can be considered as proof of older iconographic substrata that reveal functions closely linked to the world of nature: horselike Poseidon, owl-eyed Athena, cow-eyed Hera, cloud-gathering Zeus. Although deities were often portrayed with their attributes of nature—the thunderbolt of Zeus, the trident of Poseidon—the connection between iconography and function may at times be difficult to establish because it is clear that many of the earlier “nature” functions of individual deities could not be expressed with clarity in the monuments. The frequent dichotomy between mythic meaning and ritual function also presents one with difficulties in understanding the iconography of a particular god. In Greek myth, Poseidon is clearly the god of the sea, who appears in sculpture and vase painting brandishing his trident or rising from the sea in his chariot. Yet, Poseidon was also worshiped as a god of horses, and he is depicted on coins in the form of a horse. Likewise, the Artemis of myth is the eternal virgin, yet it is clear from both cult and iconography that she was worshiped

as a goddess of fertility. It would seem that myth often serves to create a coherent portrait while religious ritual and practice see no such need. The medium, too, often shapes iconographic conceptualization: the narrative of myth can be more readily portrayed in vase painting and reliefs than through freestanding sculpture. The evolution of the form and content of Greek iconography as a means of expressing spiritual ideals generally parallels that of Greek art, especially in sculpture. The earliest religious sculpture and architecture were executed in wood and have vanished; but in the seventh century BCE we see the development of monumental stone architecture and sculpture. The most representative forms of sculpture are the *kouros* and the *kourē* (female) figures that stand rigidly with stylized features and dress. Perhaps votive offerings, they have been variously identified as divine or human but may represent something in between: an idealized existence shared by gods and mortals alike. One cannot divorce iconography from the history of Greek art and architecture, for there is no such concept as purely hieratic art: the Classical Apollo, for example, is not only presented as the youthful god, naked and beardless, but comes to embody the idealization of youth. Similarly, a bronze statue of a muscular, bearded god with his left arm stretched out in front of him and his right arm extended behind as if to hurl something is identified as either Zeus or Poseidon; without lightning bolt or trident, it is impossible to distinguish between the spheres of sky and sea. Increasing emphasis on the beauty of the human form in repose and in action informs both Greek sculpture and the understanding of the divine. Furthermore, iconography is linked not only with the development of the artistic ideal but with that of the political as well. As the institutions of the state evolved, the original gods of nature were made citizens of the polis and given civic functions as protectors and benefactors of the city. Thus, the gold and ivory statue of Athena in the Parthenon portrayed the armed goddess in full regalia as the protector and patron of Athenian civilization, the goddess who had led her people to victory against the Persians. The Parthenon itself is a symbol of the bond between Athena and her city, for the temple frieze depicts the procession of the Panathenaea, a festival held in honor of both the goddess and the powerful city that worshiped her, the pediment portrays scenes from the life of Athena, and the metopes record various victories of Greeks over barbarians. Similarly at Olympia, which served as the religious and political center of Greece during the Classical period, the Phidian Zeus sat enthroned in the inner sanctuary of the great temple, the concrete expression of the god's power and majesty. Crafted of gold and ivory, nearly twelve meters high, the Lord of the Universe held in one hand a statue of Victory and in the other a golden scepter on which sat an eagle. Behind the throne were the Graces and Hours, goddesses of the seasons and regulators of nature. The worlds of nature and culture become one. Phidias himself reportedly said that he had meant to portray the king in his supremacy as well as in his magnanimity and nobility. The god may be seen as the source out of which all reality—sacred and pro-

fane—flows. The temple itself was also an expression of the all-encompassing might of Zeus: twenty-eight meters wide, sixty-nine meters long, and twenty meters high, its colossal size emphasized those attributes of power and universality that Phidias had sought to convey in his sculpture.

HELLENISTIC AND ROMAN ICONOGRAPHY. The declining political fortunes of the Greek states after the Peloponnesian War paved the way for the rise of Macedon and the magnificent career of Alexander the Great. His military conquests produced a new cultural synthesis of East and West that radically altered the perception and portrayal of the divine; for although the Classical understanding of the nature of deity survived, it was now informed by new religious, social, and political ideals. Absolute monarchy, an altered concept of the divine as embodied in Eastern mystery cults, and the rise of a middle class eager to display its wealth all contributed to the development of different iconographic sensibilities. Religious iconography in the Hellenistic period presents a curious admixture of Eastern and Western values, of monumentalism and individualism, of divine rationality and pathos, amalgams that expressed themselves in the formal magnificence of the tomb of Mausolus at Halicarnassus as well as in the representations of Aphrodite that emphasize her naked human beauty, in sleeping satyrs and playful cupids as well as in the struggling Laocoön doomed by the gods. The Great Altar of Zeus at Pergamum, with its wide monumental stairway, was encompassed by a frieze that, in depicting the ancient Greek myth of the war between the Olympians and the Giants, displays a remarkable range and intensity of human emotions. In a world where kings were hailed as living gods and apotheosis was a constant possibility, and where gods suffered and died, the division between sacred and profane iconography became even less distinct. With the conquest of the Hellenistic kingdoms the Romans acquired the values that had informed later Greek religious art and architecture. Although the earlier Etruscan culture of Italy had been strongly influenced by Greek and Oriental ideologies, it shows evidence of a religious outlook distinct from both. Tomb paintings from the Archaic period, for example, portray lively Dionysian revels and rowdy funeral games that, while drawing on Greek sources, perhaps indicate a more optimistic view of the afterlife than that of the Greeks. Roman iconography, on the other hand, reflects the conscious choice of the Greek ideal. Roman religion seems to have remained rooted in nature to a much greater extent than civic Greek religion had; the early anthropomorphic representations of Mars and Jupiter are exceptions, perhaps occasioned by their clear identification with the political rather than the agricultural life of the Roman people. Mars was the father of Romulus and Remus and thus the ancestor of the Roman people; but even so it was the she-wolf, nurse of the twin boys, who became the emblem of Rome's auspicious origins. Only when old Italic spirits of nature became identified with their anthropomorphic Greek counterparts did the Romans build temples as houses for their gods and represent them in human form. The conservative values of Roman religion not

only inhibited the development of a distinctive iconography but at the same time led to the adoption of those elements in Hellenistic art that seemed best to reflect those values. Although Augustus's attempt to recreate the old Roman religious values through the resurrection of archaic rituals and priesthoods and the rebuilding of ancient temples and shrines was ultimately unsuccessful, his Altar of Augustan Peace (Ara Pacis) illustrates the Roman understanding of the connection between traditional expressions of piety and political success. One of its panels depicts Augustus offering solemn sacrifice; another reveals Mother Earth holding on her lap her fruitful gifts. The peace and prosperity of mortals and gods are attributed to Augustus's piety and devotion. More than three hundred years later, the Arch of Constantine was to reflect the same themes: celebrating the victory of the emperor over his enemies, its inscription attributes his triumph to the intervention of an unnamed divine power and his own greatness of spirit. Over three millennia, the iconography of Greek and Roman religion became increasingly concrete, locating the divine first in nature, then in objects, and finally within the human realm.

TAMARA M. GREEN (1987)

ICONOGRAPHY: HINDU ICONOGRAPHY

Viṣṇu, Śiva, and Devī are the basic visual images of Hinduism. Each of these deities is worshiped in a concrete image (*mūrti*) that can be seen and touched. The image is conceived in anthropomorphic terms but at the same time transcends human appearance. With certain exceptions, Hindu images have more than two arms. Their hands, posed in definite gestures, hold the attributes that connote the deity's power and establish its identity. While the images are concrete in their substantiality, they are but a means of conjuring up the presence of deity: this is their essential function. The image serves as a *yantra*, an "instrument" that allows the beholder to catch a reflection of the deity whose effulgence transcends what the physical eye can see. The divine effulgence is beheld in inner vision. As a reflection of this transcendental vision, the image is called *bimba*. This reflection is caught and given shape also by the *yantra*, a polygon in which the presence of deity during worship is laid out diagrammatically. The *yantra* is constructed with such precision that the "image" emerges in its unmistakable identity.

Deity, beheld by the inner eye, by an act of "imagination," is translated in terms of the image. In this respect the image is called *pratimā*—"measured against" the original vision of the deity as it arose before the inner eye of the seer. Iconometry in the case of the anthropomorphic three-dimensional image corresponds to the geometry of a linear *yantra*. Thus the anthropomorphic image is at the same time a reflection of a transcendental vision and a precise instrument for invoking the divine presence during worship in the manmade and manlike figure of the image. It has its place in the temple, where it is worshiped not only as a stone stela in high relief in the innermost sanctuary but also on the outside of the walls. There, a special niche or facet of the wall is allotted to each of the images embodying aspects of the image in the innermost sanctuary.

Viṣṇu, Śiva, and Devī (the Goddess) are represented in many types of images, for each of these main deities has multiple forms or aspects. These are carved in relief in niches on the outer side of the temple walls, each niche suggesting a sanctuary correlated in the main directions of space to the central image—or symbol—in the innermost sanctuary. While the images of Viṣṇu and Devī are anthropomorphic and partly also theriomorphic, the essential form in which Śiva is worshiped is in principle without any such likeness.

ŚIVA. The main object of Śiva worship is the *liṅga*. The word *liṅga* means "sign," here a sign in the shape of a cylinder with a rounded top. The word *liṅga* also means "phallus" however; some of the earliest Śiva *liṅgas* are explicitly phallus shaped. However, this sign is not worshiped in its mere anthropomorphic reference. It stands for creativity on every level—biological, psychological, and cosmic—as a symbol of the creative seed that will flow into creation or be restrained, transmuted, and absorbed within the body of the yogin and of Śiva, the lord of yogins. In its polyvalence the *liṅga* is Śiva's most essential symbol, while the images of Śiva, each

in its own niche on the outside of the temple wall, are a manifestation of Śiva in a particular role offering an aspect of his totality.

The images of Śiva visualize the god's two complementary natures: his grace and his terror. Like all Hindu divine images, that of Śiva has multiple arms; their basic number, four, implies the four cosmic directions over which extends the power of deity in manifestation. Śiva's image of peace and serenity in one of its forms, Dakṣiṇāmūrti, is that of the teacher. Seated at ease under the cosmic tree, he teaches the sages yoga, gnosis, music, and all the sciences. In another image, standing as Paśupati, "lord of animals," Śiva protects all the "animals," including the human soul.

He is also the celestial bridegroom, Sundaramūrti, embracing his consort (Āliṅgamūrti) or enthroned with her (Umāmaheśvara), while as Somāskanda the seated image of the god includes his consort, also seated, and their dancing child. These images assure happiness within the human condition, whereas Ardhanarisvara, the "lord whose half is woman," the androgyne god, his right half male and left half female, is an image of superhuman wholeness.

Myths and legends in which Śiva annihilates or pardons demons of world-threatening ambition are condensed in images of him as victor over destructive forces and death (Tripurāntaka, Kālārī). Another class of images visualizes the god as a young, seductively naked beggar (Bhikṣātaṇa) and, in a later phase of the selfsame myth, as an image of terror, an emaciated, skeletal—or, as Bhairava, bloated—god who is sinner and penitent on his way to salvation. Bhairava is an image of the lord's passion on his way to release. There he dances as he danced on the battlefield in his triumph over fiends. Śiva's dance is the preeminent mode of the god's operation in the cosmos and within the microcosm, in the heart of man. The image of Śiva Nāṭarāja dancing his fierce dance of bliss subsumes ongoing movement and stasis in the rhythmic disposition of limbs and body as if the dance were everlasting; in his upper hands are the drum and flame, the drum symbolizing sound and the beginning of creation, the flame symbolizing the end of creation; one arm crosses over the body and points to the opposite, while his raised foot signals release from gravity and every other contingency in the world. The whole cycle of the eternal return is laid out in the *yantra* of Śiva's dancing image. In another image, that of the cosmic pillar, Śiva reveals himself to the gods Brahmā and Viṣṇu; an endless flaming pillar of light arises from the netherworld. The image of Lingodbhava shows the anthropomorphic figure of Śiva within the *liṅga* pillar bursting open.

The *liṅga* as both abstract symbol and partly anthropomorphic shape is the main Saiva cult object. In some of the sculptures, a human head adheres to the cylinder of the *liṅga*, or four heads are positioned in the cardinal directions, implying a fifth head (rarely represented) on top. Five is Śiva's sacred number, and the entire Saiva ontology—the five senses, five elements, five directions of space, and further hierarchic

pentads—is visualized in the iconic-aniconic, five-faced *liṅga*. This concept underlies the image in the innermost sanctuary of the Caturmukha Mahādeva Temple in Nachna Kuthara, near Allahabad (sixth century), and that of Sadāśiva in the cave temple of Elephanta, near Bombay (mid-sixth century). These are ultimate realizations and constructs embodied in sculptural perfection.

The facial physiognomy of the image reflects the nature of the particular aspect or manifestation of the god. His calm, inscrutable mien as well as Bhairava's distorted countenance are shown with many nuances of expression that convey the significance of each particular manifestation, defined as it is by specific attributes and cognizances. The ornaments, however, the necklaces, belts, earrings, and so on, are not essentially affected by the specific manifestation. Likewise some of Śiva's attributes, particularly the trident, serpent, crescent moon, rosary, and antelope, are part of the god's image in more than one manifestation. Invariably, however, Śiva's crown is his own hair. He is the ascetic god, and his crown shows the long strands of the ascetic's uncut hair piled high on his head in an infinite variety of patterns, adorned by serpents, the crescent moon, and the miniature figure of the celestial river Gaṅgā (Ganges) personified. Lavish presentation here nonetheless constitutes iconographic economy, for each of the various symbols implies an entire myth, such as that of the descent from heaven of the river goddess Gaṅgā, whose impact would have wrought havoc on earth had not Śiva offered his hair as a temporary station for her.

An essential cognizance particular to Śiva among gods—though not present in every Śiva image—is the god's third eye (which also graces deities derived from the Śiva concept, such as Devī and Gaṇeśa). Vertically set in the middle of Śiva's forehead above sun and moon, his two other eyes, the third eye connotes the fire of the ascetic god. It broke out when Pārvatī, his consort, playfully covered the god's other eyes with her hands: darkness spread all over the cosmos. This fire also blazed forth to destroy the god Kāma, "desire," in his attempt to wound Śiva with his arrow.

Whether distinguished by one symbol only or by a combination of symbols, the identity of Śiva is unmistakable in his images. There is also no inconsistency if, for example, the crown of Śiva, lovingly enthroned with Pārvatī, is wreathed with skulls (Umā-Maheśvara from Belgavi, Karnataka, twelfth century). The total being of Śiva is present in the particular aspect.

Facing the *liṅga*, the image of Nandin, the zebu bull carved in the round and stationed in front of the entrance of the temple or in its hall, is at the same time the animal form of Śiva, his attendant, and conveyance (*vāhana*). In more than one respect, Nandin, the "gladdener," conveys Śiva.

VIṢṆU. The pervader and maintainer of the universe is represented by his anthropomorphic image in the innermost sanctuary. Invariably the image stands straight like a pillar, and

its four arms symmetrically hold the god's main attributes: conch, wheel, mace, and lotus. The conch—born from the primordial ocean—with its structure spiraling from a single point, is a symbol of the origin of existence. The wheel represents the cycle of the seasons, of time. The mace stands for the power of knowledge, while the lotus flower symbolizes the unfolded universe risen from the ocean of creation. According to their respective placement in the four hands of the Viṣṇu image, these four attributes define the particular aspect under which the god is worshiped according to the needs of the worshiper. Each of the twenty-four images—the total permutations of the four symbols in the four hands—has a name. The supreme god, Viṣṇu has a thousand names in which those of the twenty-four images are included.

In addition to the standing image in the innermost sanctuary—an anthropomorphic version of the concept of the cosmic pillar—Viṣṇu may assume two other positions, seated and recumbent. Indeed, no other Hindu god—except a Viṣṇu-derived allegory, *Yoganidrā*—is shown recumbent, and together, these three positions render the mode of the god's pervasive presence in the cosmos and during its dissolution, when in yoga slumber Viṣṇu reclines on *Śeṣa*, the serpent whose name means “remainder,” floating on the waters of the cosmic ocean. In South India each of the three types of images occupies its own innermost sanctuary, on three levels in three-storied temples. According to the needs of the worshiper, each of these three types of images fulfills four goals: total identification with the god, desire for wish fulfillment in worldly matters, desire for power, and desire for success by magic. According to their desired efficacy on these four levels, the images are more or less elaborate in the number of attendant divinities, with the images granting wish fulfillment on the worldly plane the most elaborate.

The twenty-four varieties of the four-armed, standing Viṣṇu image are emanations (*vyūhas*) of the supreme Viṣṇu. Four of the emanations, *Samkarṣaṇa*, *Vāsudeva*, *Pradyuma*, and *Aniruddha*, are considered primary, though their names occur as the thirteenth, fourteenth, fifteenth, and sixteenth in the list of twenty-four.

Theological doctrine and its supporting imagery each follow an inherent logic. The *vyūha* or emanation doctrine is as relevant to the twenty-four types of the Viṣṇu image as the *avatāra* or incarnation doctrine, according to which the supreme Viṣṇu was fully embodied in a specific shape, be it that of fish or boar or man or god. One or the other of these incarnate forms, however, including that of the dwarf (*Vāmana*) or of *Kṛṣṇa*, also figures among the twenty-four varieties of the main cult image of Viṣṇu.

Viṣṇu is also conceived in his fivefold aspect: as ultimate, transcendental reality (*para*); in his emanation (*vyūha*); in his incarnation (*vibhava*); as innermost within man (*antaryāmin*), the inner controller; and as *arcā* or consecrated image, this fifth instance being an *avatāra*, a “descent” into matter.

Each *avatāra* is assumed by the supreme Viṣṇu for a particular end, as the situation demands. Yet each *avatāra* or divine descent, though known to have come about at a definite time, remains valid for all times. The number of *avatāras* or incarnations (*vibhavas*) is generally accepted as ten, but twelve further *vibhavs* are also described. The ten shapes are those of the (1) fish (*Matsya*); (2) tortoise (*Kūrma*); (3) boar (*Varāha*); (4) man-lion (*Narasimha*); (5) dwarf and “[god who took] three strides” (*Vāmana* and *Trivikrama*); (6) *Rāma* with the ax (*Paraśurāma*), who reestablished the leading position of the brahmins; (7) *Rāma*, the ideal king; (8) *Kṛṣṇa*; (9) *Buddha*; and (10) *Kalkin*, the redeemer yet to come. In niches of the temple wall, the *avatāras* are imaged in anthropomorphic, theriomorphic, or combined anthropo-theriomorphic shapes.

The *Matsya avatāra* incorporates a deluge myth, telling how a grateful small fish saved by *Manu* in turn saved *Manu*, who became the founder of present-day mankind. The tortoise myth tells of the cosmic tortoise that lent its body as the firm support for the world mountain, which served as a churning stick at the churning of the primeval ocean. The third of Viṣṇu's descents similarly illustrates a creation myth out of the cosmic waters. While the *Matsya avatāra* establishes the existence of mankind on earth and the *Kūrma avatāra* guarantees the firmness of its support, the boar incarnation shows Viṣṇu as the savior who lifted the earth from the depth of the ocean waters to the light of the sun. In the man-lion incarnation, Viṣṇu assumes this combined shape, bursting out of a pillar in the demon king's palace in order to disembowel this fiend who had questioned Viṣṇu's omnipresence. The fifth incarnation, the dwarf, gained from the demon king *Bali* a foothold on which to stand and took the three-fold stride by which he traversed the cosmos. The four following *avatāras* appeared in the shape of man as hero or god. The images of *Kṛṣṇa* as the child of superhuman powers (*Balakṛṣṇa*) and as flute-playing young god have their own visual iconography, particularly in metalwork. Two forms of *Kṛṣṇa* are unlike other images of Hindu gods. The one is *Jagannātha*, “lord of the world,” whose center of worship is in *Purī*, *Orissa*; the other is *Śrī Nāthjī*, whose center of worship is *Nāthadvāra* in *Mewar*, *Rajasthan*. Both these images are roughly hewn and painted wooden chunks only remotely anthropomorphic. From the sixteenth century on, *Kṛṣṇa* appears in miniature paintings incomparably more frequently than any other Hindu god. In front of Viṣṇu temples, the image in the round of Viṣṇu's partly anthropomorphic vehicle, the bird *Garuḍa*, is supported by a high pillar.

DEVĪ. The Great Goddess, *Devī*, represents the creative principle worshiped as female. She is *Śakti*, the all-pervading energy, the power to be, the power of causation, cognition, will, and experience. She is the power of all the gods; she wields all their weapons in her main manifestations or images. She is the origin of the world, the conscious plan of creation, the mother; she is the goddess Knowledge. Her main image is that of *Durgā* in the act of beheading the buffalo demon, the mightiest of the demons whom she defeats. This

huge, dark, demonic animal, an embodiment of stupidity, is her archenemy. In her image as killer of the buffalo demon, the young and lovely goddess is accompanied by her mount, the lion.

In certain traditions the buffalo demon while still in human shape adored the goddess. In some of the sculptures of the goddess as slayer of the demon—his body that of a man, his head that of a buffalo—he ecstatically surrenders to her as she slays him. When not depicted in action but standing straight in hieratic stance, the goddess is supported by a lotus or a buffalo head.

The Great Goddess has many forms. Like Śiva she has three eyes; like Viṣṇu, in her form as Yoganidrā, “yoga slumber,” she is represented lying, an embodiment of Viṣṇu’s slumber. Yoganidrā is most beautiful and has only two arms, whereas the Goddess displays from four to sixteen arms in her other images. Although the lion is the *vāhana* or vehicle of the Great Goddess, as Rambhā she rides an elephant; as Gaurī, the White Goddess—the aspect under which the gods contemplate her—she stands on an alligator. In her horrific, emaciated aspects, the owl is her vehicle. Like Śiva, the Goddess is seen in divine beauty or in a shape of horror as Kālī or Cāmundā.

When worshiped in her own image, the Goddess is the center of the composition, but as the *śakti* or creative power of a god she is figured by his side, smaller in stature, and with only two arms, for she is the god’s consort. Pārvatī is Śiva’s consort, whereas Bhūdevī and Śrīdevī—the goddess Earth (Bhū) whom Viṣṇu rescued in his boar incarnation, and the goddess Splendor (Śrī)—are shown by Viṣṇu’s side.

If the images of these gods are cast in bronze, they are modeled in the round. These are processional images, meant to be visible from all sides, in contrast to the stone images in the innermost sanctuary or on the temple walls, where they confront the devotee as he or she approaches them. However, where the image of Devī is represented as the supreme goddess, she may be flanked or surrounded by smaller figures of gods and demons who play a role in the particular myth represented. Attendant divinities may further enrich the scene.

Devī is not only represented in her own right as supreme goddess or as the consort of one of the main gods, she is also embodied as a group, particularly that of the “Seven Mothers” (*saptamātṛkās*) where, as Mother Goddess, she is shown as the *śakti* of seven gods, including Brahmā, Viṣṇu, and Śiva. Brahmā, although the creator in ancient times, is rarely figured in the present-day Hindu pantheon and has but few temples of his own. In South India his image figures on the south wall of a Viṣṇu temple opposite that of Śiva Dakṣiṇāmūrti on the north wall.

Brahmā’s consort Sarasvatī, the goddess of knowledge and speech, is worshiped in her own image to this day. The image of the “Seven Mothers” arrayed in one row are worshiped in their own sanctuary. Another assemblage of “group

goddesses,” though of lower hierarchical standing, is worshiped in hypaethral temples, which allow their total of sixty-four images to be worshiped separately. The iconography of the Goddess has its counterpoint in the (originally imageless) diagrams. Both these instruments of contemplation of the goddess—her image and the geometrical diagram—are man-made. The Goddess is also worshiped as a stone in its natural shape.

Stones in themselves are sacred. A *śālagrāma* stone, a fossilized ammonite embedded in dark stone, represents Viṣṇu, with the spiral of the fossil structure evoking Viṣṇu’s wheel. The *śālagrāma* is worshiped in domestic rituals. Similarly another stone, the *bāṇalinga*, washed by the water of the river where it is found into *liṅga* shape, is sacred to Śiva. Among *liṅgas*, which can be made of any material, whether clay or precious stone, the *svayambhū liṅga*, a natural outcrop of rock like a menhir, has special sanctity.

Today most of the preserved images are made of stone or metal. The few paintings that have survived over the last four centuries are in watercolor on paper, as a rule small in size, and narrative rather than iconic. To this day the gods are painted in their iconographic identity on walls of houses and on portable paper scrolls. Color, according to ancient texts, was essential to the image: its use was primarily symbolic and expressive of the nature of the respective deities. However, different colors in different texts are prescribed for the same deity.

GAṆEŚA. Gaṇapati or Gaṇeśa, the lord of hosts and god of wisdom, who is also called Vighneśvara (“the lord presiding over obstacles”), has an obese human body topped by the head of an elephant. Worshiped throughout Hinduism, he is invoked at the beginning of any enterprise, for his is the power to remove obstacles but also to place them in the way of success. His shape is a symbol charged with meaning on many levels. His huge belly, containing the world, is surmounted by his elephant head, signifying the world beyond, the metaphysical reality. The head is maimed; it has only one tusk, thus signifying the power of the number one, whence all numbers have their beginning. Every part of Gaṇeśa’s shape is a conglomerate symbol, and each is accounted for by more than one myth. According to one tradition, the dichotomy of Gaṇeśa’s body resulted from Śiva’s beheading of Vighneśvara, Pārvatī’s son, in a fit of anger. Śiva then ordered the gods to replace Vighneśvara’s head with that of the first living being they met. This was an elephant; they cut off its head and put it on Vighneśvara’s body. According to another source, Gaṇeśa was the child Kṛṣṇa whose head was severed by Śani (Saturn) and replaced by that of the son of Airāvata, elephant of the god Indra.

In the *R̥gveda* (2.23.1) Gaṇapati is a name of Bṛhaspati, the lord of prayer, the lord of hosts. From the fifth century CE, images of Gaṇeśa are numerous. An elephant-headed deity is shown on an Indo-Greek coin of the mid-first century CE. Today, Gaṇeśa is invoked at the beginning of all literary compositions and all undertakings. Every village, every

house has an image of Gaṇeśa, seated, standing, or dancing—like Śiva. Some of his images have a third eye. In one of his (generally) four hands he holds the broken-off tusk. His vehicle is the mouse or the lion. In his form as Heramba, Gaṇapati has five heads; as Ucchiṣṭa Gaṇeśa, he is accompanied by a young goddess. He is red, yellow, or white in different varieties of his image.

ICONOGRAPHY: BUDDHIST ICONOGRAPHY

In Buddhism, the very nature of a sculptural image is complex. Not only have the conception and function of images

varied over the course of Buddhist history, but also according to the particular ritual, devotional, and decorative context in which they are situated. Although there has been considerable scholarly debate about the matter, it seems clear that Buddhists began to depict the Buddha very early on, perhaps even before he died, although no such images survive. The Buddha himself is recorded in some commentaries on the Pali *suttas* to have said that images of him would be permissible only if they were not worshiped; rather, such images should provide an opportunity for reflection and meditation. However, in other commentarial texts images also are discussed as viable substitutes for the absent Buddha. In any case, virtually all Buddhist temples and monasteries throughout the world contain sculptural images—of the Buddha, *bodhisattvas*, minor divinities, *yakṣas*, and significant monks and saints. These images range from very simple early Indian stone sculptures of the Buddha, standing alone delivering a *dharma* talk, to incredibly intricate medieval Japanese depictions of a *bodhisattva* like Kannon with a thousand heads, elaborate hand gestures, and iconographic details.

IMAGES OF ŚĀKYAMUNI (THE “HISTORICAL BUDDHA”).

The earliest surviving Buddhist sculpture dates to roughly the third century BCE, and the images that were produced contextually functioned as decorations and visual “texts” in monasteries. Significantly, however, the Buddha himself is absent from these very early images. Instead of his physical form, early Buddhist artisans employed a range of visual symbols to communicate aspects of the Buddha’s teachings and life story:

1. The wheel of *dharma*, denoting the preaching or “turning” of his first sermon, and also, with its eight spokes, the eight-fold Buddhist path.
2. The bodhi tree, which represents the place of his enlightenment (under the tree) and comes to symbolize the enlightenment experience itself.
3. The throne, symbolizing his status as “ruler” of the religious realm, and through its emptiness, his passage into final *nirvāṇa*.
4. The deer, evoking both the place of his first sermon, the Deer Park at Sārnāth, and also the protective qualities of the *dharma*.
5. The footprint, which denotes both his former physical presence on earth and his temporal absence.
6. The lotus, symbolic of the individual’s journey up through the “mud” of existence to bloom, with the aid of the *dharma*, into pure enlightenment.
7. The stupa, the reliquary in which the Buddha’s physical remains are contained—a powerful symbol of both his physical death and continued presence in the world.

Later Buddhism added countless other symbols to this iconographic repertoire. In the Mahāyāna, for instance, the sword becomes a common symbol of the incisive nature of the Buddha’s teachings. In the Vajrayāna, the *vajra*, or diamond (or

thunderbolt), is a ubiquitous symbol of the pure and unchanging nature of the *dharmā*.

Much of the very early art produced in India is narrative in both form and function, presenting episodes from the Buddha's life and, particularly, scenes from his prior lives. At sites such as Bhārhut and Sāñcī in modern Madhya Pradesh, Bodh Gayā in modern Bihar, and Amarāvātī in modern Andhra Pradesh, huge stupas were erected as part of the large monastic complexes that were built in these locations beginning in the third century BCE. In addition, elaborate carvings were made on and around these stupas, particularly on the railings that encircled the monuments themselves. Many of these were scenes from the Buddha's prior lives, which also were verbally recorded in the *Jātaka* and *Avadāna* literature. These included representations of prior Buddhas, as well as depictions of key events in the Buddha's life such as miraculous conception, his birth, and his departure from the palace in search of enlightenment.

Typically, it has been assumed that because the earliest Buddhist artistic images did not depict the Buddha, there must have been a doctrinally-based prohibition against such depictions. First articulated by the French art historian Alfred Foucher in 1917, this idea—generally referred to as the “aniconic thesis”—has deeply influenced our understanding of early Buddhist art. The basic assumption has been that there must have been a prohibition against representing the Buddha in the early centuries after his death. Perhaps this was because the Buddha had, at the time of his *parinirvāṇa*, passed forever out of existence, and therefore could only be represented by his absence.

In the late twentieth century scholars began to rethink this basic assumption, arguing that perhaps these early sculptures are not reflective of a theological position, but instead frequently represent scenes after the Buddha's death, scenes of worship at prominent places of pilgrimage linked to key events in his life—such as Bodh Gayā, Lumbinī, and Rājagaha—and are thus intended to serve as ritual records and blueprints, and visual prompts for correct veneration. In any case, what seems clear is that early Buddhists had a complex understanding of both the form and function of the Buddha's representations, and that any attempt to articulate a univocal theory of early Buddhist art is probably misguided, precisely because of the complex interactions of original intent, ritual and aesthetic context, and individual disposition. Fundamentally, then, Buddhist images project an open potential.

Actual images of the historical Buddha began to appear sometime around the turn of the first millennium, prominently in two regions: in Mathura, near modern Agra, and in Gandhara, in what is now modern Afghanistan. In Mathura, large standing images of the Buddha were made in red sandstone. The Buddha in these images is depicted as broad shouldered, wearing a robe, and marked by various *lakṣaṇas*, the thirty-two auspicious marks with which he was born. Described in several early texts, these included the *uṣṇīṣa*, or

protuberance atop the head, elongated earlobes, webbed fingers, and *dharmacakra* on the palms. In the Gandhara region, the Buddha typically was depicted in what appears to be a Greek style of representation, wearing a robe that resembles a toga, and with distinctly Western facial features. These details may be evidence that an iconographic exchange took place with the Greeks who inhabited the region at the time of Alexander the Great. Many of the Gandharan Buddha images depict him seated, forming the *dharmacakra mudrā*—literally the “turning of the wheel of *dharmā* gesture”—with his hands. In other images he is presented in a meditative posture, his body withered by the years of extreme asceticism that preceded his enlightenment. These different iconic forms were employed by Buddhist artisans (and their royal, monastic, and lay patrons) to emphasize different moments in the Buddha's life story, and to convey visually different aspects of the *dharmā*.

By the fifth century CE, the Buddha was represented in a large array of forms and sizes. Some of these representations were truly colossal, cut from cliffs and reaching upward of 100 feet—a practice that would continue throughout the Buddhist world for the next millennium. The sheer size of these images seems to have been intended to convey an understanding of the superhuman qualities of the Buddha, many of which were also expressed in contemporary biographical stories contained in various Nikāyas, the *Lalitavistara*, *Buddhacarita*, and several other well-known texts. Furthermore, such massive images would have served as a potent means of attracting new followers.

Stone and metal sculptures of the Buddha were produced in abundance throughout India. These were in addition to painted images, many of which were in caves, such as those that form the massive monastic complexes at Ajantā and Ellora. Many of these images presented the Buddha in a single pose, representing a particularly significant moment in his life. Among these, the giving of his first sermon was especially common. The Buddha typically is seated in such images, forming the *dharmacakra mudrā*. Oftentimes, he is flanked by several smaller figures: the five monks who first heard the sermon, the laywoman Sujatā who offered him the modest gift of food that gave him strength to attain enlightenment, two deer, and an image of the wheel.

Another common form is the Buddha at the moment of defeating the evil Māra—the embodiment of temptation, illusion, and death in Buddhism. In these images, the Buddha is seated in what is sometimes called the *bhūmisparśa mudrā*, or “earth-touching gesture,” visually evoking the moment when the Buddha calls the earth goddess as witness to his enlightenment, and marking the final defeat of Māra. This iconographic form, sometimes presenting the Buddha as a crowned figure and including the seven jewels (*saptaratna*) of the ideal king, became extremely popular in medieval north India, where it seems to have been complexly involved in royal support of Buddhism by the Pālas, the last line of Buddhist kings in India, evoking as it does the image of the *Dharmarāja*, the righteous ruler.

By the eighth century, a fairly common means of representing the Buddha—especially in the monastic stronghold of northeastern India—was a standardized set of eight scenes known as the *aṣṭamahapratibhāya*. This presented a kind of condensed version of the Buddha's life—birth, enlightenment, first sermon, various miraculous events in his biography, and death—that enabled the viewer of the image to participate ritually and imaginatively in the entire life of the Buddha by looking at and venerating a single image. In this sense, then, such images were more than visual texts or narratives; they served as means to embark upon visual pilgrimages. As such, they not only recorded past events in the Buddha's life and ongoing ritual activity, but also allowed the viewer to participate in the Buddha's life. In short, they evoke a sense of the Buddha's continued presence in the world despite his physical absence.

BODHISATTVAS. As the various Mahāyāna schools emerged and developed in India, Tibet, and later in East Asia, the Buddhist pantheon expanded tremendously and was reflected in both art and iconography. In India, particularly in the northeast, there was a virtual iconographic explosion after the eighth century. Although images of various *bodhisattvas* had been produced in the early art of Gandhara and Mathura, they became particularly prominent in the Mahāyāna. Images of Mañjuśrī were quite common in India after about the fifth century, and he is sculpturally depicted in dozens of forms. Typically, he is depicted as a handsome young man holding aloft a sword—the incisive sword of wisdom, with which he cuts through delusion and ignorance—in one hand and a lotus in the other. A consistent element in his iconography is the representation of the book—sometimes he holds the text aloft, sometimes it rises out of a lotus to one of his sides. In contemporary iconographic manuals, this is described as the *Perfection of Wisdom* text, of which he is the manifestation. In the Vajrayāna context, Mañjuśrī frequently is depicted in a wrathful form, as Yāmantaka, a buffalo-headed demon who does battle with Yāma, the god of death. Avalokiteśvara, the embodiment of compassion and the bodhisattva who sees all suffering and comes to the aid of his devotees, is perhaps the single most popular figure in the Buddhist world after the Buddha himself. He is depicted in a vast range of forms. Avalokiteśvara frequently is shown with several eyes, denoting his compassionate omniscience, and sometimes with multiple heads, as in the *daśamukha* (ten-faced) iconographic form prevalent particularly in Nepal.

In addition, Avalokiteśvara almost always has multiple hands, in which he holds various implements that aid him in his salvific endeavors. In the *Saddharmapuṇḍarīka Sūtra* and several other Mahāyāna texts, he is described as a great protector whom one invokes against a standardized set of perils (snakes, beasts, robbers, poisons, storms, and so forth), which are sometimes iconographically depicted with him. Avalokiteśvara becomes extremely popular in East Asia, where he is known as Kannon (in Japan) and Kuan-yin (in China); as Kannon, he sometimes is depicted with 1,000

heads, and as Kuan-yin he is manifested as a female figure. Maitreya, the Buddha of the future, is often depicted as a crowned, royal figure (often with a Buddha image or stupa in his forehead). He typically displays the *dharmacakra mudrā*, the gesture of religious discourse, since it is he who will deliver the final version of the *dharma* that will release all beings from *samsāra*. In medieval China, after the Tang period, Maitreya is sometimes iconographically transformed into Budai, a jovial, pot-bellied figure who spreads good cheer and is the special friend of children.

TRANSCENDENT BUDDHAS. The various Mahāyāna schools articulated complex understandings of the continued presence and power of the Buddha in the world, understood broadly as *buddhatā*, or “buddhaness.” One particularly common manifestation of *buddhatā* was the five celestial Buddhas, sometimes called Jina or Dhyāni Buddhas. More properly deemed the *pancatathāgātas*, this set represents the manifestation of different aspects of the Buddha's teaching and salvific power, and is depicted in both sculpture and painting (particularly *maṇḍala* paintings in the Vajrayāna). The five celestial Buddhas are Vairocana, Akṣobhya, Ratnasambhava, Amitābha, and Amoghasiddhi.

Iconographically, each of five Buddhas bears specific symbols and a specific color (when painted in a *maṇḍala*, for example), as well as specific *mudrās*. For instance, Akṣobhya (the “unshakable one”) occupies the eastern quadrant of the *maṇḍala* and displays the *bhūmiśparśa mudrā*, since he is the manifestation of the Buddha's steadfastness and unshakable calm, even in the face of Māra, or the embodiment of death. Vairocana, the “radiant one,” is the manifestation of the Buddha's supreme *dharma*, and thus his standard iconographic form displays the *dharmacakra mudrā*. In the Pure Land schools that developed in China and later took root in Korea and Japan, Amitābha, the Buddha of the West, became particularly important. In a wide variety of images—stone and metal sculptures, bas-reliefs, cave temples, and paintings—Amitābha frequently is depicted at the center of a large entourage of *bodhisattvas* and buddhas, or more commonly is presented in a standard triad, flanked by Avalokiteśvara and Maitreya. As Amida, Amitābha continues to be very popular in contemporary Japan, and is depicted in a variety of modern images including metal and plastic sculptural forms, paintings, and even animated comic books.

WRATHFUL FIGURES. With the rise of the Vajrayāna in northeastern India around the ninth century, and its later development in Tibet, the divine pantheon expanded to a seemingly limitless degree, with a vast range of Buddha families, *bodhisattvas*, goddesses, *yoginīs*, and all manner of fierce divinities. There are numerous categories of wrathful beings in the Vajrayāna pantheon, including *vajradhāras*, *herukas*, *lokapālas*, and *dharmapālas*. These beings are projections of the base aspects of human nature: lust, anger, delusion, greed, and so on. However, when propitiated these figures are transformed into saviors who destroy the passions of the mind and protect the faithful. Their faces are depicted with

strikingly wrathful expressions, their mouths contorted into angry smiles, from which protrude long fangs, sometimes dripping with blood.

Particularly in Tibet, *maṇḍalas* frequently depict vastly complex Buddha families and their associated divinities. Meditation and rituals focused on such divinities typically are intended to bring the divinity to life. For instance, in the practice of deity yoga the meditator can bring the divinity to life in him or herself by realizing the inseparability of the self and the divinity. In the esoteric schools that developed in Japan, the *lokapālas* often flank a central *bodhisattva* and are depicted as sometimes fierce and menacing dark-skinned foreigners. Consistent with the early literature that lays out Buddhism's basic cosmological view, in a relative sense, such beings are very real and very active in the world. However, in an absolute sense they ultimately are creations of our minds, and therefore, like everything else, are empty. Therefore, the iconographic presentation of these divinities is intended to provide an opportunity for meditation on the very nature of reality.

WISDOM GODDESSES. A range of divine and semidivine female figures also is depicted in Buddhist iconography, many of which are elaborately described in medieval texts such as the *Sādhanamālā* and *Niṣpannayogāvalī*. The female divinity Tārā emerges in the Mahāyāna as a divine savior who protects and nurtures her devotees. Her name literally means “star,” and she was perhaps originally associated, in particular, with guiding sailors. Tārā is sometimes referred to as *jagat tarinī*, the “deliverer of the world.” She is depicted in numerous forms—sometimes seated with a book, sometimes standing displaying variations of the *abhāya mudrā* (the gesture of no fear) or making a hand gesture of giving—and is intimately associated with the lotus, denoting her characteristic purity. In addition to her very common benevolent forms, in the Vajrayāna Tārā is sometimes depicted as wrathful figure who transforms into the benign savior for her devotees when properly worshiped. Tārā was and continues to be extremely popular throughout the Mahāyāna and Vajrayāna worlds, particularly in Nepal and Tibet, and she is frequently associated with Avalokiteśvara. Sometime around the seventh century, the *Perfection of Wisdom* texts (*Prajñāpāramitā sūtras*) became personified in the figure of *prajñāpāramitā*, wisdom incarnate, the divine “mother” of all enlightened beings. She typically is seated, legs crossed, and has either two or four arms. *Prajñāpāramitā* almost always forms the *dharmacakra mudrā*, holding both a lotus (emblematic of the purity of her teachings) and the text of which she is the embodiment.

SAINTS, ARHATS, AND MONKS. As Buddhism spread beyond India, an elaborate iconographic lexicon related to arhats, monks, and saints emerged. In China, the veneration and representation of important patriarchs became prominent; arhats were frequently represented, occasionally individually but more commonly in groups. In the Chan schools in particular, where monastic lineage was central, portraits of im-

portant patriarchs were common. Most prominent was Bodhidharma, who typically is depicted as an aged monk deep in meditation. Sometimes, he is depicted floating in the ocean atop a reed, representing his voyage from India to China. Bodhidharma also is represented in a kind of aniconic form, as an abstract face painted on papier-mâché or wooden balls, and occasionally as a lascivious old man, often in the company of courtesans. This conveys Chan's understanding that enlightenment can be found in the most mundane, and even the most conventionally polluting, of activities. In Tibet, images of Padmasambhava, who is said to have introduced Buddhism and tamed the demons who inhabited the region, are common. He frequently is depicted as a robed monk with a crown, often holding an alms bowl and *vajra*. Prominent monks such as Atīśa and Xuanzang are common in both the sculpture and painting of China and Japan. Particularly in Japan, individual monks, often specific to a particular monastery, are presented in remarkably realistic images, sometimes life-size, three-dimensional sculptures. As with images of Śākyamuni, such sculptures function as meditational aids to be emulated, pedagogical prompters, and outright objects of devotion.

IMAGES AND RITUAL. The *Sādhanamālā* and *Niṣpannayogāvalī* are two medieval Indian iconographic manuals, written in Sanskrit and still used in the early twenty-first century. These texts—and the countless other lesser-known manuals that deal with three-dimensional icons, paintings, and *maṇḍalas*—describe in sometimes minute detail the proper way to construct an image. They cover the purifying rituals to be performed prior to the start of work, the materials to be used, the iconographic details, the specific proportion, as well as detailed instructions for the ritual practices that are associated with the image.

From the moment they appeared in the Buddhist world, visual images were intended to narrate aspects of the Buddha's life and teachings, and therefore function on the ground as visual texts to be read. In addition, they were very much intended to be objects of ritual worship. A wide range of texts are available for making and consecrating Buddhist images, from locally-produced manuals in the vernacular to pan-Buddhist iconographic manuals. Perhaps the most common form of worship in the Buddhist world is *buddha pūjā*, literally “honoring the Buddha.” This is a ritual that typically involves making some sort of offering to a Buddha image (or to a relic or a stupa), such as a flower, a small lamp, food, or even money. Many images, particularly the stelae that were abundantly produced in the medieval Indian milieu—although this also is an iconographic theme on some of the very earliest Buddhist images—actually depict such worship as part of the sculpture. These depictions usually are found along the base of the image, at what would in a ritual context be eye-level for the worshiper. The iconography in such cases, then, serves as a kind of visual guide to proper ritual action.

Across the Buddhist world, image construction and consecration are embedded in elaborate ritual structures. Im-

ages are made by specially trained and sanctified artisans, who follow extremely precise iconographic guidelines that dictate the proportions and specific details of a particular image. In northern Thailand, for instance, images are constructed using local ritual texts that include iconographic proportions, recitation of special protective chants (*paritta*), and elaborate consecration rituals, which “enliven” the image. Of particular interest in this regard is a clearly articulated correlation between the various parts of the image—which in the ritual becomes the “form body” (*rupakāya*) of the Buddha—and the *dhammakāya*, or “teaching body” of the Buddha. According to these Thai texts—and there are similar manuals in other ritual contexts in Tibet, China, Japan, Sri Lanka, and other Asian countries—a properly constructed and consecrated Buddha image is one that makes the ritual participant feel as though he or she is in the presence of the Buddha himself.

For the laypeople and monks who participate in such rituals, the Buddha image has a special apotropaic power, often heightened by the accompanying recitation of *paritta* texts and various *mantras*. In some instances, part of the consecration ritual involves the “instructing” of the image in the life story and teachings of the Buddha, which provides, also, the opportunity for the laity to receive this same instruction. Finally, the construction, consecration, and ritual veneration of images in virtually all Buddhist contexts provide an opportunity for laypersons to generate merit by way of donations made to the image—food, money, material objects—and by sponsoring such rituals.

Frequently, Buddhist iconography is intended to focus the mind of the worshiper on the Buddha and his teachings, serving as a visual aid and helping the practitioner to engage in *buddha anusmṛti*, or “recollection of the Buddha.” This important form of meditation involves contemplating the Buddha’s magnificent qualities and internalizing them, very often with the use of a sculpture or painting. The iconography of such images, then, serves a mimetic function in that the meditator is to emulate the iconographically presented Buddha. In the process, the practitioner creates a mental image by internalizing the external iconographic form, thereby becoming like the image, and like the Buddha himself.

JACOB N. KINNARD (2005)

ICONOGRAPHY: DAOIST ICONOGRAPHY

Like Daoism, Daoist iconography is not easily described as a unity. The focus in this entry will be on the visual expressions of the organized religion whose origins can be traced to the second century CE, but this religion and its iconography cannot be understood without reference to the intellectual and religious developments that formed its background.

BACKGROUND. Many of the tenets that the Daoist religion came to embrace evolved during the last four centuries BCE, the period that forged the worldview of imperial China. A chief concern for the competing rulers of the late Warring States period (403–221 BCE) and the founders of the succeeding Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties was the sanction of political power, based on the previous conception of a mandate (*ming*, also meaning “destiny” and “life”) bestowed by heaven (*tian*) on one who possessed perfect virtue or “inner power” (*De*). From the fourth century BCE on, Chinese thinkers speculated about the relationships between this inner power, the concept of an ineffa-

ble way (Dao) underlying the functions of the cosmos as a whole, and the notion of *ming* in its double sense as heaven's mandate to rule and as the mandate of life granted by heaven to each individual. To many of these philosophers, *de* or inner power, believed to derive from the ability of aligning oneself with the Dao, was the prerequisite quality of both the sage ruler and the saint capable of preserving his life. In the *Dao de jing* (Scripture on the way and inner power), attributed to the paradigmatic figure of the "Old Master," Laozi, the saint and sage ruler are equivalent. This also holds for the texts *Guanzi* (compiled between the fourth and the second centuries BCE) and *Huainanzi* (submitted to the Han emperor Wu in 139 BCE). The book *Zhuangzi* (the earliest parts are attributed to the fourth-century BCE philosopher Zhuang Zhou), however, envisages the ideal, "fully realized person" (*zhenren*)—whether female or male—gaining boundless freedom by forsaking all political aspirations.

While some Warring States rulers quickly caught on to the idea of a direct connection between heaven-endowed power and longevity or immortality, a dialogue between various court professionals (astrologers, calendarologists, and health specialists) and philosophers led to the systematization of a theoretical framework by which the cosmic functions of the great Dao could at least approximately be understood and controlled. Modern Western scholars have termed the resulting system—based on the theories of yin and yang, of *qi* (the vital pneuma and material basis of the universe), and of the five cosmic driving forces (*wuxing*; also rendered five elements, phases, or agents)—*Chinese correlative cosmology*. Its symbolic expressions included animal figures (e.g., the tiger and the dragon standing for yin and yang), color schemes, and trigrams derived from the ancient *Yi jing* (Book of changes). The system, which united the divine, natural, social, and moral orders into one interconnected whole, henceforth became the mainstay not only of traditional Chinese cosmo-political thought, but also of the gamut of Chinese sciences, including medicine and the immortality arts, and of Chinese religion in general.

Just as, according to correlative cosmology, the order of the cosmos was manifest in the human realm in the form of administrative structures, the universe as a whole came to be viewed as administered by a bureaucracy of divine forces. The figure of the Yellow Emperor took the central position, analogous to the elemental force of "yellow" earth, among a group of five celestial thearchs correlated with the *wuxing*. By the early Han dynasty, the Yellow Emperor was the paradigm for the sage ruler. Believed to have not only civilized the world, but also succeeded in the cultivation of life, he became the model for Emperor Wu's (r. 140–87 BCE) quest for universal rule and immortality. But some two hundred years later, the emperors of the declining Han dynasty pleaded their hopes for longevity, male posterity, and the dynasty's survival before a far more powerful divinity: Laozi, who by then was seen as the very embodiment of the eternal Dao itself.

Demonstrative of the experience that for ordinary humans immortality is attainable only in an afterlife, most artifacts testifying to ancient Chinese beliefs about the cultivation of life have been discovered in tombs. A second-century BCE Han tomb in Mawangdui contained the almost perfectly preserved body of a woman belonging to the high aristocracy. A painted silk banner presenting the lady's ascent from the tomb to the immortal realms covered the innermost of four coffins encasing her. Other finds in tombs of Han dynasty elites include Boshan (Universal Mountain) censers, incense burners with perforated, mountain-shaped lids depicting the marvelous world of the immortals; bronze mirrors, whose backsides show the Queen Mother of the West, often along with her male counterpart, the King Father of the East; and so-called money-trees, stylized tree-sculptures in bronze with coin-shaped leaves, their branches carrying divinities such as the Queen Mother of the West, immortals, and fabulous beasts.

The Queen Mother, a deity of ancient origin, became one of the foremost idols of the Han immortality cult. By the second century CE, she was believed to rule over a paradise of immortals on the mythic Kunlun Mountain located at the far western rim of the Han empire. Her picture—identified by her phoenix-patterned headdress, her throne flanked by a tiger and dragon, and animals such as a bird, hare, toad, and fox—frequently adorns Han dynasty stone sarcophagi and mortuary architecture. As Wu Hung has demonstrated, her increasingly iconic representation—showing her frontally, seated, and centered—derives from images of the Buddha, which became known in China around the same time. Indeed, in the second century CE, the Buddha (recognizable by the *uṣṇīṣa* protuberance on his head, his halo, Ghandaran-style gown, and hand gestures or *mudrās*) began to appear in Chinese funerary art as an equivalent of the Queen Mother of the West, promising, like her, immortality beyond the tomb.

Evidently, the hope for postmortem immortality in some paradisiacal region was counterpoised by fears of an afterlife in the drab realms of death. Texts excavated from graves of commoners reveal that the netherworld was already in the late fourth century BCE imagined as a bureaucratic institution. By the second century CE, this administration was believed to be headquartered in China's Five Sacred Mountains and ruled by the Celestial Emperor or Yellow God. The texts usually express people's trepidation at the possibility of untimely death, either on account of an error in the netherworld bookkeeping, or because the deceased might have suffered or committed severe wrongs during life. Surviving family members buried human figurines of ginseng and lead with the bodies of the deceased to redeem their guilt and serve as surrogates for the living, lest they might fall ill and die by implication.

EARLY DAOIST RELIGION. Early Daoists shared and refined this broader worldview as they constructed their tradition between the second and fifth centuries CE. Among several polit-

ico-religious movements in the second century, the Way of the Celestial Master alone survived and established the fundamental liturgical and organizational structures of the Daoist religion. Celestial Master followers worshiped Laozi as the supreme embodiment of the Dao, whose limitless pneumata (*qi*) could, however, take the shape of innumerable other divinities. Originally more concerned about death and its harbingers, disease, than the pursuit of immortality, Celestial Master priests sent petitions to the Three Bureaus, the other world's legal institution, to relieve parishioners from the consequences of the crimes of deceased family members. Subordinated to the Three Bureaus were twelve hundred officials, including their civil and military staffs, whose divine intervention could be invited depending on the specific circumstances of each case.

These were fairly concrete notions about a bureaucratically functioning spirit world, wholly inscribed in Laozi's divine body of the Dao, but, in accord with the *Dao de jing's* assertion that the Dao ultimately has no concrete forms, early Daoists hesitated to give outside visual form to any of these ideas. A second-century commentary to that scripture, whose author stood at least close to the Celestial Master religion, even warns against picturing the Dao in the form of innercorporeal divinities. This evidently marked an extreme, since anthropomorphic visualizations of the numinous forces indwelling the body—a microcosm of Laozi's cosmic body—quickly became central to the Daoist work of regulating universal flows through meditation. The fourth-century Shangqing (Higher Purity) scriptures contain the most detailed instructions for such visualizations, although there are prior guidelines for actualizing microcosmic deities—even Laozi himself—through mentally created images of their appearances, including their size, garb, headgear, coloring, and accoutrements.

Apart from this eidetic technique of imaging, however, Daoists presented the forces of the divine preferably in abstract, symbolic ways. Diagrams, sacred maps, and various forms of secret script early on played important roles. The yin-yang symbol (*taiji tu*) with its two comma-shaped fields inscribed in a circle, which became so prominent from the Song dynasty (960–1279) on, may not just be traced to a Tang dynasty (618–907) Buddhist antecedent, as Isabelle Robinet has shown, but to even earlier Daoist, albeit non-transmitted, diagrams. Maps of the interior of the Five Sacred Mountains existed already in early medieval times, even though the extant diagrams only replace the long-lost originals. But the chief key to access divine forces was writing. This accounts for the centrality of Daoist *fu*, secret tallies (or talismans), which Daoists drew in order to tap particular numinous sources. Moreover, from the fourth and fifth centuries on, Daoist scriptures were held to incorporate the blueprint of the cosmos itself in their original celestial-script versions. That is why so much weight was put even on the calligraphic quality of the transcripts of such scriptures in human hands.

DAOIST SCULPTURE. Concrete material images, however, constituted in Daoist eyes only crude attempts to give fixed shape to the ever-changing modalities of the Dao and its hypostases. Fully sculpted icons of durable materials presented the bottom rank on that scale, and were considered dangerous, because their coarse materiality might easily invite impure and potentially malevolent spirits instead of the deities whose likeness they purportedly produced. Even in late imperial times, Daoist texts frequently mention demons possessing such icons as causes of disease, but already a fifth-century source, attributed to the famous southern Chinese Daoist Lu Xiuqing (406–477), complains that lay believers installed sculpted images in their ritual chambers like the followers of vulgar cults. Curiously, despite all Daoist claims of the formlessness of the Dao, a seventh-century Buddhist author accuses precisely Lu Xiuqing of plagiarizing Buddhist icons in sculptures of Daoist Heavenly Worthies (an epithet of the Dao's embodiment as supreme deity in three different aeons).

Archaeologically, the earliest examples of Daoist sculpture date indeed to the fifth and sixth centuries CE; but they come from north China, where the Daoist Kou Qianzhi (d. 488) supposedly first promoted such icons. These images, carved on stelae and dedicated by private donors to the weal of the government and the happiness of their ancestors, ostensibly relate to a well-known Buddhist practice of merit-transfer. Indeed, there are indications that religious differences barely mattered to followers of the custom. Several of the stone monuments combine images of both Buddhist and Daoist divinities, which are distinguished only by minor features. While the figures of buddhas and *bodhisattvas* feature *uṣṇīṣas* or crowns and monastic garb, Daoist deities, often bearded and holding fans, wear hats and belted Chinese garments. Otherwise, the posture and grouping of the Daoist gods, with the chief divinity flanked by two attendants, conform entirely to Buddhist iconography. Nor are there differences in the appearance of Daoist deities identified by distinct titles; whether a figure is referred to as Lord Lao (specifically Laozi as the body of the Dao) or Heavenly Worthy (a general appellation for hypostases of the Dao), their images are the same. Only late in Daoist history, the Three Purities, or main hypostases of the Dao, developed their individualized iconographies with Yuanshi tianzun (Heavenly Worthy of Prime Origin) holding a pearl, Lingbao tianzun (Heavenly Worthy of the Numinous Treasure) carrying a scepter, and Daode tianzun (Heavenly Worthy of Dao and De) retaining the features of the white-haired, bearded Lord Lao (Laozi).

While Six Dynasties (220–589) Daoist sculpture was predominantly a matter of private devotion, the situation changed dramatically under the Tang dynasty, which traced its ancestral line to Laozi and therefore strongly supported Daoism in its official cult. Tang emperors established a nationwide network of Daoist temples in which large freestanding statues of the holy ancestor were set up. Empress Wu (r.

684–705), before she founded her own interim dynasty and turned to Buddhism for legitimization, decreed that sculptures of Laozi's mother should accompany those of Laozi; and Xuanzong (r. 712–756), the most powerful of the emperors of the re-established Tang, even had his own likeness installed in temples along with images of Laozi.

If statuary began to play a role in state-endorsed Daoist temples in connection with the imperial cult, the rules for the production and worship of these images followed Buddhist models. A relatively early Daoist source (ascribed a pre-Tang date by many scholars, but more probably compiled in the early Tang) determines a code of “auspicious marks” (Skt., *lakṣaṇa*) for different types of icons and, prescribing monthly vegetarian offerings and ritual cleansings for them, ascertains their sacrality. In the early tenth-century, a prominent court Daoist welcomed all ideological efforts at demonstrating the miraculous powers of Daoist over Buddhist icons.

Still, Daoists remained reluctant about attributing statuary a central place in their innermost ritual practice. Even today, effigies are generally eschewed in the inner sanctum of the enclosed temporary altar constructions, where the essential rites of Daoist services take place. As a rule, only painted images of the Daoist high divinities are allowed here, while sculpted icons from community temples and household altars are relegated to the outer areas of the sacred space as onlookers. If statues have any immediate ritual functions, such as the figures of altar guardians, messengers, or the newly deceased in funeral services, they are made of paper. These images are animated at the beginning of the ritual through the so-called eye-opening rite (*kaiguang*), and burned as soon as the spirits legitimately possessing them during the ritual have fulfilled their tasks.

DAOIST PAINTING. Court support was also a chief factor in the development of Daoist painting. Wu Daozi (fl. 710–760), reportedly a Daoist priest, created his famous murals and scroll paintings on both Buddhist and Daoist themes under Emperor Xuanzong's sponsorship. None of his originals has survived, but textual references and transmitted works of later artists, most of whom placed themselves in Wu Daozi's tradition, bespeak the main features of his style: movement, dramatic facial expressions, individualized figures, and narrative composition.

Beautiful examples of the illustrative art that the Daoist pictorial tradition eventually produced survive in the fourteenth-century murals of the Eternal Joy Temple (Yongle gong in Shanxi province) depicting the lives of the Immortals (*xian*) Lü Dongbin and Wang Chongyang. But more expressive of what inspired Daoist painting at its core is the brilliant rendition of the theme known as the “Audience with the Origin” in the temple's main hall. The frescoes show the various monarchs of the Daoist universe, including the Jade Emperor; the Purple Tenuity Emperor of the North Pole; the Queen Mother of the West; her spouse, Lord of the Dao in the East; Houtu, the royal matriarch of earth; and their reti-

nues, all turning towards the Dao, which in its threefold aspect was represented by statues of the Three Purities (now lost).

Depictions of the Daoist pantheon at audience with the Dao's higher hypostases may go back to the tenth century. Other examples of narrative religious painting in China, such as the tableaux related to the “Water and Land” ritual of universal salvation (*shuilu zhai*) and the earlier “transformation pictures” (*bianxiang*) of hell (which existed already by the seventh century and of which Wu Daozi reportedly also was a master) are associated with Buddhism; and Buddhism is considered to have inspired Daoist painting in general. But such paintings on Buddhist themes were early on connected with popular performances and rituals in China and likely received indigenous Chinese and Daoist influence from the beginning. Surviving “Water and Land” frescoes, hell frescoes, and scrolls of the thirteenth and fourteenth centuries and beyond, at least, clearly manifest the impact of Daoism (which then had incorporated them in its liturgy) in their hierarchic-bureaucratic vision of the numinous realms and the inclusion of Daoist gods.

Nonetheless, Buddhist iconography unquestionably shaped the appearance of Daoist deities. One example is the Great Monad Heavenly Worthy Saving from Suffering (Taiyi jiuku tianzun), who, already by the tenth century, had assumed features of the *bodhisattvas* Avalokiteśvara (Guanyin), Kṣitigarbha (Dizang), and Mañjuśrī (Wenzhu). Central to Daoist funerary rituals, Taiyi jiuku tianzun is still represented on painted scrolls next to the Three Purities in mortuary altar settings. Particularly influential was the submerged Tantric Buddhist tradition in China. As Daoist liturgical texts of the twelfth through fourteenth centuries show, esoteric Buddhist rituals and popular spirit possession practices greatly enriched the Daoist exorcistic tradition and its pantheon of star deities, thunder gods, and divine marshals or generals. As a result, some Daoist deities, such as the multi-handed Mother of the Seven Dipper Stars (Doumu), became directly modeled on Tantric divinities. In others, the multiple eyes, heads, and arms of Tantric spirits were combined with traditional Daoist symbols and the names and features of popular gods; in the chief thunder gods, iconographic synthesis produced new chimerical shapes. Daoist sources nonetheless understand these composite divinities in quintessentially Daoist terms as manifestations of pure cosmic forces, re-created through the cycling and blending of corporeal *qi* in visual meditations. As in earlier Daoist texts, these visualizations follow exact descriptions of the deities' semblance and attributes and their cosmological significance; only the iconographic vocabulary has become far more diverse. Even the *fu* tallies, originally abstract graphs designed to contract divine powers, take in these late ritual manuals, often the form of calligraphic pictures of the deities and their symbols.

The general agreement between such liturgical sources and depictions of Daoist divinities in late imperial and modern religious paintings suggests a connection between ritual

performance and pictorial representation. Indeed, just as the Audience with the Origin was not merely an iconographic theme, but originally denoted the culmination of Daoist meditation (when the divinities of an adept's or priest's bodily microcosm are brought face to face and merged with the original oneness of the Dao), authentic artworks, and particularly paintings, were to reflect the internal visions of Daoist priests and the iconographic codes thereby established. That this continuity between liturgy and the visual arts always remained an ideal and never led to the iconographic standardization achieved in the Buddhist tradition is partly due to Daoism's internal diversity and comparatively loose organization, partly to difficulties in institutionalizing links between clerical and art traditions, and, of course, also to the disruptions of modern times.

While already in the twelfth and thirteenth centuries, scrolls portraying the Three Purities, the Jade Emperor, the Purple Tenuity Emperor, the Heavenly Worthy Saving from Suffering, and other Daoist high divinities surrounded the inner, most sacred area of Daoist altars, these paintings, surprisingly, were not accorded full sacred status. Even today, the actual seat of Daoist divinities during rituals is in the *shenwei*, small tablets inscribed with their names, not in the paintings. An exception here is the Daoist tradition of the Yao minority, which clearly emphasizes the sacrality of altar paintings through special rites of consecration and deconsecration (once they have outlived their ritual life spans).

DAOIST ICONOGRAPHY IN POPULAR CHINESE ART AND RELIGION. Daoist visions of gods and immortals, as well as demonic beings and their realms, have had a tremendous influence on popular religious iconography. Temple murals and altar hangings evidently played important roles, but Daoists also propagated their views through narrative and performance arts. The most eloquent proof of this exists perhaps in some of the great vernacular novels of the sixteenth through eighteenth centuries that feature the eminently hybrid pantheon of popular Chinese religion, including immortals, Daoist and Buddhist divinities, and entirely composite and often even renegade gods, all under the Jade Emperor's rule. Even contemporary Chinese cite these novels as sources of information about the backgrounds, functions, symbolism, and iconography of the deities worshiped by them, whether in statues and murals in community temples, or in wood-block book illustrations and New Year's pictures at home. As these explanations again are frequently traced to Daoist liturgical literature, they point—in line with the motto favored by late imperial Daoists, that all religious paths eventually run into the Great Way—to Daoism as the most important factor in the formation of popular Chinese religion and iconography.

ICONOGRAPHY: CONFUCIAN ICONOGRAPHY

Over the centuries, the terms "Confucian" and "Confucianism" have been constructed in different ways, both in China and in the West. The adjective "Confucian" here is used loosely, referring not only to the writings of Confucius (551–479 BCE) but also to that larger body of learning and praxis transmitted in other (often older) ancient classical texts and their later commentaries (which are being compiled to this day). This collection of works is very diverse and its boundaries are difficult to determine. The more important titles, which date to Warring States times (403–221 BCE) or earlier, are the *Book of Odes* (*Shijing*), *Book of Documents* (*Shangshu*), *Book of Rites* (*Liji*), *Master Zuo's Commentary on the Spring and Autumn Annals* (*Chunqiu Zuozhuan*), and the *Analects of Confucius*. Somewhat later is the Han dynasty (206 BCE–220 CE) *Book of Filial Piety* (*Xiaoqing*). The term "iconography" is used here in a very general sense to refer to visual depictions of the phenomena recorded in such classical texts, and it also refers to later products of the visual culture that was based in some fashion upon that written legacy.

CONFUCIAN DIVINITIES AND MYTHIC BEINGS. Early texts describe an expansive pantheon of divinities, numinous powers, ideal beings, and culture heroes. These include the Lord on High; heaven and earth; spirits of mountains and rivers; powers of cold, heat, and celestial bodies; mythic supra-human beings; sage rulers; and ancestral spirits, to name a few.

Historiographic issues. The ways in which these beings were visually understood in pre-Han times, however, is unclear. The pre-Han archaeological record preserves depictions of a wide range of mythic beings. However, they are neither readily identifiable nor easily associated with figures from "Confucian" written works.

More specifically, using painted or sculpted figural images as objects of reverence to depict these beings is not clearly attested in early texts. Later Confucian historiography, beginning at least as early as the Song dynasty (960–1279), insisted that anthropomorphic images of deceased human beings, or of nonhuman divinities, were not used in ritual contexts in Warring States times or earlier. Both written records and the archaeological record as it was then known support this notion.

For example, according to the *Book of Rites*, ancestors were instead "imaged" (*xiang*, a term used as both noun and verb) or represented by a personator (or impersonator) of the dead. The personator (*shi*) was a living descendant of the deceased who temporarily took upon the identity of the departed ancestor, whose laid-out body was simultaneously called a *shi*, during commemorative rites that feted the personator/deceased with food and liquor. The consanguineous relationship between the dead and the personator (the bodies of descendants were moreover considered consubstantial with those of their forebears) often ensured a close physical resemblance between the personator and his or her ancestral "prototype."

Personators were not widely used after the Warring States era, but the notion that an image should resemble its prototype became crucial in later times, when validity of an image was determined by its perceived similitude to its prototype. Some Chinese scholars of the Song and Ming (1368–1644 CE) dynasties believed that the custom of using personators to image the deceased was in fact the origin of the later use of anthropomorphic images in sacrificial offerings. According to this historiographic interpretation, after Warring States times the living descendant was replaced with painted or sculpted images of the deceased, which were held to high standards of semblance.

Such ancestral portraits were widely used by the Song dynasty, and were called *ying*, or "shades." Conceptually, the term *ying* incorporates the meanings of both "shadow" and "reflection," and can be understood as an emanated projection from the human body that is visible in sunlight and reflected in mirrors and other clear or flat surfaces, such as the surface of an ancestral painting used in rites to commemorate the deceased. In folk tales such as the Ming dynasty *Peony Pavilion*, shades sometimes become doppelgängers of the original body and take on lives of their own—even after the prototype body is deceased. Ancestral portraits are still widely used in modern times, although they have been largely replaced by photographs, which ensure greater verisimilitude than paintings. In fact, the modern expression "to photograph" is literally *she ying*, "absorb the shade."

Images in early China. Confucian images often emerge from or appear in mortuary, visionary, or other liminal contexts. One of the earliest known textual descriptions of an image in a Confucian text is of an image (*xiang*) created to depict a man seen in a vision. The *Book of History* records how a bereft ruler went into mourning and underwent the

usual austerities of isolation, fasting, silence, and occlusion of the senses. This typically led to visionary experiences, and not unexpectedly the ruler saw in a dream a man whom he understood was to be his helpmate or body-substitute. This helpmate would replace the ruler while he remained secluded in mourning. The ruler ordered an image created of the man he saw and sent it about the kingdom until someone was located who resembled it. This person was then established as the ruler's prime minister. Visions of the deceased, as well as the living, were commonplace in the pre-sacrificial vigils of commemorative offerings presented by pious descendants to their ancestors. It was here that one could see them again, even though they were now in the realm of spirits, which were otherwise formless, invisible, and ineffable.

PHYSICAL APPEARANCE OF CONFUCIAN FIGURES. Virtually nothing is known of the actual physical appearance of particular figures from Confucian lore, or even of Confucius himself.

Han dynasty iconography. By Han times, thinkers and artists began to create their own visual interpretations of important figures. Extant sculpted stone bas-reliefs on shrines, tombs, and steles from the Han and early medieval periods (to 618 CE) depict narrative representations of daily life, historic figures, mythic beings, and prognosticatory omens. These reliefs were didactic in nature and, when located in tombs or shrines, were the backdrop for the mortuary rites convened there.

Confucius appears frequently in these early depictions, never alone and sometimes accompanied by a retinue of disciples and even by half-human, half-animal hybrid creatures. He is yet far from being depicted as the premier sage of the *Analects*—or even as the “uncrowned king” that contemporary philosophical texts claim him to be—but is more commonly shown to be a pedant instructed by recluses, farmers, or even children. He frequently appears in conversation with the legendary Laozi and the child prodigy Xiang Tuo. The assemblage of these three figures constitutes an admixture of mythic accounts from several textual sources, some of which are not “Confucian.” In this grouping, Confucius is understood to be a middle-aged man who is the pupil of both the older master (“Lao” means simply “old” or “elderly”) and the precocious child. Tales of Confucius's apocryphal conversations with Xiang Tuo appear in Dunhuang literature (a trove of documents dating to Tang times discovered in the Dunhuang caves of Central Asia), and both texts and illustrations of the encounter are still commonly included in yearly almanacs distributed among Chinese populations worldwide.

Other bas-reliefs from Han and early medieval times depict culture heroes and heroines from antiquity: the model rulers Yao, Shun, and Yu; exemplars of filial piety; paragons of female courage; and men of remarkable character. The medium does not allow for “realistic” renderings, and the figures are highly stylized and sometimes only identifiable by virtue of their insignia or textual cartouches. Didactic representations, such as those of the Wu clan shrines in Shandong,

depict their subjects in the very act of performing virtuous deeds: a wife allows herself to be murdered in order to save her husband and father; the culture hero Yu digs the waterways that preserved the world from floods; a mother rescues a nephew at the expense of her own child.

Early medieval images. These Han images are murals in shrines, but during the Tang dynasty (618–907), spirits of all kinds also were represented at their “spirit places” (*shenwei*) on temple altars by spirit tablets (*zhu*), which were vertical planks that recorded the name and title of the divinities they represented. Written records indicate that by this time period, Confucius and other famous literati also were represented by two- or three-dimensional anthropomorphic images on altars where they were given state-sponsored food offerings. Debates ensued over how certain figures should be represented; being depicted sitting rather than standing was considered a mark of honor. These arguments paralleled debates over which textual or spiritual traditions should be granted greater authority: personal disciples of Confucius, or later scholars who transmitted the learning of a particular classic. Because few Tang images exist, their actual appearance is unknown.

One of the most widely known depictions of Confucius is traditionally attributed to the famous Tang painter Wu Daozi (fl. 710–760), although the image's authenticity is questionable. This rendering depicts Confucius as a solitary standing figure, hands held at his chest. A long beard attests to his age and seniority; he is no longer a pupil who bows politely to seek wisdom from others, but is an autonomous, iconic figure presented visually as a model of authoritative gravitas. It is this Confucius who is the subject of modern sculptures in Chinatowns throughout the world.

In other Tang and Song renderings, Confucius is no longer accompanied by his “teacher,” Xiang Tuo, who has instead been replaced by Confucius's favorite disciple, Yan Hui. In contrast to the child prodigy, Yan Hui was noted for his humility. Elsewhere, Confucius is found in poses similar to those of the Buddhist layman Vimalakīrti: he sits on a raised platform and holds a fan. However, instead of an entourage of monks and *bodhisattvas*, he is accompanied by his disciples. These images exist as narrative scrolls on paper and silk, and also as stone carvings displayed in temples.

POLITICAL AND SOCIETAL ACCEPTANCE. Some Song scholars began to express discomfort with anthropomorphic renderings of both historic figures and spirits of natural phenomena, particularly when they were used in ritual contexts.

Images in the Song dynasty. The brothers Cheng Hao (1032–1085) and Cheng Yi (1033–1107) questioned the use of ancestral portraits, especially those wanting in verisimilitude. In addition, Chen Chun (1159–1223) ridiculed the practice of depicting the spirit of sacred Mount Tai as a human king. Taking anthropomorphizing to its logical conclusion, Chen wondered where such a geographically isolated mountain range was likely to find a queen. Distaste for per-

ceived Buddhist influences on Chinese practices, and for the charlatantry that passed for Buddhism, was not far below the surface. Zhu Xi (1130–1200) was troubled that images of Confucius were depicted in ahistorical Buddhist poses, and Cheng Hao ordered the decapitation of a Buddhist statue that gained notoriety by purportedly emitting rays of light.

Elsewhere, artists of the Song dynasty found their subjects in classical texts. Such famous artists as Li Gonglin (c. 1041–1106) created illustrations for the *Book of Filial Piety*, and others illustrated the *Women's Book of Filial Piety*. These works were created in the hand scroll format: a long scroll of paper or silk about one foot in height and several yards in length was illustrated alternately with text passages and accompanying illustrations. Intended for the moral edification and aesthetic appreciation of the viewer, the scroll would be unfurled slowly and the images viewed one at a time, perhaps with the help of an instructor. The twelfth-century painter Ma Hezhi and his calligraphic collaborator, Song emperor Gaozong (1107–1187; r. 1127–1162) chose as their subject the verses of the ancient *Book of Odes*. The cryptic verses and liturgical hymns of the *Odes* were believed to embody the epitome of human sensibility, and were thus a fitting subject for the ruler himself.

For millennia, vessels of bronze and objects of jade have been the vehicles for presenting food offerings and displaying pious sentiments to spiritual beings, and even illustrations of those objects bear iconic status. Several compilations of woodblock illustrations, depicting ritual objects, were created during the Song dynasty. Thereafter, this genre remained popular for centuries. Some of these texts were created for an audience of connoisseurs and antiquarians. However, others were intended as handbooks for those who officiated at rites or were used as visual inventories of sacred objects appreciated for their own sake. The display, arrangement, directionality, and number of particular objects used in ritual performances was of great concern, and Ming (1368–1644 CE) and Qing (1644–1911 CE) dynastic records provide line illustrations that document the placement of each goblet and saucer for spiritual beings of all ranks.

Images in later imperial times. In the Ming, scholars began to question more fundamentally the use of anthropomorphic images in sacrificial offerings. To some thinkers, human-shaped images of clay or paint created by mere artisans blasphemed the subtle formlessness of spirits. Images that did not look like their prototypes were considered invalid. Images of Confucius, for example, could not possibly look like Confucius, for none of them even looked like one another. Others presented xenophobic arguments against Buddhist customs imported from India and against Mongolian Buddhist tendencies (China had been ruled by Mongol people in the thirteenth and early fourteenth centuries) toward iconophilia. By the 1530s, sentiment against anthropomorphic images in temples to Confucius and other literati was so strong that they were ordered eliminated by imperial decree. Sculpted images of clay were replaced by wooden tab-

lets that bore only the names and titles of the deceased. In officially sponsored temples, images remain largely absent from temple altars to this day, although during the late Ming dynasty the ban was occasionally circumvented by hiding images inside temple walls.

Paradoxically, even as sculpted images were being cleansed from the altars of officially sponsored temples, other kinds of images flourished. The expansion of the publishing industry resulted in an unprecedented variety of woodblock illustrations. Many illustrated collections that depicted important events (largely apocryphal) in the life of Confucius were printed, as were illustrated books of filial piety and ritual paraphernalia. Another popular genre was collected volumes of portraits of famous people: historical figures, rulers and ministers, sages and worthies, local heroes, filial children, and exemplars of women's virtues.

In late imperial times Confucius also was popularly depicted in "Three Teachings" images that illustrated how the Confucian, Daoist, and Buddhist traditions (represented by Confucius, Laozi, and Śākyamuni Buddha, respectively) were deeply interrelated. Not everyone believed that Buddhism was a heterodox religion that profaned the teachings of the sages of ancient China. To make the philosophical point that the three traditions were different manifestations of a common substratum, the three figures are sometimes shown schematically as intertwining shapes that form one body, or *ti* (a term that can be applied to a human body as well as a canonical corpus). Other depictions recall the Han representation of Confucius, Laozi, and the child Xiang Tuo. However, in the late imperial images Xiang Tuo is replaced by an infant named Śākyamuni, who is held in Laozi's arms.

During the Qing dynasty, images of Confucius were largely proscribed from official temples and shrines to Confucian sages and worthies, but they were not eliminated at the Kong (the Chinese family name of Confucius) ancestral temples in Qufu in Shandong province, which also maintained a collection of family portraits of "the Sage's" descendants. During the early twentieth century, there was a revival of interest in visual depictions of Confucius. At this time, Confucian associations from around the world returned to Qufu to locate "real" images of Confucius that could be duplicated and distributed in large quantities to promote the values of the *Analects*. The search for verisimilitude was partially fueled by the development of photography.

Twentieth-century trends. During the first half of the twentieth century, political regimes employed images of Confucius or of the Kong family temples to promote their own agendas. In China, the facade of a temple also is understood as a *mian*, or face. Several governments featured Confucius's visage, or that of his temple at Qufu, on their currency. By doing so, they attempted to fortify their own cultural legitimacy and establish a cultural symbol that was palatable to the hundreds of diverse cultural and ethnic groups within China. Even the Japanese puppet government of Manchuria

adopted Confucius on its currency, thus claiming sovereignty over the cultural homeland of Shandong.

With the establishment of the avowedly iconoclastic People's Republic of China in 1949, however, religious and cultural symbols of all kinds (other than those promoted by the Communist Party) were erased in the name of revolution. Even though thinkers such as Kuang Yaming tried to depict Confucius as a "man of the people," "Confucianism" became synonymous with cultural stagnation and economic backwardness. In the civil strife of the Cultural Revolution, the Confucian images at Qufu were disemboweled and paraded around the town in dunce caps, much as if they were living entities. Communist propaganda distributed to adults and children depicted Confucius as a hideous, deceitful, and decrepit old man who was deservedly punished for his reactionary ways by muscular young peasants and laborers.

CONTEMPORARY DEVELOPMENTS. By the end of the twentieth century, revolutionary zeal was supplanted by financial ambition as China became a larger force in the world economy. As China reshaped its image of itself as a nation among equals, it rehabilitated its own culture heroes. Municipal governments and schools refashioned their own civic monuments and replaced statues of Mao with public sculptures of famous world figures from the sciences, the arts, and philosophy. In addition to Newton, Copernicus, Einstein, and Beethoven, these included representations of Confucius. In cinema, the mythic life of Confucius has been featured in several lengthy television series and feature films, where he is often depicted as a virtuous man who successfully withstands adversity.

Confucian temples in Taiwan continue to preserve the Ming tradition of using tablets instead of images, and their walls are dominated by textual and calligraphic icons, when decorated by anything at all. Blood-red tablets mark the names of hundreds of famous literati and invoke their bodies of written work. Inside shrines, altars stand before oversized calligraphed renditions of the *Great Learning*, clearly marking the text as an object of reverence.

In Beijing, which has been an imperial capital since the fifteenth century, the presence of numinous powers also is marked by simple tablets, as well as extensive architectural structures and sacred spaces. The late-imperial Temple of Heaven complex at the southern end of the north-south axis of the city marks the sacrality of the earth with a large open-air circular altar; of heaven, with a smaller, closed structure roofed in blue tiles. The larger Hall of Yearly Harvests architecturally represents the intersection of time and space: the numerical arrangement of columns and shrines marks the four seasons, twelve months, and calendrical days of the year. This complex is oriented with additional temples to the sun and moon in other quadrants of the city's cosmography, making all of Beijing a sacred space shared by humans and spiritual powers.

BIBLIOGRAPHY

For early depictions of the human body in Chinese art, see Helmut Brinker's "The Concept of the Human Body in Chinese Art," in *Symbolik des menschlichen Leibes*, edited by Paul Michel (Bern, Switzerland, 1995), pp. 49–81. Bas-reliefs of the Wu clan shrine are explored in Wu Hung's *The Wu Liang Shrine: The Ideology of Early Chinese Pictorial Art* (Stanford, Calif., 1989). For ancestral portraits, see *Worshipping the Ancestors: Chinese Commemorative Portraits* by Jan Stuart and Evelyn S. Rawski (Washington, D.C., 2001) and Patricia Ebrey's "Portrait Sculptures in Imperial Ancestral Rites in Song China," in *T'oung Pao* 83 (1997), pp. 42–92. Song depictions of Confucian sages and texts are discussed in Julia K. Murray's "The Hangzhou Portraits of Confucius and Seventy-two Disciples (*Sheng xian tu*): Art in the Service of Politics" (*Art Bulletin* 74, 1992, pp. 7–18), as well as her *Ma Hezhi and the Illustration of the Book of Odes* (Cambridge, U.K., 1993). For the *Classic of Filial Piety*, see Richard M. Barnhart's *Li Kung-lin's Classic of Filial Piety* (New York, 1993). For late-imperial narrative scenes in the life of Confucius, see Julia K. Murray's "Varied Views of the Sage: Illustrated Narratives of the Life of Confucius" in Thomas A. Wilson, ed., *On Sacred Grounds: Culture, Society, Politics, and the Formation of the Cult of Confucius* (Cambridge, Mass., 2002), pp. 222–264. For Chinese pictorial collections of sculptures, paintings, and architectural monuments related to the Confucian tradition see the *Rujia tuzhi* (A collection of Confucian images) compiled by Xu Lingyun et al. (Shandong province, China, 1994) and *Dazai Kongzi* (O Great Confucius), edited by Zhang Zuoyao (Hong Kong, 1991). The art and architecture of the temple of Confucius in Qufu is documented in *Qufu Kongmiao Jianzhu* (Architecture of the Confucian temple in Qufu), edited by the Qufu Cultural Administration (Beijing, 1987). For the religious and philosophical significance of images of Confucius, see Deborah Sommer, "Destroying Confucius: Iconoclasm in the Confucian Temple," in Thomas A. Wilson, ed., *On Sacred Grounds: Culture, Society, Politics, and the Formation of the Cult of Confucius* (Cambridge, Mass., 2002), pp. 95–133. Revivals of Confucius as a subject matter for artists is documented in the *Jinian Kongzi danchen 2550 zhounian quanguo meishu zuopin Zhongguohua zuopin ji* (Collection of Chinese paintings from the national art exhibition to commemorate the 2,550th birthday anniversary of Confucius), edited by the editorial committee of the national art exhibition to commemorate the 2,550th birthday anniversary of Confucius (Beijing, 1999). For a European exhibition featuring works related to Confucius and time, see *Confucius: a l'aube de humanisme chinois*, edited by Jean-Paul Desroches (Paris, 2003). For more theoretical studies of visuality in China, see Craig Clunas's *Pictures and Visuality in Early Modern China* (Princeton, N.J., 1997).

DEBORAH SOMMER (2005)

ICONOGRAPHY: JEWISH ICONOGRAPHY [FIRST EDITION]

Jewish iconography, whether actually represented in works of art or existing only as traditional imagery (and occasionally referred to in literature), was determined from the first by the biblical “prohibition of images.” This prohibition, transmitted in the Bible in several versions, could be understood (1) as forbidding, in a religious context, all images, regardless of their subject matter (*Ex.* 20:4, *Dt.* 4:15–18), or (2) specifically forbidding the depiction of God and the ritual use of such a depiction as an idol (*Dt.* 27:15). While the first interpretation of the prohibition did not prevail (the Bible itself provides evidence of this in *1 Kgs.* 6:23–29, *Ez.* 8:5–12), the other was consistently implemented. Possibly the most striking feature of Jewish iconography throughout the ages is the systematic avoidance of any depiction of the figure of God. To a large extent this is also true for saintly personages: though hagiographical literature emerged in Judaism, it was not accompanied by any visual imagery of saints. From the beginning, then, Jewish religious iconography developed in marked contrast to the traditions predominant in the Christian West. Since the loss of political independence in 71 CE, Jewish imagery could not be formed within the framework of a state art and did not enjoy any official support for its symbols. As the art and imagery of a religious minority, however, it flourished in the Diaspora throughout the ages. The iconography that emerged within these limitations developed mainly in a few periods and thematic cycles.

HELLENISM. The meeting between Judaism and the Greek world—a process that lasted from early Hellenism to late antiquity (roughly, second century BCE to fifth century CE)—resulted in a body of religious images. While the Mishnah and Talmud were being compiled (roughly second to sixth centuries CE) Jewish communities produced a large number of representations, which have been uncovered in Jewish remains (mainly synagogues and burial places) from Tunisia to Italy and eastward to the Euphrates; sites in Israel are particularly rich. Occasionally this imagery includes human figures, either in biblical scenes or in pagan myths (frequently the image of Helios, the Greek sun god).

More often, however, these survivals show objects with definite ritual connotations. Most prominent are the seven-branched *menorah* (candelabrum), Aron ha-Qodesh (the Ark of the Covenant), *lulav* and *etrog* (palm branch and citron), and shofar (ceremonial animal horn). These objects (which reflect the crystallization of Jewish ritual) have no strict hierarchy, but the *menorah*, and the Ark of the Covenant, representing the law itself, are more important than the others. When both are shown together, they always occupy the central place. Besides such explicitly ritual objects, Jewish remains abound in artistic motifs, taken over from Hellenistic art, whose symbolic character is obscure. A good example is the vine, most likely derived from contemporary Dionysian imagery and often found in Jewish cemeteries. But whether in Jewish communities it carried the meaning of salvation that it had in the pagan world is a matter of dispute. Some

modern scholars tend to see these motifs as “decoration” devoid of articulate symbolic meanings; others, especially Goodenough, attribute established symbolic meanings to them.

MIDDLE AGES. In the European Middle Ages, especially between the thirteenth and fifteenth centuries, Jewish religious imagery developed further. The illumination of manuscripts is the central aesthetic medium of the period; of particular significance are the manuscripts produced in Spain, Italy, and Germany. All these manuscripts are of a ritual nature, the most important groups being the Haggadah for Passover and prayer books for the holidays, the *mahzor*. The illuminations (and later, printed illustrations) represent many ritual utensils, but they also include, more often than in Jewish art of other periods and media, human figures, especially in biblical scenes. The iconographic repertoire is enlarged by mythical motifs, attesting to messianic beliefs. Among these motifs are the legendary beasts (such as the *shor ha-bar*, a kind of wild ox), on which the just will feast on the day of redemption; these are particularly prominent in manuscripts produced in Germany. The future Temple that, according to common belief, is to be built after the redemption, is another frequent mythical motif, especially in Spanish and German manuscripts; it is sometimes patterned after contemporary Christian models. Both the temple building and the ritual utensils (the latter sometimes rendered on the opening folios of Bible manuscripts produced in Spain) may be taken as expressions of “the ardent hope and belief” to see the “restored Temple in the messianic future.” In countries under Islamic rule, Jewish art readily adapted the aniconic attitude and the repertoire of decorative motifs common among the Muslims, although in literature, visual imagery continued to thrive in the form of metaphors and descriptions.

QABBALISTIC SYMBOLISM. The qabbalistic tradition is a special field of iconographic creation. Qabbalistic literature abounds in visual metaphors, since the authors often tend to express (or to hide) their thoughts and mysteries in visual images and descriptions of supposed optical experiences. Since the beginnings of Jewish mysticism in late antiquity, a continuous tradition of visual symbols has persisted. Considerably enriched in the Middle Ages, and in the seventeenth century, this tradition remained unbroken up to, and including, Hasidic literature. The central image of qabbalistic symbolism is the Tree of Sefirot. The godhead is imagined as structured in ten spheres, each of them representing a “divine quality” (Heb., *sefirah*). The shape and place of the spheres, and the spatial relationships between them, are firmly established in the qabbalistic imagination. The overall pattern vaguely resembles a tree (hence the name), but the basic character of the image is abstract rather than figurative. Though the Tree of Sefirot has frequently been depicted (mainly in simple form, primarily in popular printed editions) and has exerted some influence on contemporary Jewish painters, the image is not primarily an artistic one; rather, it is still widely known from the literary sources.

Qabbalistic literature produced other visual symbols, among them the images of broken vessels, scattered sparks, Adam Qadmon (primordial man) as a figure of God, and so forth. Scholem has also shown that an elaborate color symbolism emerged in the qabbalistic literature. In modern civil societies, Jewish iconography is still in the process of formation and has not yet been properly studied.

SEE ALSO Biblical Temple; Qabbalah; Synagogue.

BIBLIOGRAPHY

For the imagery of the Hebrew Bible (though not necessarily in art only) still useful is Maurice H. Farbridge's *Studies in Biblical and Semitic Symbolism* (1923; reprint, New York, 1970). Erwin R. Goodenough's *Jewish Symbols in the Greco-Roman Period*, 13 vols. (New York, 1953–1968), has a rich collection of photographs; the text is stimulating, albeit sometimes arguable. Mainly for the Middle Ages, see Jacob Leveen's *The Hebrew Bible in Art* (1944; reprint, New York, 1974). For early modern times, see *Beauty in Holiness: Studies in Jewish Customs and Ceremonial Art*, edited by Joseph Gutmann (New York, 1970), a catalog of Jewish artifacts from the Prague Museum shown at the Jewish Museum in New York.

Much can be learned from the discussion of single problems. See, for example, *The Temple of Solomon*, edited by Joseph Gutmann (Missoula, Mont., 1976). Another individual problem is discussed by Zofia Ameisenowa in "The Tree of Life in Jewish Iconography," *Journal of the Warburg and Courtauld Institutes* 2 (1938–1939): 326–345. Qabbalistic imagery is best discussed in Gershom Scholem's *Major Trends in Jewish Mysticism*, 3d rev. ed. (New York, 1954), esp. pp. 205–243. A highly interesting study of a particular subject in qabbalistic symbolism is Scholem's "Farben und ihre Symbolik in der jüdischen Überlieferung und Mystik," *Eranos Yearbook* 41 (1974): 1–49, *The Realms of Colour* (with English and French summaries).

MOSHE BARASCH (1987)

ICONOGRAPHY: JEWISH ICONOGRAPHY [FURTHER CONSIDERATIONS]

In his 1987 *Encyclopedia of Religion* article, Israeli art historian Moshe Barasch surveyed some of the important issues and artistic genres in the history of Jewish art as they were understood by historians of Jewish art of his generation. Within that community, scholars were often reacting against a deep prejudice against Jewish art—and even the possibility of Jewish art—that was deeply ingrained in the Western discourses on art and on the relation of art and Judaism. This reaction against prevalent notions that Judaism was aniconic (without symbols or icons), iconophobic, or otherwise antithetical to art resulted in the discovery, publication, and exhibition of artifacts of Jewish art and archaeology.

APOLOGETICS AND EARLY RESEARCH. With few exceptions, late nineteenth- and twentieth-century scholarship did not face the prevailing prejudice against Jewish artistic production head on. Rather, it was refuted indirectly through dis-

covery, scholarly publication, and the public exhibition of Jewish art (often in museums established by Jewish communities for the purpose). Early scholarship was carried out mainly by non-Jewish scholars, generally with Jewish financial backing. This was thought to afford this research with greater veracity. Notable among scholarly writings of this early period was art historian J. von Schlosser's pathbreaking work on Hebrew manuscripts, *Die Haggadah von Sarajevo: Eine spanisch-jüdische Bilderhandschrift des Mittelalters* (1898), with Jewish scholar D. H. Müller and a contribution by David Kaufmann; classicists Heinrich Kohl and Carl Watzinger's *Antike Synagogen in Galilaea* (1916); and Heinrich Frauberger's revolutionary work on Jewish ceremonial art, *Ueber Alte Kuntusgegenstände in Synagoge und Haus* (1903).

Since World War I the majority of scholarship has been carried out by Jews, usually within the contexts of Judaic studies. The prominent exceptions all focused on the Greco-Roman period: Carl Kraeling's exceptional final report of the Dura Europos synagogue, Kurt Weitzmann's interest in this material for the study of early Christian art, and Erwin R. Goodenough's provocative *Jewish Symbols in the Greco-Roman Period* (1953–1967). Zionist and Israeli scholarship has been particularly prominent as Jewish art scholarship was formulated in nationalist terms. E. L. Sukenik's studies of Jewish archaeology—particularly his discovery of ancient synagogues and Second Temple (536 BCE–70 CE) period tombs—and Mordecai Narkiss's studies of ceremonial art and his project of building the Bezalel National Museum (now part of the Israel Museum in Jerusalem) are notable, particularly Narkiss's *The Hanukkah Lamp* (1939, in Hebrew). His son Bezalel Narkiss's work during the second half of the century focused on medieval manuscripts and the assembly of an *Index of Jewish Art* to serve as an adjunct to the Princeton Index of Christian Art, which is the main project of his Center for Jewish Art at the Hebrew University of Jerusalem. Narkiss founded *The Journal of Jewish Art* (now *Jewish Art*) in 1974 as an annual, although for the last decade it has appeared less frequently. At midcentury important contributions were made, particularly by expatriate Germanophones in America and Israel—most prominently by Rachel Wischnitzer, Franz Landsberger, Michael Avi-Yonah, and Stephen S. Kayser. More recently, Isaiah Shachar, Joseph Gutmann, Rachel Hachlili, Abraham Kampf, Carole Krinsky, Shalom Sabar, Vivian Mann and others have made Jewish art from antiquity to the modern period widely available and known. Much of this scholarship has focused on primary publication of artifacts (and in Mann's case, also primary texts) and building the corpus of Jewish art. The varied audiences for whom scholars wrote are significant. Some focused on academic Jewish studies contexts (e.g., M. Narkiss, Wischnitzer, Kayser, Kraeling, Shachar, Gutmann, Sabar, and Mann), others located their work within general art history and archaeology (e.g., Avi-Yonah, Kraeling, Weitzmann, B. Narkiss, Gutmann, Krinsky, and Hachlili), and

still others sought to integrate it within the history of religions approach (e.g., Goodenough).

More recently social historians with less of an object-focus have developed interests in Jewish art. Most prominent among these are Richard I. Cohen and Ezra Mendelsohn. Explicit reflection on the study of Jewish art has been rare. Perhaps the most interesting conceptualization developed during the first half of the twentieth century was presented by German/Israeli art historian Heinrich Strauss, who, against the tide, referred to Jewish art as a “minority art.” Most reflection tended to be apologetic, as in Cecil Roth’s introduction to his seminal widely influential edited volume, *Jewish Art*, first published in 1956 and still in print in Hebrew. Roth’s anthology, which begins with the Biblical period and concludes with then-contemporary art and architecture, was intended to serve as an introduction to Jewish art through the ages. He begins this monumental project with the apology that “the conception of Jewish art may appear to some to be a contradiction in terms: for there is a widespread impression that in the past visual art was made impossible among the Jews by the uncompromising prohibition in the Ten Commandments. . . .” (Roth, 1961, p. 11).

As late as 1988 archaeologist Rachel Hachlili introduced her important study, *Ancient Jewish Art and Archaeology in the Land of Israel* with the confession: “For some time now I have felt the need for a comprehensive study, which would support my thesis for the existence of an ancient Jewish art.” (Hachlili, 1988, p. xxi). For most of the twentieth century the backdrop for Jewish study of this material was often the need to prove and legitimize its very existence. This project has been intertwined with the opening and expansion of Jewish museums (of which there are now around fifty in the United States alone), the Center for Jewish Art, excavation of archaeological sites, the publication of popular books, and the use of Jewish art as a source of symbols by the State of Israel. Ideology has generally not impinged on the quality of scholarship. During the closing decades of the century the apologetic impulse was in steep decline both in the public sphere and in scholarship.

Beginning during the mid-1990s and continuing into the twenty-first century, a major reevaluation of the place of Jewish art in Western culture has been undertaken by Annabelle Wharton, Catherine Soussloff, Kalman Bland, Margaret Olin, Yaakov Shavit, Avner Holtzman and other scholars. This reassessment is very much in motion, although it has already begun to receive some critical response. Writing in the postmodern mode, each of these scholars has focused on the historiography of Jewish art, setting scholarship of the late nineteenth and twentieth centuries within the general discourses on art and Judaism during this period. This scholarship follows a general trend in history writing during this period, in which reevaluation of humanities scholarship across the spectrum has been a major preoccupation.

The contemporary art world’s ambivalent attitude toward Judaism was addressed in Norman Kleeblatt’s *Too Jew-*

ish: Challenging Traditional Identities, a major traveling exhibition of contemporary art with Jewish themes organized by the Jewish Museum in New York in 1996. Annabelle Wharton (1994) was the first to address these issues in an American academic context, focusing on the colonialist ways that the Dura Europos synagogue has been studied since its discovery in 1932 and the ways that these approaches have colored interpretation. The academic watershed, however, was Catherine Soussloff’s edited volume, *Jewish Identity in Modern Art History*, published in 1999. The assembled studies, composed by historians and art historians (although significantly, no specialists in Jewish art) suggest the absolute ambivalence (if not contempt) that art historical scholarship, often carried out by Jews, has shown toward Judaism and Jewish art. The importance of this volume is in the fact that it brought together scholars working in diverse areas of art history to shine a focusing lens on the issue of art historical constructs of Jewish visual culture. This early statement of the problem was the harbinger of the first monographs to approach Western conceptions of Jewish art.

Kalman Bland, a contributor to Soussloff’s volume and a colleague of Wharton’s at Duke University produced the first monograph on Jews and art. Bland discussed the nineteenth century philosophical roots of this phenomenon in his *The Artless Jew: Medieval and Modern Affirmations and Denials of the Visual* (2000). Still schematic in its approach, Bland succeeds in tracing the denial of Jewish visibility to the thought of Immanuel Kant (1724–1804), who praised Jews for being aniconic like German Protestants, and G. W. F. Hegel (1770–1831), who damned them for the same supposed aniconism. Bland also began to show ways that Jews of different allegiances responded to these approaches. In general, classical Reform Jews, who denied Jewish peoplehood also denied the existence of Jewish art, a national art being impossible for a nonpeople. This conception brought Judaism close to Protestant ideals. The stakes in Jewish aniconism were large for Protestants, who believed that the earliest Christians were aniconic—like the ancient Jews, their religion corrupted by pagan influences, resulted in Christian art, and the “idolatry” of the Catholic church. Jews committed to Jewish peoplehood (both Zionist and non-Zionists), however, reacted strongly to the notion that Judaism was artless and set out to prove this paradigm wrong. These Jews found support in Catholic praise of ancient Jewish art, which Catholic scholars saw as the predecessor to their own artistic tradition. It is not surprising that the earliest Jewish art scholarship was centered in Catholic Budapest, where Kaufmann and his students worked within a generally supportive intellectual environment—and not in Protestant lands.

Margaret Olin, a contributor to both Kleeblatt’s and Soussloff’s volumes, published *The Nation Without Art: Examining Modern Discourses on Jewish Art* in 2002. This monograph presents case studies in the historiography of art history regarding Jews. Olin’s discussions of nineteenth and twentieth century conceptions in the German academy and

Jewish responses to this artlessness are particularly relevant. Olin's main focus is the notion that each nation has a unique and distinctive national art (with its own style and iconography), and the problems created by such classifications. For Judaism in particular, notions of Jewish peoplehood and nationality were basic to the construction of Jewish identity during the nineteenth and twentieth centuries and hence the existence or nonexistence of Jewish art was an important statement of Jewish self-understanding and the ways that Jews were viewed by the majority Western cultures. Olin focuses on Zionist responses to Jewish artlessness, David Kaufmann's early scholarship on Jewish art, and art historical approaches to the Dura Europos synagogue, as well as attitudes toward more contemporary art by Jews. Her study of Dura is particularly insightful, exposing a deeply anti-Semitic strain in European scholarship (associated with proto-Nazi scholar Josef Strzygowski, who placed the origins of Christian art firmly in the East, in a Jewish context) and ways that it influenced scholarship on Jewish art at midcentury (particularly by the philo-Semitic German expatriate art historian, Kurt Weitzmann). Her discussions of more contemporary manifestations, as expressed in studies of Clement Greenberg, George Segal, and others point to the continuation of this phenomenon through the second half of the century.

Parallel to the development of this corpus, Yaakov Shavit (1992; 1997) followed by Avner Holtzman (1999) has focused on ways that Zionists conceptualized art against the background of Eastern European Jewish ambivalence toward non-Jewish art forms and the place of art in Jewish-Palestinian culture of the pre-State era before 1948.

SECOND WAVE. The second wave of studies dealing with these issues is being written by historians who are applying the insights of previous studies directly to the study of ancient art and religion. In a series of articles influenced by Olin and others, British classicist and art historian Jaś Elsner has moved from a rather negative position vis-à-vis Jewish art and its relation with Christian art during late antiquity to a position that subsumes Jewish, Christian, and pagan art together under a broader category of Late Antique art. According to Elsner's new approach, Jewish art is not merely a backdrop to Christian art but an equal. Steven Fine's *Art and Judaism During the Greco-Roman Period* (2005) discusses ways that the "artless Jew" trope affected historiography of ancient Judaism, particularly the work of E. R. Goodenough, M. Smith, and Smith's students (among them Jacob Neusner, S. J. D. Cohen, and Lee Levine). The assumption that Jews are artless was transformed by Goodenough into the notion that whereas Jews created art, the Talmudic rabbis were anti-art. Extant Jewish art was therefore often conceived as nonrabbinic. Reevaluating ancient Jewish attitudes toward art as reflected in both literary and archeological sources, Fine demonstrates coalescence between Jewish and general Greco-Roman art except in areas in which Jewish values (which were scripture-based, but open to varying interpretations and circumstances) were at variance with general attitudes.

Recent developments in the historiography of Jewish art have changed the conceptual frame within which this discipline functions. By exposing the often anti-Semitic (and sometimes anti-rabbinic) roots of many of these conceptions, scholars of the late twentieth and early twenty-first century have created a level playing field in which the study of Jewish material culture may be pursued without engaging in the types of implicit and overt apologetics that were so often necessitated during the nineteenth and twentieth centuries.

BIBLIOGRAPHY

- Bland, Kalman P. *The Artless Jew: Medieval and Modern Affirmations and Denials of the Visual*. Princeton, N.J., 2000. The first monograph on Western discourse on Jewish art, Bland also briefly surveys Jewish attitudes toward the visual, as well as selected issues of aesthetics in Jewish thought.
- Cohen, Richard I. *Jewish Icons: Art and Society in Modern Europe*. Berkeley, Calif., 1998. Cohen presents historical case studies of the reception of Jewish art during the nineteenth century.

- Wharton, Annabel Jane. *Refiguring the Post Classical City: Dura Europos, Jerash, Jerusalem, and Ravenna*. Cambridge, U.K., 1995. Wharton was the first American scholar to discuss problematic Western views of Jewish art, focusing on the Dura Europos synagogue.

STEVEN FINE (2005)

ICONOGRAPHY: CHRISTIAN ICONOGRAPHY

For the greater part of Christian history, the church’s images have been drawn from its liturgical texts, scriptures, and ped-

agogy, and they have been rendered in the styles of the particular age and place the images served. In modern times, the sources for Christian iconography have expanded to include psychological, sociopolitical, and nontraditional elements.

The most distinctive characteristic of Christian iconography is its preoccupation with the person and role of Jesus Christ (and his followers). The image of Christ as earthly founder and heavenly savior is central to the religion, especially insofar as the church defines itself as the body of Christ on earth. Thus the changing repertoire of images of Jesus and his followers reveals the nature of the religion in its many cultural and historical manifestations.

EARLY CHRISTIANITY. Early Christian art surviving from the first half of the third century reflects the diversity of the Greco-Roman context from which it emerged. The earliest iconographic figures, borrowed directly from late antique conventions, were placed in new compositional and environmental settings on jewelry and other minor arts. For example, the common pose of the shepherd Endymion, a reclining male nude resting on one elbow with ankles crossed, was the type borrowed by artists to depict the Old Testament figure of Jonah resting under an arbor. For Christians, Jonah represented an image of resurrection and, as such, was used in funerary paintings and low-relief carvings on sarcophagi. Old Testament figures used in early Christian iconography appeared almost exclusively as typologies of Christ and his followers.

The earliest images of Christ were concerned with his person and role on earth and were borrowed from classical types of teaching figures, miracle workers, and heroes. Conventions for depicting divine attributes were missing, and there was no attempt at historical accuracy. Jesus did not look like an early-first-century Jewish man from Palestine, but like a Roman teacher-philosopher or like an Apollo-type mythic hero such as the Christos-Helios mosaic figure in the necropolis of Saint Peter’s Basilica in Rome. Frustration with the limitations of these typologies seems to have led to symbolic representations, such as the ubiquitous Christ as Good Shepherd and the emblematic cross and wreath symbolizing the Trophy of Victory on sarcophagi. The Good Shepherd image was adapted from pagan culture, while the Trophy was the earliest representation of the Christian cross.

IMPERIAL CHRISTIANITY. Following the adoption of Christianity as a state religion by the Roman emperor Constantine in the early fourth century, the figure of Christ as the imperial reigning Lord emerged. Jesus enthroned as the leader of the church, or in the heavens as an imperial judge, reflected the power the church had gained in that era. Within a hierarchically structured society, Jesus was depicted as a reigning philosopher-emperor who dispensed grace and judgment above all earthly power (see, for instance, the enthroned Christ in the apse mosaic of Santa Pudenziana in Rome).

Theological teachings and conciliar rulings are reflected in the Christian iconography that followed. From the fourth through the sixth century the figure of Jesus, elevated to a

ruler over all, came to represent the power of the church over state and society. Christ seated in majesty above the heavens in the apse mosaic of the mausoleum of Santa Constanza in Rome (c. 350) or in the apse mosaic of the Church of San Vitale in Ravenna, Italy (c. 550), reflects Christological formulations. Mary appears as an enthroned queen in the mosaics of Santa Maria Maggiore, Rome, after the Council of Ephesus in 431, which declared her *theotokos*, Mother of God. Two types of Christ figures occupy the twenty-six mosaic panels of the Christ cycle in San Apollinare Nuovo in Ravenna (c. 520). The figure in the scenes of Christ's ministry and miracles is an Apollo type—young, beardless, and dressed in royal purple—while the figure in the scenes of Christ's last days on earth is a philosopher type—older, bearded, also dressed in purple. These two figure types reflect Pope Leo the Great's late-fifth-century theological treatise on the two natures of Christ.

Explicit representation of the crucifixion of Jesus is conspicuously absent from early Christian iconography prior to the fifth century. The visual representation of Jesus' crucifixion and resurrection was reserved to be seen only for those who have been baptized. By the early fifth century, on rare occasions, crucifixion scenes appeared on liturgical objects and other church furnishings, such as the wooden doors of the Church of Santa Sabina in Rome. Nonetheless, the crucifixion is missing as an episode in the Christ cycle of the nave mosaics in the early-sixth-century Church of San Apollinare Nuovo in Ravenna. Once the crucifixion came to be widely depicted, the preferred type in both East and West through the ninth century was a robed, open-eyed, victorious Christ hanging on the cross, such as the ones in the illuminations of the Rabula Gospels from Mesopotamia (dated 586) or on the wall decorations of the Church of Santa Maria Antiqua in Rome.

From early Christian times to the ninth century, themes of rescue, delivery, and victory were dominant. Figures introduced as graced believers eventually became regal symbols of transcending powers. Mary, for instance, in third-century Roman fresco painting, was a Roman citizen; in the fourth century she acquired the dress of an aristocratic lady, and in the fifth, she was the queen of heaven. By the ninth century she was a reigning personification of the church.

BYZANTINE ART. Within the art of the Eastern Orthodox Church, the image (as icon) relates to the liturgy in a manner distinguished from that of its Western counterparts. An icon can appear in a variety of media: painting, mosaic, sculpture, or illuminated manuscript. Its subject matter includes biblical figures, lives of the saints, and scenes and narrative cycles that relate specifically to the liturgical calendar. To the present day, Byzantine tradition relies heavily on iconography in its worship. On the iconostasis—the screen extending across the front of the worship space in the Byzantine tradition—icons of Christ, Mary, and the saints appear as physical representations of the real spiritual presence of these figures for the worshippers, thereby creating the most integral and dy-

namic use of iconography in worship among all Christian traditions.

Over the centuries, rules for iconographers in the East were formalized, and copy books determined the style and subject matter of iconography. Paintings of the crucifixion in the Byzantine tradition, for example, often include the figures of Mary and Saint John at the foot of the cross in attitudes of grief, and the corpus traditionally hangs in a limp curve against the rigidity of the cross. This form then became popular in the West, especially in medieval Italy, and influenced painters such as Cimabue (d. 1302?).

Icons of the Madonna as the Blessed Virgin, Mother of God, emphasizing her role as mediator and eternal spirit of consolation and blessing, are numerous in Eastern iconography, but the single most imposing and austere composition in Byzantine iconography is the Pantocrator icon of Christ. The frontal presentation of this image emphasizes the presence of Christ as coeternal and coexistent with God the Father. Theologically, the Pantocrator gave visible form to the church's teachings on the consubstantiation of Father and Son, just as the Transfiguration icon visualized its teachings on the incarnation of God in Christ. The religious and social power of icons in society is reflected in the Iconoclastic Controversy of the eighth and ninth centuries, which produced a body of writings on the theology of iconography never again matched in Christian history.

MIDDLE AGES. While saints, heroes, and narrative episodes from scripture dominated medieval iconography, rich patterns of decoration and reference to everyday contemporary life worked their way into the art of the church in the West. Sculptural programs on church buildings and marginalia in illuminated manuscripts introduced genre scenes such as the symbols for the labors of the months and images for the seven liberal arts.

Christian iconography produced in the eighth and ninth centuries became regionally acculturated as its Roman origins disappeared in the face of indigenous expression. Elaborate decorated surfaces enclosed Christian symbols and figures, where, in the service of beautiful patterns, iconography became abstract and emblematic, especially on painted vellum in books.

During the ninth and tenth centuries a shift in emphasis from Christ the victor to Christ the victim took place in the thinking of the church; accordingly, images of the crucifixion with the victorious reigning Lord on the cross were replaced by those of the suffering human victim. The Gero Crucifix in the Cathedral of Cologne, Germany (c. 960), is one of the earliest representations of Christ as a suffering, dying figure. Under the influence of Anselm (d. 1109) the emphasis on the purpose of Christ's sacrifice shifted from the act necessary to defeat the devil to the act necessary to satisfy God on behalf of the world. Christian iconography of the crucifixion reflected that shift. Simultaneously, the role of Christ as a stern and eternal judge was emphasized in sculp-

tural programs on the exterior of monastic churches such as those at Moissac and Autun in France. Images of Mary as mediator, together with the lives of the saints as models of virtue and fidelity, presented an array of images for instruction and contemplation.

By the twelfth century the decorative, narrative, and didactic role of the arts gave way to an explicitly sacramental function, one in which the imagery appeared in a context believed to be a model of the kingdom of heaven, the church building. Iconography in the church was believed capable of building a bridge that reached from the mundane world to the threshold of the divine spirit. Described in twelfth-century Christian literature as anagogical art, iconography served as an extension of the meaning of the Mass. Visual images led believers from the material to the immaterial (see Suger, 1979). In a Gothic cathedral the sculptural programs (statue columns, tympana, archivolt, capitals, screens) and painted glass included figural compositions that narrated scripture, historical events, literature, and daily life, and all were considered to have an anagogical function.

In the Gothic era a proliferation of Old Testament imagery reflected renewed theological and political interests in manifestations of God working within and through royal hierarchies. During this period the suffering Christ of the Romanesque style became a more benign savior. More types of Christ figures appear in the sculptural program and stained glass of Chartres Cathedral from the twelfth and thirteenth centuries than in the most elaborate Romanesque iconographic schemes. The quantity of figures was more important to the Gothic planners than to any of their predecessors, owing to the twelfth-century belief in the anagogical function of art.

In the late Gothic period (approximately the fourteenth and fifteenth centuries) across northern Europe, the iconography of Christianity was populated with aesthetically appealing, elegant figures and decorative surfaces known in modern scholarship as the International Style. Attitudes, dress, and colors emphasized soft, flowing lines, gentle expressions, and rich textures.

RENAISSANCE AND REFORMATION. Christian iconography of the Renaissance in Italy acquired classically human characteristics as interest in Greco-Roman literature and art was revived. Jesus and his followers appeared in a human guise heretofore unknown. Scenes of biblical episodes and historically religious significance were given the illusion of three-dimensional settings that emphasized their reality in the natural world. Fifteenth-century Renaissance art reflected renewed interest in pagan mythology and Christian subject matter alike; therefore, pagan iconography competed with traditional Christian iconography. Proportion, perspective, and human experience were new ingredients in the iconography of the Renaissance. For example, between 1495 and 1498 Leonardo da Vinci completed the *Last Supper* on the wall of the refectory of Santa Maria della Grazie in Milan, Italy. Leonardo's painting of the figures within a perspectival

view of a room centered on Christ renders the moment as one of self-conscious and anxious questioning among the twelve apostles. This painting has become the most popular and most often reproduced object of Christian iconography.

In an age in which "man was the measure of all things," the types of human figures ranged between idealized and ethereal images, such as Raphael's *Madonna del Granduca* (1505) and the anxious and suffering figures in Michelangelo's Sistine Chapel *Last Judgment* (1536–1541). In the latter, terror lurks in the consciousness of the sinful, and the blessed rise passively to a severe and enigmatic Lord.

In northern Europe in the fifteenth and sixteenth centuries, exaggerated realism in the treatment of subject matter and pre-Reformation currents of thought shaped Christian iconography. Matthias Grünewald's famous crucifixion panel in the Isenheim Altarpiece (1510–1512) presents Christ as a victim whose physical appearance betrays mutilation and disease; the panel emphasizes divine participation on behalf of human suffering.

Specifically Reformation iconography illustrated biblical teaching and liturgical practices by the reformers. Lucas Cranach the Elder, a painter and a friend of Martin Luther, presented the subject matter of one of Luther's sermons in the figure of the crucified Christ in the Wittenberg Altarpiece of 1545. Here, Christ appears classically proportioned, alive, and without signs of maltreatment. Albrecht Dürer's engravings and woodcuts, known to a wide-ranging public, in some instances reflected contemporary religious thought as well. Whereas the old *Andachtsbild* (image for contemplation) tradition in medieval Christian iconography served prayer and meditation, many of Dürer's engravings engaged the intellect and gave focus to religious thought and theological propositions.

Reacting against "papist" imagery, Reformation iconoclasts destroyed vast amounts of iconographic imagery and liturgical furnishings. For its part, the Roman Catholic Church consciously appropriated iconographic programs in their churches in order to counteract the reforming movements. The Council of Trent, held in the middle of the sixteenth century, formulated instructions on the uses of iconography on behalf of the church. If the Reformation in some areas limited or forbade the use of images in the church, the Counter-Reformation encouraged a proliferation of them, thereby stimulating the introduction and expansion of the Baroque style of art. Eventually the church's use of Baroque forms extended beyond traditional sculptural programs and painted panels to wall-surface decor, ceiling plaster, frescoes, elaboration of vestments and liturgical vessels, and extensive programmatic designs for altars and chapels. Dramatic highlighting, theatrical effects, and atmospheric illusions were used with iconographic programs to convince believers that the authentic home of spirituality and the true seat of the church's authority was in the Roman Church.

SEVENTEENTH AND EIGHTEENTH CENTURIES. Protestant iconography in the seventeenth century emphasized individ-

ual experience, and images of Jesus stressed his humanity and participation in the human condition. Rembrandt's portraits of Jesus, for example, show a thirty-year-old Jewish man; his *Deposition from the Cross* (1634) emphasizes a Christ broken and dead. Roman Catholic iconography, by contrast, stressed the sacramental presence of a heroic Christ in programmatic sequences, such as Peter Paul Rubens's early altarpieces and Nicolas Poussin's two series of paintings entitled *The Seven Sacraments* from the 1640s.

Eventually, architects created iconographic environments in church interiors that approximated a heavenly realm, decorated with ethereal figures of saints. As the German Rococo churches attest (see, for example, the Bavarian pilgrimage churches of Balthazar Neumann at Vierzehnheiligen and Dominikus Zimmermann at Wies), the setting for the sacrament was an integration of iconography and architecture that established a place separate from the natural world.

THE NEW WORLD. While the excesses of Rococo iconographic decoration engulfed worship spaces in eighteenth-century Europe, the New World seemed austere by contrast. Late-seventeenth-century Christian iconography in North America consisted primarily of small, colorful panel paintings for the Spanish-American communities of the Southwest and of a conservative form of monochromatic portraiture on the East Coast. The art of the Southwest reflected a Spanish Roman Catholic culture with its indigenously adapted Baroque forms. By contrast, the arts introduced by the Puritans in New England were understated to the point of asceticism and iconoclasm. The elimination of imagery and decoration left a Christian iconography of simple abstract elements created by natural materials and excellent craftsmanship. Early American meetinghouse architecture symbolized a community's place of contact with itself and with God, specifically the word of God. Shaker communities, for instance, made a virtue of functional beauty and created a repertoire of objects that were revered for their clarity of form and usefulness. Cemetery art in eighteenth-century New England relied on simple abstract symbols reduced to line drawings in stone, representing angels' heads or skulls with wings.

The earliest Christian imagery in North America, as found in Western Hispanic communities and the Puritan centers in the East, drew on separate European traditions and enjoyed no cross-fertilization. In the Southwest, images of Christ's crucifixion served Roman Catholic liturgical traditions, public and private. In New England any iconography that suggested a Roman Catholic influence was considered "papist" and inappropriate. Not only were images of the crucifixion rare, but many churches refused to display the symbol of the cross in order to avoid appearing idolatrous.

By the late eighteenth century, the major trends in Christian iconography were competing with the secularization of Western culture and the impact of the Enlightenment. The American and French revolutions witnessed the

destruction of institutional hierarchies and the great Christian monuments associated with them. In France, for instance, the dismantling of the medieval monastery at Cluny and the destruction of royal imagery on Gothic churches at Notre-Dame and St.-Denis in Paris demonstrated the negative power of Christian iconography that appeared to be royalist.

Nonetheless, during this period the private vision of artists dealing with Christian themes added an enigmatic dimension to religious iconography. For instance, William Blake's figures from the late eighteenth century combined traditional Christian subject matter with his own imaginative intuition. Whereas the human condition had always impinged upon and shaped the priorities of traditional Christian iconography, personal insight shaped primary subject matter in the latter half of the eighteenth century.

NINETEENTH CENTURY. Prior to the Enlightenment, the life of the Christian church, theologically and liturgically, influenced the images and forms of art directly: Christian iconography reflected the "mind" of the church. In the nineteenth century, Christian iconography served more private and artistically formal purposes. The recovery of historical styles in nineteenth-century art and architecture carried with it renewed interest in Christian iconographic themes. The English Pre-Raphaelites, for example, sought to recover the artistic values and qualities of the high Middle Ages. (See, for example, the Edward Burne-Jones mosaic decoration for Saint Paul's Within-the-Walls in Rome, begun in 1881.) Generally speaking, nineteenth-century Christian iconography was created to celebrate a popular style—whereas in the past, style had been shaped by its ecclesiastical settings and patrons.

Claims about the sublime as perceived in nature or in the depths of human consciousness created new aspects of religious iconography in the eighteenth and nineteenth centuries. After the Enlightenment, the canon of iconographic subject matter became open-ended. As the formal aspects of artistic production became foremost for artists who in previous centuries would have been concerned with narrative force and meaning, iconographic expression became more independent and individual. For instance, Vincent van Gogh (d. 1890), who in his early life had been a Christian missionary, created a personal iconography that eschewed, for the most part, any specifically Christian subject. Paul Gauguin's (d. 1903) paintings of Old Testament subjects, the crucifixion, or religious imagery from life in Tahiti created a recognizable but private iconography that reflected individual interests and goals. The institutional church, for the most part, disengaged itself from major artists and movements. Under these circumstances, by the late nineteenth century a great part of Christian iconography had become copy work, sentimental and remote from the society at large.

TWENTIETH CENTURY. A highly individualized Christian iconography was shaped in the twentieth century by the religious consciousness of individual artists. The German ex-

pressionists, for example, insisted upon interpreting and revealing their individuality. When Wassily Kandinsky (d. 1944) wrote *Concerning the Spiritual in Art*, what was revealed in the art included the feelings of the artist and the expressive properties of color. Emil Nolde's nine-part *Life of Christ* altarpiece (1911–1912) combines Nolde's interest in the impact of color with a traditional Christian format. George Rouault, more than any other recognized twentieth-century artist, sought to create compelling Christian imagery. His 1926 *Miserere* series compares Christ's suffering with twentieth-century experiences of human sufferings in war. The work of Max Beckmann (d. 1950) equates the fall of Adam and Eve with the grotesque dimensions of the human condition under fascism. In contrast, the most popular and most often reproduced image of Jesus in the United States in the first half of the twentieth century was W. H. Sallmon's *Head of Christ* (1940), a sentimental, idealized figure with widespread influence.

Fantasy painters such as Salvador Dalí and Marc Chagall used Christian subject matter in a unique manner in order to suggest visions of the mind or vistas of a dreamworld fashioned out of the subconscious. Paintings such as Dalí's *Sacrament of the Last Supper* (1955) and Chagall's *White Crucifixion* (1938) identify a private vision in which traditional Christian iconography is reinterpreted. Pablo Picasso's *Guernica* (1937) has been interpreted as Christian iconography because some traditional imagery appears to enhance its reference to human terror and death, and because it suggests religious meanings. Abstract art in the twentieth century created the possibility for a broadly Christian iconography without recognizable subject matter. For instance, the purely abstract compositions of Piet Mondrian (d. 1944) were intended to provide an image of universal truths, religious in nature, that reflected theosophical beliefs.

Radical individuality and sociopolitical realities influenced the content of Christian iconography in the twentieth century. Revolutionary movements produced Christian iconography that placed traditional religious figures in advocacy relationships with human beings suffering social and political injustice. In predominantly Communist countries, socialist realism that emphasized the heroic stature of the worker or the revolutionary fighter replaced Christian iconography. In other cultures, indigenous forms were integrated into Christian imagery. African sculpture, South American painting, and Asian graphics, for example, often provided indigenous twentieth-century iconography. One aspect of the Christian ecumenical movement around the world was to encourage the diverse international community to reclaim and clarify their cultural heritages. Liturgical arts and iconography in non-Western cultures emphasized their individual locales and traditions.

Following the lead of religious leaders such as the Dominican artist-priest M. A. Couturier (1905–1957) from France, who encouraged abstract and modern artistic treatment of Christian themes, various modern artists entered the

arena of religious art. In France, Henri Matisse's windows and wall drawings at Vence, from the late 1940s; Le Corbusier's chapel at Ronchamp (1950–1955); and the stained glass, tapestries, and altar cloth of Fernand Léger at Audincourt (1951) all present Christian iconography in specifically twentieth-century forms.

In the United States, the work of the abstract expressionists from the early 1950s to the 1970s summarized much of the religious consciousness that had been expressed in modern art during the first half of the century by various abstract and expressionist movements. In works such as Robert Motherwell's *Reconciliation Elegy* (1962), Mark Rothko's chapel in Houston, Texas (1970), or Barnett Newman's *Stations of the Cross* (1958–1962), religious subject matter seems identical with expressions of radical individuality.

The twentieth century also saw the emergence of Christian iconography in new media, notably film and electronic communications. Biblical stories presented in films with such titles as *The Bible*, *The Ten Commandments*, *The King of Kings*, and *The Gospel according to St. Matthew* engaged a public separate from the church. The mass media, which now included home video, offered traditional Christian subject matter in extended narrative form as dramatic entertainment. In 2004 the film entitled *The Passion of the Christ* drew worldwide attention. Such presentations of Christian stories are a form of Christian iconography, but in their cultural context they appear to be no more than stories from one literary source among many, iconography for entertainment rather than worship.

CONCLUSION. The function of Christian iconography has varied in each generation. It has always been a living language of images invented by the religious consciousness of communities and individuals. Until the modern era, the figures of Jesus and his followers were always central to iconographic programs, but during the twentieth century the focus shifted to the individual iconographer on the one hand and to major cultural presentations of the stories on the other. At the end of the twentieth century and the beginning of the twenty-first century, individual parishes, independent religious communities, and various national responses have introduced their own Christian themes to the iconographic vocabulary. For instance, the so-called African experience or Asian experience have been given renewed attention through their arts.

Religious art continues to be affected to some extent by political and social forces. Censorship efforts on the part of religious communities have attracted headlines, but these efforts have not been effective in the general public. Pornography has been attacked for religious reasons but remains a major media industry. Antireligious attitudes have caused small episodes of outrage, but in the end the art world has not been seriously affected.

Within the large variety of Christian communities around the world, expanded interest in iconographic imagery

has produced a wealth of artistic activity. Nevertheless, the proliferation of art in the Christian church has not become a major factor in the art markets of the world. Leading collectors of Christian art, for instance, have not been identified, and museums do not offer major collections of Christian art unless it has some other value than just being religious.

However, interest in religions, generally, has risen in the twenty-first century for political reasons, and interest in religious art and architecture has increased accordingly. It may be that the academy and the general public will become more interested in the arts of world religions in the near future because religion has become a central theme. Other factors leading toward a larger role for religious art are the expanding place of museums in society and the relaxation of the traditional split, in the United States at least, between church and state.

Another tendency that is emerging in the twenty-first century has to do with the way various distinctive cultures in the world have artists who are reinterpreting the Christian biblical stories in their own cultural vernacular. Earlier efforts that translated the biblical story into the major languages of the world have led artists to apply traditional Christian iconographic themes to a variety of modern cultural settings. Such works of art also remind observers that the same was true when Christian iconography was first invented and emerged within the context of the Roman Empire. Cultural settings have always shaped Christian iconography and will continue to do so.

BIBLIOGRAPHY

- Bottari, Stefano. *Tesori d'arte cristiana*. 5 vols. Bologna, Italy, 1956–1968. Excellent photo-essays on major architectural monuments and their contents from early Christian times to the twentieth century. The principles of selection, however, are not clear, and the views printed are sometimes eccentric. Many color illustrations and ground plans.
- Cabrol, Fernand, et al., eds. *Dictionnaire d'archéologie chrétienne et de liturgie*. 15 vols. Paris, 1909–1953. Essential material for the history of Christian iconography, architecture, and worship. Illustrations, although small in size and few in number, include good ground plans. A classic research and reference source.
- Didron, Adolphe Napoléon. *Christian Iconography, or, The History of Christian Art in the Middle Ages* (1851–1886). 2 vols. Translated by Ellen J. Millington. New York, 1965. Organized thematically, with each essay treating historical sources in depth. Limited illustrations but valuable for theories concerning iconography.
- Ferguson, George. *Signs and Symbols in Christian Art* (1954). New York, 1961. Remains the most reliable single-volume handbook on the subject.
- Hall, James. *Dictionary of Subjects and Symbols in Art* (1974). Rev. ed. New York, 1979. Includes Christian subject matter.

Kirschbaum, Englebert, and Wolfgang Braunfels, eds. *Lexikon der christlichen Ikonographie*. 8 vols. Rome, 1968–1976. Vols. 1–4, *Allgemeine Ikonographie*, edited by Kirschbaum, present general articles on Christian iconography, alphabetically arranged; vols. 5–8, *Ikonographie der Heiligen*, edited by Braunfels, present the legends of the saints and their imagery in a separate alphabetical sequence. Both series of volumes include excellent bibliographies and summaries. Illustrations are relatively few in number and small in size.

Réau, Louis. *Iconographie de l'art chrétien*. 3 vols. in 6. Paris, 1955–1959. Includes a historical overview (vol. 1), Old and New Testament iconography (vol. 2), and an iconography of the saints with legends and cult status (vol. 3). Very few illustrations.

Schiller, Gertrud. *Ikonographie der christlichen Kunst*. 4 vols. in 5. Gütersloh, Germany, 1966–1976. Offers excellent essay introductions to Christian themes in art and their sources, covering presentations of Christ (vols. 1–3), the church (vol. 4, pt. 1), and Mary (vol. 4, pt. 2). An exemplary study with many well-selected and clearly printed illustrations. The first two volumes have been translated by Janet Seligman as *The Iconography of Christian Art*, vol. 1, *The Incarnation and Life of Christ* (Boston, 1971); and vol. 2, *The Passion of Christ* (Boston, 1972).

Suger, Abbot. *On the Abbey Church of St. Denis and Its Art Treasures*. Edited and translated by Erwin Panofsky. 2d ed. Princeton, N.J., 1979.

JOHN W. COOK (1987 AND 2005)

ICONOGRAPHY: ISLAMIC ICONOGRAPHY

Islam is generally considered an iconoclastic religion in which the representation of living things has been prohibited from its very beginning. However, the Qurʾān nowhere deals with this problem or explicitly speaks against representation. Rather, the prohibition of pictorial activities was derived from certain *ḥadīth*, the traditions attributed to the prophet Muḥammad and his followers. It has often been argued that the development of figural painting in Iran was due to Iran's Shīʿī persuasion, which would have taken these *ḥadīth* less seriously, but this idea likewise is not in keeping with historical fact, because the Shīʿīs follow the tradition as strictly as the Sunnīs, and furthermore, Shiism was declared Iran's state religion only in 1501.

Islam's attitude toward representation is basically in tune with the stark monotheistic doctrine that there is no creator but God: To produce a likeness of anything might be interpreted as an illicit arrogation of the divine creative power by humans. Such an attitude may have hardened at the time of the Byzantine Iconoclastic Controversy; thus, in Persian poetical parlance, “pictures” are often connected with (Christian) “convents.” Furthermore, the Islamic prohibition may have first been concerned primarily with sculpture, for sculptures—as they existed in the Kaʿbah in Mecca in pre-Islamic times—could lead humankind again into idolatry, and, indeed, hardly any sculptural art developed in Islam until recently.

EMERGING IMAGERY. The feeling that representation was alien to the original spirit of Islam resulted in the development of abstract ornamental design, both geometric and vegetal, notably the arabesque as the endless continuation of leaves, palmettes, and sometimes animal-like motifs growing out of each other; it also gave calligraphy its central place in Islamic art. However, it would be wrong to claim that early Islam was without any pictures. In secular buildings such as palaces, there was no lack of representations of kings, musicians, dancers, and the like, and expressions in Persian poetry such as “like a lion painted in the bathhouse” point to the existence of wall painting (albeit with the additional, negative meaning of “something lifeless”). Decorative painting on ceramics includes not only more or less stylized animal or human figures as individual motifs but also scenes from (often unidentified) tales and romances. Although the Arabic and Persian texts scribbled around the rims of the vessels sometimes give a clue to the scene, little is known about such pictorial programs, which are found on metalwork as well. Theories about pre-Islamic (Sassanid or Turkic) or astronomical symbolism have been proposed. In the early Middle Ages, certain Arabic books were illustrated either for practical purposes, namely medical and scientific manuscripts, or for entertainment, as in the *Maqāmāt* (Assemblies) of al-Ḥarīrī or the animal fables known as *Kalīlah wa-Dimnah*.

New stylistic features came with the growing Chinese influence during the Mongol occupation of Iran in the late thirteenth century. (Persian literature speaks of China as the “picture house,” where Mani, the founder of Manichaeism, acts as the master painter.) Henceforward, illustrative painting developed predominantly in Iran, where the great epic poems (an art form unknown to the Arabs) inspired miniaturists through the centuries to the extent that the iconography of Firdawsī’s *Shāh-nāmāh* (Book of kings) and Niẓāmī’s *Khamsah* (Quintet) became almost standardized. Early historical works, such as the world history of Rashīd al-Dīn (d. 1317), were rather realistically illustrated. Human faces are clearly shown (and later sometimes mutilated by orthodox critics), and even the prophet Muḥammad appears with his face uncovered.

The same originally held true for a branch of painting that has continued from the fourteenth century to the present day, namely, pictures of the Prophet’s night journey (*isrāʾ*, *miʾrāj*) through the heavens on the mysterious steed Burāq. In the course of time, Muḥammad’s face was covered partly, then completely; at present, no representation of the Prophet is permitted at all: In the numerous popular pictures of the Miʾrāj, he is represented by a white rose or a cloud. Burāq, meanwhile, has become a centerpiece of popular iconography: Pictures of this winged, donkey-shaped creature with a woman’s head and a peacock’s tail not only appear today on cheap prints but are also painted on trucks and buses, especially in Afghanistan and Pakistan, as a kind of protective charm.

Truck painting in these areas has developed into a new art form, and the religious and political ideals of the owners

become visible in the pictorial and calligraphic decorations of their vehicles. Similarly telling are wall paintings in Turkish or Afghan coffee- or teahouses, where one may find realistic scenes from the *Qiṣaṣ al-anbiyāʾ* (Stories of the prophets) or allusions to folk romances.

There was and is apparently no aversion to representing angels in Miʾrāj scenes, romances, or works on cosmology, or else as single figures, even in relief on walls. Their faces are always uncovered. Gabriel with his many enormous wings and Isrāfīl with the trumpet of resurrection are most prominent.

Islamic painting reached its zenith in Iran and India in the sixteenth and seventeenth centuries, when, partly under the influence of European prints, naturalistic portraiture was developed to perfection. The Mughal emperor Jahāmgīr (r. 1605–1627) inspired the court painters to express his dreams of spiritual world-rule in his portraits by using the motif of the lion and the lamb lying together, or by showing him in the company of Ṣūfīs.

THE SHAPE OF SPIRITUALITY. Portraits of Ṣūfīs and dervishes are frequent in the later Middle Ages: Many drawings capture the spiritual power or the refinement of a solitary Muslim holy man or illustrate the “sessions of the mystical lovers” (*majālīs al-ʿushshāq*). Ṣūfīs are also shown as teachers or in their whirling dance. However, little has been done to identify them, although the color of their garments (or the shape of their headgear) sometimes betrays their affiliation with a certain Ṣūfī order (thus, a cinnamon- or rose-colored frock is typical of the Ṣābirī branch of the Chishtīyah). Colors are also used to indicate the spiritual state the mystic has reached.

Manuscripts of the Qurʾān and *ḥadīths* were never illustrated but were written in beautiful calligraphy that sometimes assumes an almost “iconic” quality, as Martin Lings has pointed out. Qurʾanic themes, however, as retold in the stories of the prophets or in poetry such as the *Yūsuf and Zulaykhā* by Jāmī (d. 1492), have developed a pictorial tradition of their own. Some mystical epics, especially Aṭṭār’s *Mantiq al-ṭayr* (The conversation of the birds), have inspired painters, but the few examples of Rūmī’s *Mathnavī* with pictures, which date from fourteenth-century India to nineteenth-century Iran, lack any trace of Ṣūfī spirituality.

Sometimes seemingly simple motifs are interpreted mystically; this author’s Turkish Ṣūfī friends explain the frequent use of tulips on the tiles in Turkish mosques with the fact that the word *lālah* (“tulip”) has the same letters and thus the same numerical value as the word *Allāh*, that is, sixty-six. This is also true for the word *hilāl*, “crescent,” and the *hilāl* has come to be regarded as the typical sign of Islam although its first appearance on early Islamic coins, metalwork, and ceramics had no religious connotations. It seems that in the eleventh century, when some churches (such as Ani in Armenia) were converted into mosques, their cross-shaped finials were replaced with crescent-shaped ones. A *ḥājī*

(“pilgrimage”) certificate of 1432 shows drawings of the sacred buildings in Mecca with such crescent finials. The Ottoman sultan Selim I (r. 1512–1520) used the *hilāl* on his flag, but only in the early nineteenth century was it made the official Turkish emblem, which appeared on postage stamps in 1863. Other Muslim countries followed the Turkish example, and now it is generally seen as the Islamic equivalent of the Christian cross (thus, the Red Crescent parallels the Red Cross).

There was no inhibition in representing pilgrimage sites in medieval guidebooks for pilgrims. In the late nineteenth century, photographs of the holy cities of Mecca and Medina became prized possessions of pilgrims and of those who were unable to perform the *ḥajj*, just as many Muslim homes now contain prints, posters, or wall hangings with representations of the Ka‘bah and/or the Prophet’s mausoleum.

While naturalistic representation of the Prophet and his family was increasingly objected to, other ways of presenting him developed. One might put a *ḥadīth* in superb calligraphy on a single page or write his *ḥilyah*, an elaboration of the classical Arabic description of his outward and inward beauty, in a special calligraphic style, as was done in Turkey from about 1600. The Prophet’s footprints on stone, or representations of them, along with more or less elaborate drawings of his sandals, still belong to the generally accepted items in the religious tradition. One could also produce “pictures” of saintly persons such as ‘Alī ibn Abī Ṭālib from pious sentences written in minute script (although in Iran quite realistic battle scenes showing the bravery and suffering of Ḥusayn and other members of the Prophet’s family are also found in more recent times).

Calligraphic images have become more and more popular: The letters of the word *bismillāh* (“in the name of God”) can be shaped into birds and beasts; Qur’anic passages of particular protective importance, such as the “throne verse” (*sūrah* 2:256), appear in animal shape; and whenever a calligraphic lion is found, it usually consists of a formula connected with ‘Alī, who is called the “Lion of God” (Asad Allāh, Ḥaydar, Shir, and so forth). Most frequently used is the invocation “Nādī ‘Alīyan . . .” (“Call ‘Alī, who manifests wondrous things . . .”), which appears on many objects from Safavid Iran and Shī‘ī India, as do the names of the twelve Shī‘ī *imāms*. The names of the Panjtan (Muḥammad, ‘Alī, Fāṭimah, Ḥasan, and Ḥusayn) combined with the word *Allāh* are used to form human faces, as in the Bektāshī tradition in Turkey. The names of protective saints such as the Seven Sleepers (*sūrah* 18) are also used as a calligraphic design (but their figures appear as well in Persian and Turkish painting, with their faithful dog Qiṭmīr or his name always in the center). Invocations of Ṣūfī saints may be written in the shape of a dervish cap (typical is that of Mawlānā Rūmī); other pious exclamations appear as flowers or are arranged in circular form.

Indeed, the most typical and certainly the most widely used means of conveying the Islamic message was and still

is calligraphy. The walls of Persian mosques are covered with radiant tiles on which the names of God, Muḥammad, and ‘Alī in the square Kufic script give witness to the Shī‘ī form of faith; Turkish mosques are decorated with Qur’anic quotations or with an enormous *Allāh*. In Turkey, various calligrams are based on the letter *w*, and the central statements of the faith are written in mirrored form.

Lately, under European influence, a very colorful popular iconography has developed in some parts of the Muslim world. On posters, religious motifs from various traditions are strung together in highly surprising form: Raphael’s little angels appear along with the Lourdes Madonna around a deceased Muslim leader in a lush Paradise, or an apotheosis of Ayatollah Khomeini is coupled with the earthbound figure from Andrew Wyeth’s *Christina’s World*. (Here one is reminded of some pictures in the Indian Ismā‘īlī tradition that show ‘Alī as the tenth *avatāra* in the blue color of Kṛṣṇa, with Hanuman the “monkey-chief” carrying the royal umbrella over ‘Alī’s white mule, Duldul.) Such syncretistic pictures are certainly not acceptable to the large majority of pious Muslims. On the other hand, the calligraphic traditions are gaining new importance from Morocco to Indonesia, and some attempts at producing a kind of Qur’anic scriptorial picture (thus Sadiqain and Aslam Kamal in Pakistan) are remarkably successful and deserve the attention of the historian of religion and the art lover.

BIBLIOGRAPHY

Most histories of Islamic art deal with the topic of so-called iconoclasm in Islam. One of the latest publications is Mazhar Şevket Ipşiroğlu’s *Das Bild im Islam: Ein Verbot und seine Folgen* (Vienna, 1971), which stresses the Ṣūfī influence on Islamic painting but is not completely convincing. The only scholar who has devoted a good number of studies to Islamic iconography is Richard Ettinghausen; out of his many valuable works I shall mention especially “Hilāl in Islamic Art,” in *The Encyclopaedia of Islam*, new ed. (Leiden, 1960–), with a thorough historical survey; “Persian Ascension Miniatures of the Fourteenth Century,” in *Oriente ed occidente nel medio evo* (Rome, 1957), which treats the early pictorial development of the ascension theme; and his religious interpretation of a Mughal painting of Jahāmgīr preferring a Ṣūfī to worldly rulers, “The Emperor’s Choice,” in *De Artibus Opuscula XL: Essays in Honor of Erwin Panofsky*, edited by Millard Meiss (New York, 1961), vol. 1. See also Ettinghausen’s *Islamic Art and Archaeology: Collected Papers*, prepared and edited by Myriam Rosen-Ayalon (Berlin, 1984). The volume dedicated to Ettinghausen, *Studies in Art and Literature of the Near East*, edited by Peter Chelkowski (Salt Lake City, 1974), lists more of his relevant works and contains some articles pertinent to the problem of iconography.

The best pictorial introduction to the *mi‘rāj* miniatures is *The Miraculous Journey of Mahomet*, edited by Marie-Rose Séguy (London, 1977), based on a Uighur manuscript from the Timurid court at Herat. Popular painting has been dealt with

in Malik Aksel's *Türklerde dini resimler* (Istanbul, 1967), a delightful book with many examples of folk painting and calligraphic pictures from the Bektāshī tradition. A very useful introduction into Islamic iconography in Africa (a much neglected topic) is René A. Bravmann's *African Islam* (London, 1983). The calligraphic and iconographic aspects of the Qur'ān are lucidly explained in Martin Ling's *The Quranic Art of Calligraphy and Illumination* (London, 1976). A general survey of the calligraphic tradition in connection with the mystical and poetical expressions can be found in my *Calligraphy and Islamic Culture* (New York, 1984).

ANNEMARIE SCHIMMEL (1987)

ICONS. The term *icon* (from the Greek *eikōn*, "image") is applied in a broad sense to all sacred images worshiped by Christians in eastern Europe and the Middle East regardless of the image's media; thus icons may be mosaics, frescoes, engravings on marble or metal, or prints on paper. In its current use the term describes portable sacred images painted on wood, canvas, or glass.

BEGINNING AND GROWTH OF THE VENERATION OF ICONS. Portable icons first appeared in Egypt in the third century. The oldest works that have been preserved to this day bear a striking resemblance to the funeral portraits that replaced the masks on the anthropoid coffins of the Hellenistic period. The Judaic tradition, which relied on the biblical prohibition of the use of images in religious worship, was confronted in the eastern Mediterranean area with the Greek tradition, theoretically substantiated by Neoplatonism, according to which the material symbol is an expression of spiritual reality and the image has a didactic function. This latter tradition gained ground even in some Jewish communities; for example, frescoes based on biblical subjects were painted on the walls of the synagogue at Dura-Europos (present-day Salahiyyeh, Syria) in the third century. It was the Greek tradition that caused the emergence as early as the second and third centuries of sacred imagery in the Christian church, which had originally used only symbols (e.g., the cross, lamb, fish, and dove). The didactic function of images was generally accepted throughout the Christian world, but the veneration of images did not spread to all areas: It remained a specific cult of Christianity in the Greco-Byzantine tradition.

The earliest icons, like the Hellenistic funeral portraits, originally had a commemorative value: They were representations of martyrs, apostles, the Virgin, and Jesus Christ. As early as the fourth century a typology of characters took shape, and their sacred nature was marked by a nimbus. The authenticity of portraits was an essential concern: The images of Christ and the Virgin were believed to be of miraculous origin, "made without hands" (Gr., *acheiropoiētos*); those of the saints were rendered according to descriptions preserved by traditional—oral or written—sources. The oldest icon representing the Virgin originated in Palestine and, with the exception of the visage, was attributed to the apostle Luke; the visage was said to have been painted miraculously, with-

out the touch of the human hand. According to tradition, the representation of Christ relied on a portrait Jesus had sent to the king of Edessa, Abgar Ukkama, "the black" (d. 50 CE), and on the veil of Veronica, said to bear the imprint of the Savior's face (recent research suggests that the name Veronica derives from the Latin *vera icona*, "true face").

As Christian icon painting developed after the fourth century, themes relating to the historical cycles of Christ's mission (miracles, scenes from his life) and then events from the lives of saints and from the history of the Christian church were introduced. In the sixth century icon worship spread throughout the Byzantine Empire. Icons were displayed to the faithful in churches or during processions, and they were also to be found in private homes. They were either in one piece or were combined from two or three pieces, forming, respectively, diptychs and triptychs. The strength of the development of icon worship, the miraculous powers attributed to certain icons, and the fact that in the minds of the faithful icons were identified with the character they represented, aroused, even from the beginning, opposition and hostility from some of the fathers of the church. This led in the eighth century to the iconoclastic crisis, which resulted in the destruction of a large number of icons, especially in areas under the direct authority of the Byzantine emperors. Nevertheless iconoclasm was unable to prevent the further development of icon worship at the periphery of the empire; hence the oldest icons, dating from the fifth and sixth centuries, were preserved in Georgia (Transcaucasia), on Mount Sinai, and in Cyprus. With the official restoration of the veneration of icons in 843, the practice of veneration became generalized not only in the Byzantine Empire but also in other regions where the Eastern Orthodox church had become predominant, such as the Balkan Peninsula and Russia.

Following the triumph of the doctrine claiming the legitimacy of icon worship many more wall icons were displayed in sanctuaries, and the iconostasis (Gr., *eikonostasis*, "support for icons") was introduced, a screen of icons that separated the altar from the nave of the church. The iconostasis apparently developed from the *templon*, a barrier made of stone, marble, or ivory that enclosed the main apse or chancel, where the sacred table was contained.

THEOLOGY OF ICONS. The final elaboration of the theology of icons resulted from the disputes caused by iconoclasm and the rules formulated by the Second Council of Nicaea (787). The earliest elements of the doctrine had already been enunciated in the second to the fourth centuries. Arguing against the Christian apologists who condemned idols as "devilish," such Neoplatonic thinkers as Celsus (latter half of the second century), Porphyry (c. 234–c. 305), and Emperor Julian the Apostate (d. 363) attempted to give a metaphysical justification of sacred images and statues as material symbols expressing external and spiritual realities and fulfilling at the same time a significant didactic function. According to Neoplatonists the relationship between image and prototype is not

one of sameness: Images serve only as vehicles by which to approach the divine prototype, which is hidden from humans because of the limitations of their corporeality. The arguments adduced by the Neoplatonists are to be found in subsequent developments of Christian theology. Thus, the concept according to which “sensible images are vehicles whereby we accede, as far as possible, to divine contemplation” was clearly stated by Dionysius the Areopagite (c. 500) in his treatise *Ecclesiastical Hierarchy* (1.2). The relationship between image and its divine prototype would be later clarified in the same vein in the writings of John of Damascus (c. 679–749) and other authors of the Eastern church.

The Christian authors of the eighth and ninth centuries who formulated the theology of icons relied on a belief that icon worship was a consequence of the incarnation of the Son of God. According to Germanus I, patriarch of Constantinople (r. 715–730), the Son could be portrayed because he “consented to become a man.” An icon representing Christ is not an image of the “incomprehensible and immortal Deity” but rather that of the “human character” of the Logos (the Word) and serves as proof that “indeed he became a man in all respects, except for sin.” Christ could be represented only “in his human form, in his visible theophany.” John of Damascus, who wrote three treatises in defense of “sacred icons,” gave the following definition of the painted image of the Deity: “I represent God the Invisible not as invisible but to the extent he became visible to us by partaking of flesh and blood.”

John of Damascus and, especially, Theodore of Studios (759–826) and Nikephoros, patriarch of Constantinople (r. 806–815), further clarified the relationship between the sacred image, or icon, and its divine prototype. To them image is essentially distinct from the original: It is an object of relative veneration (Gr., *proskunēsis skhetikē*). Through the meditation of the icon the faithful actually address the prototype it represents, and so the relative veneration of the image becomes adoration (Gr., *latreia*) that is exclusively offered to the Deity. This distinction between adoration of the model and relative veneration of its image removed the danger of turning icons into fetishes, a danger that was inherent in their worship. Theodore of Studios emphasized that “veneration was not due to the essence of the image but rather to the form of the Prototype represented by the image . . . since matter cannot be subject to veneration.”

These clarifications stressed the intimate connection between the theology of icons and the Christological question posed by the heresy of docetism, which questioned the real humanity of Christ and claimed that Christ’s body was only apparent. In contradistinction, the icon was claimed to represent the image of an incarnation of the Son of God, thus, according to Germanus, “proving that he invested our nature by means other than imagination.” Indescribable by his divine nature, Christ is describable by the complete reality of his historical humanity.

According to Theodore of Studios, “the fact that God made man after his likeness showed that icon painting was an act of God.” The theology of icons confers upon icons an almost sacramental role. As the early painters saw it, their art did not belong to aesthetics but rather to liturgy. The perfection of form was no more than an adequate expression of the doctrine. The painter was not an artist in the modern sense of the word but a priest: His talent was a necessary, but not sufficient, condition. He was chosen and guided by a master; the beginning of his apprenticeship was marked by a ritual (e.g., prayer and benediction) quite similar to that of an initiation.

The earliest painters of icons never signed their works because their individuality was believed to be of no consequence. (The first icons to be signed, in the fifteenth and sixteenth centuries, signaled the beginning of decadence in the art of icon making.) Seen as mere interpreters of the truth, the painters of old had to follow strict rules: The subjects of their paintings could only be previously established models, scenes from the holy books, or, more rarely, acknowledged visions; they did their work after having fasted and received the Eucharist; and some even mixed holy water with their colors.

DIFFUSION OF THE CULT OF ICONS. After the conclusion of the iconoclastic crisis, icon painting in Byzantium, under the Palaeologus dynasty (1261–1453), witnessed a remarkable period in which artistic perfection was reached; that style further influenced the art of icon making down to the present time. In the Greek territories the main icon-producing centers were Mount Athos and the imperial workshops in Constantinople, Thessalonica, and, after the fall of Byzantium, Crete. Cretan painters, having remained outside the area of Ottoman domination between 1453 and 1669, produced a great many works that were disseminated throughout the Orthodox world. Their icons displayed a certain lavishness, to be explained by the comfortable conditions in which they were produced; they were increasingly influenced by the contemporary Italian painting not only in the rendering of human visages and bodies, and of space, but even in iconography.

In eastern and southeastern Europe the cult of icons was disseminated by the early missionaries and through contacts with Byzantium. At first icons were brought from the Byzantine territories, but later they began to be produced in local workshops: at Preslav and Veliko Tŭrnovo in Bulgaria; at the courts of Serbian kings and Romanian princes; in Walachia and Moldavia; and in major monasteries in all these countries. They were characterized by their faithfulness to the Byzantine prototypes, but starting in the eighteenth century, popular local tastes made an impact on the choice of colors, the design of costumes, and the decoration of space. The union of a part of the Eastern Orthodox Romanians in Transylvania with the church of Rome gave rise to a unique phenomenon in Eastern Christian art: Icons were painted on glass by peasant artists, producing works that strongly resembled naive folk painting.

Of the oldest icons imported to Russia after the baptizing of the Russians in 988, only works of Byzantine origin dating from the eleventh century have been preserved. In the same century the earliest local icon-making centers began to emerge, first in Kiev and then in Novgorod and Vladimir-Suzdal. The earliest masters were from Byzantium, but soon a specific Russian style took shape; it developed from a spiritualized and ascetic attitude to a search for artistic and didactic effects, a taste for minute detail, and naturalism. The Council of the Hundred Chapters held in Moscow in 1551 reacted against the penetration of Western elements into the art of icon painting and put down rigid, mandatory rules to be followed by painters. This led to a proliferation of handbooks that provided authorized versions (Ch. Slav., *podliniki*, "outlines") of the holy images; these guides were equivalent to the ones used in the Byzantine Empire beginning in the eleventh century. The reforms enacted by Peter the Great (r. 1682–1725) inhibited the further development of icon painting, and the art subsequently lapsed into conservatism.

In the East after the Council of Chalcedon (451), the church (under the patriarchates of Antioch and Jerusalem) followed the orthodox doctrine upheld against Monophysitism. In the seventeenth century the style of icon painting known as Melchite developed under new influences—Arabic, in terms of decoration; western European, in terms of subject matter.

BIBLIOGRAPHY

The scientific study of icons began in the latter half of the nineteenth century as part of the new discipline of Byzantology and enlisted especially Russian contributions; an essential bibliography is to be found in Oskar Wulff and Michael Alpatoff's *Denkmäler der Ikonmalerei* (Leipzig, 1925), pp. 298–299. Earlier research included icons, described as "panel paintings" or "portable images," in studies on Eastern Christian iconography, among which the fundamental work remains Gabriel Millet's *Recherches sur l'iconographie de l'Évangile aux quatorzième, quinzième, et seizième siècles* (Paris, 1916). In western Europe and America icons were "discovered" as works of art and spiritual creations only after World War I, when the Christian Orthodox tradition was reassessed by Catholic and Protestant scholars; see David Talbot Rice's *Byzantine Art*, 2d ed., rev. & enl. (Baltimore, 1968). Most experts approach icons as works of art within the general framework of Byzantine or, particularly, Russian art—for example, André Grabar's *Byzantine Painting*, translated by Stuart Gilbert (New York, 1953), and Tamara Talbot Rice's *Icons*, rev. ed. (London, 1960). The theology of icons has been systematically studied and clarified mainly by Western Orthodox authors since the 1950s; the most profound works are Leonid Ouspensky and Vladimir Lossky's *The Meaning of Icons*, translated by G. E. H. Palmer and Eugénie Kadloubovsky, rev. ed. (Crestwood, N.Y., 1982); and Leonid Ouspensky's *Essai sur la théologie de l'icône dans l'église orthodoxe* (Paris, 1960). Most writings about Eastern Orthodox Christianity contain pertinent chapters on icons:

Timothy Ware's *The Orthodox Church*, rev. ed. (Baltimore, 1964); Paul Evdokimoff's *L'orthodoxie* (Paris, 1959); and John Meyendorff's *Byzantine Theology: Historical Trends and Doctrinal Themes* (New York, 1979). Photographs of the oldest, fifth- to sixth-century, icons have been published in Georgios A. Sotiriou and Maria Sotiriou's *Icones du Mont Sinai/Eikonec the Monha Cina* (in Greek and French), vols. 1 and 2 (Athens, 1956–1958). New information about the role of icons during the posticonoclastic period is to be found in Manoles Chatzedakes's "L'évolution de l'icône aux onzième à treizième siècles et la transformation du templon," and Tania Velmans's "Rayonnement de l'icône à l'onzième siècle," in *Actes du quinzième Congrès international d'études byzantines*, vol. 1 (Athens, 1979), pp. 333–366, 375–419. For icons of the Middle East, see Sylvia Agémian's important study in my collection titled *Les icones melkites* (Beirut, 1969).

VIRGIL CÂNDEA (1987)

Translated from Romanian by Sergiu Celac
Revised Bibliography

IDEALISM. Idealism is the metaphysical view that reality is of the nature of mind. It stands in contrast with scientific philosophies, such as naturalism, realism, and pragmatism that assume that natural life in the natural world is philosophy's appropriate point of departure. Idealism is not grounded in an empirical evaluation of fact. It is grounded in an intuitive evaluation of meaning. Because all philosophy presupposes that things have a meaning and that something, at least, of that meaning can be known, all philosophy has an idealistic element.

Idealism does not deny the reality of the physical world. It insists only that the apparent self-sufficiency of the natural world is deceptive. Nature seems to go its own way, to be

self-sufficient, eternal, and operating on the basis of its own laws without need of a creator or outside force to initiate and sustain its motions, but idealism maintains that it relies on mind or spirit or idea for its forcefulness, purposiveness, and inherent meaning. Idealism therefore always distinguishes between appearance and reality, but its emphasis can either be objective or subjective. Subjective idealism sees the physical world as metaphysically insubstantial. Objective idealism regards physical substance as a necessary counterpart of mind.

SUBJECTIVE IDEALISM. The doctrine of the world as *māyā* or illusion in Śaṅkara's Advaita Vedānta philosophy in India is the most systematic statement of subjective idealism, although George Berkeley's philosophy is the best-known statement of subjective idealism in the West. Berkeley observed that one's visual perception of the physical world is that of shapes and colors, not of any substantial "thing." People project "physical substance" into the picture because they assume that there must be some "thing" that "has" these perceived qualities.

All one ever knows, however, are the perceived qualities. Reality, therefore, is a perception on the part of a perceiver. Hence Berkeley's principle *esse est percipi* ("to be is to be perceived"). He pointed out that one seems to see distance; in fact, however, three-dimensional depth perception is a learned projection of the mind, not a physical reality that impinges directly on one's senses. He added that the physical sciences are not concerned with some "substantial" reality of a physical object, but rather with those perceptions known to mind. To test a yellow metal to see if it is gold, for example, the chemist does not test "substance," but properties—solubility in different acids, combining proportions, and weight. The "substance" of gold is only a fact of experience that these properties bring together. Berkeley concluded that the distinction between what Locke had called primary qualities and secondary qualities—real "substance" as opposed to "appearances" (of color, shape, etc.)—was mistaken. Nature is, he insisted, whole. If space is mental, then all the other qualities of the natural object must also be mental. Reality is entirely an observer's perception.

But what of objects that are alone and unobserved by any human knower, like the tree in the deserted forest or the living-room furniture in the dead of night? Berkeley argued that natural laws hold for events past as well as future because there is an eternal mind to think them. The living-room sofa exists as an object in the eternal perception of the mind of God. God alone guarantees the eternal endurance and order of nature.

The most consistent subjective idealist in modern Western philosophy was G. W. Leibniz, who held that each self is a "monad" of self-enclosed experience. He accepted a plurality of worlds—my world must be different from yours—and solipsism, the view that each person is *solus ipse*, a "windowless monad."

Here subjective idealism runs afoul of the "ego-centric predicament." Confined to his or her own ideas, the self-confessed solipsist nevertheless assumes that he or she knows what it might be like *not* to be so confined; otherwise the assertion has no significance. Each self is conscious, necessarily, of what it is not, in order to know itself as a distinct and separate entity. Solipsism, therefore, is self-refuting.

OBJECTIVE IDEALISM. Objective idealism, mindful of this pitfall, grants to naturalism that the physical world is given from "outside" one's self, and must be received passively, but agrees with subjective idealism that one's experience of this given world is, in large part, an interpretation shaped by one's own mind. Both subjective and objective idealism are rooted in the intuition that reality is essentially mind. Objective idealism is distinguished by a nondual view in which the physical world shares metaphysical reality.

The historic relation between idealistic philosophy and religious reflection stems from this common concern for showing how an immaterial power gives the material world its reality and true being. The idealistic commitment to mind as ultimately real expresses, in the language of experience, a view that overlaps the religious commitment to spirit as the enabling power of being. This tradition in Western philosophy was first explored systematically by Plato, for whom reality lay in the eternal forms, or ideas, that were the meaning of any particular thing. These particulars, however, were always imperfect because they were necessarily material. Matter, for Plato, is an admittedly indispensable context for existence. More significantly, however, it is a hindrance to realization of the true meaning of things, which is their ideal form. Plato is unclear as to why nature should exist, and matter remains a dark and unresolved dilemma in his philosophy. Aristotle gave matter greater status by making it the counterpart of form or idea in any particular. Matter is therefore the possibility of a new form. Mind or spirit or form shapes matter, as the idea of a pot in the mind of a potter transforms a lump of clay into a utensil for human use.

Plato and Aristotle incline toward idealism but remain dualists. It was only after Immanuel Kant that idealism offered an integrated view of reality that did justice to natural fact. Beginning with the radical distinction between mind and matter with which René Descartes had first fashioned the modern mind, idealists argued that mind and matter are different but interdependent. J. G. Fichte argued that will is the essence of mind, and will requires the recalcitrant opposition of material stuff in order for work to teach the moral lessons of industry, perseverance, and devotion to factual truth. For Fichte, nature is "the material for our duty, made sensible." For Friedrich Schelling and G. W. F. Hegel, nature is necessary in order that mind attain full self-awareness. Hegel argued that useful knowledge is always acquired through a double movement: first one gains an intimate knowledge of the particular thing, and then one learns something of what it is not. To know one's own language for what it truly is, for example, one must know something of a differ-

ent language. So, to generalize from that experience, mind must know something that is not mind. It must wander in an alien world before it can return home to know itself truly for the first time. Nature, therefore, is the “otherness of spirit,” the alien land in which the mind wanders in order to gain full possession of itself. Or, to put it less metaphorically, natural objects are the necessary content of mind. There is no thought without an object; one must think something. Whereas subjective idealism, in both the monadology of Leibniz and the Advaita Vedānta of Śaṅkara, argues that mind alone is the really real, objective idealism argues that objective nature is a necessary condition for the reality of mind. Reality is therefore not a univocal state; it is a dialectical process.

IDEALIST ETHICS. Idealism also proposes an ethics, developed from its metaphysical view that mind or spirit constitutes an eternal and purposive transcendent order. As the metaphysical reality of any particular is derived from the idea that is its ultimate meaning, so the norms and values of human behavior are derived from the transcendent idea of love, power, justice, or so forth.

Unlike modern naturalisms, which regard ethical values as entirely relative to the social and psychological needs of natural groups, idealism holds that there are what Kant called categorical imperatives, or moral absolutes. Kant stated the foundational principle of all idealistic ethics, people always should be treated as ends in themselves and never as a means to some end; but his dogmatic categorical imperative lacks metaphysical justification. It was his successors who developed an independent metaphysics that could flesh out Kant’s intuitive insight with a rational argument. Hegel supplemented the Kantian view with a dialectical interpretation of concrete freedom that seeks to ally itself with whatever is objectively rational and universal in the laws and institutions of one’s community. This view turned idealism toward social realism. Josiah Royce later argued that the objective reason that Hegel sought in institutions could not be found there if, as Hegel himself noted, institutions rise and fall. Rejecting Hegel’s conservatism, Royce argued that one’s loyalty is not just to the institutionalized rationality of the past but to the hoped-for rationality of the future. For Royce, therefore, one’s primary loyalty is not to institutions but to those creative causes that some institutions sometimes serve. There will be different interpretations as to what these causes should be, but the authentic common spirit of cause-servers everywhere will always be one of loyalty. Royce’s categorical imperative is therefore that one should be loyal to loyalty wherever it is found.

Various forms of idealism were influential during the nineteenth and early twentieth centuries when there was confidence in reason and hope for the future. The prevailing spirit since the late twentieth century has become skeptical of rationalization and pessimistic about the future, so idealistic philosophy is less influential. However, when religious thinkers look for a rational and universal language of experi-

ence in which to articulate the dramatic, poetic, and mythological convictions of the great religions with their message of a divine *Logos* that assures the ultimate fulfillment of a divine purpose, that language is inescapably some form of idealism.

BIBLIOGRAPHY

Plato’s dialogues all focus on the idealist issue, and Plotinus’s third-century *Enneads* bears resemblance to the Advaita Vedānta philosophy in India, which Śaṅkara articulates in his ninth-century *Commentary on the Brahma Sutra*. Kant’s *Religion within the Limits of Reason Alone* (1793), translated by Theodore M. Greene et al. (New York, 1960), identifies mind and spirit in idealistic fashion, and Hegel’s *Lectures on the Philosophy of Religion* (1832), 3 vols., translated by E. B. Speirs and J. B. Sanderson (London, 1895), is the first systematic statement of idealistic philosophy of religion in the West. Josiah Royce’s *The Problem of Christianity*, 2 vols. (New York, 1913), and William Ernest Hocking’s *The Meaning of God in Human Experience* (New Haven, Conn., 1912) are the best-known systematic statements in the American philosophical tradition.

The best secondary sources on idealism are in the major histories of Western philosophy. For a technical discussion of philosophical ideas and their development, Wilhelm Windelband’s *History of Philosophy*, translated by James H. Tufts (New York, 1893), is still unsurpassed. For idealism as an influential strand of modern intellectual culture, see John Herman Randall, Jr.’s *The Making of the Modern Mind* (New York, 1976) and Randall’s two-volume *The Career of Philosophy* (New York, 1962–1965), especially volume 2, *From the German Enlightenment to the Age of Darwin*. The most recent significant interpretation of a major religious tradition in the light of an idealistic philosophy is Paul Tillich’s three-volume *Systematic Theology* (Chicago, 1951–1963).

Revised Bibliography

IDOLATRY. The word *idolatry* is formed from two Greek words, *eidōlon*, “image,” and *latreia*, “adoration.” Etymologically, *idolatry* means “adoration of images.” Authors

have given *idolatry* and *idol* widely differing definitions thereby revealing the complexity of the problem. Eugène Goblet d'Alviella uses the term *idol* to mean images or statues "that are considered to be conscious and animate" and sees idolatry in the act of "regarding an image as a superhuman personality" (Goblet d'Alviella, 1911, p. 126). In a relatively recent article, J. Goetz (1962), trying to get a better grip on the problem, establishes, first, that in the wake of etymology idolatry "designates the adoration of images by emphasizing the specific nature of the cult surrounding the objects, a cult of adoration, which strictly speaking expresses a feeling of absolute dependence, especially through sacrifice." He then states that the terms *idolatry* and *idol* remain inaccurate, and that "the authors who have tackled the problem of idolatry most often defined the idol as an object in anthropomorphic form, intended to represent a spirit, the object of worship." Finally, venturing onto the terrain of religious phenomenology, he risks a definition of *idol*: "any material object that receives a form of worship more or less structured," idolatry being this form of worship.

The concept of idolatry originated in a very specific historico-religious context: the monotheism of Israel. Consequently, an authentic approach to the concept must refer to the Hebrew scriptures. In his research on the prophetic reaction to pagan religious concepts, Christopher R. North presents two ideas taken directly from the prophets. First, "Idolatry is the worship of the creature instead of the Creator and, to make matters worse, the creature is made by man, who is himself a creature" (North, 1958, p. 158). He then states: "Idolatry is the worship of what in modern terms we should call process, the 'life-force,' the *élan vital*, or what we will, instead of the Creator who transcends and is in some sort external to creation" (*ibid.*, p. 159). Finally, here is another, more recently formulated definition: "Idolatry may be defined as the worship of an idol (*eidōlon*, image, portrait) considered as a substitute for the divine" (M. Delahoutre, "Idolâtrie," *Dictionnaire des religions*, Paris, 1984).

This brief survey should help situate this article's discussion. The concept of idolatry originated in the application of the second commandment. It acquired definitive formulation in censure by the prophets of Israel of the pagan cults and their influence on the chosen people. This biblical heritage passed into the New Testament and early Christianity, blazing its way through the forest of pagan cults. The monotheism of Islam adopted this Judeo-Christian concept and made it one of the foundations of its beliefs and its faith.

Beginning with these notions formed with the help of the dogmatic thought as well as the polemic stance of the three great monotheisms, the historian of religions enlarges his vision of idolatry by studying this religious phenomenon through the behavior of *homo religiosus* in relation to the representation of divinity. However, this study becomes vast and includes other very important aspects: images for worship, symbolism in religions and cults, religious art, veneration of images, iconoclasm. The present study is limited to

idolatry, which it will approach on two levels: On the one hand, the historico-religious fact that the three great monotheisms censured the worship of idols; and, on the other hand, the phenomenon of humankind's attitude of worship in the presence of a visible representation of divinity. The study of these two aspects is made with reference to the historical documentation left by the *homo religiosus* concerned.

HISTORICAL SEMANTICS. In ancient Greek texts since Homer one rarely finds the word *eidōlon*. Formed from *eidōs* (n.), "aspect, shape," the word *eidōlon* has diverse meanings: "phantom, undetermined form, image reflected in a mirror or in water." It also means an image formed in the human mind. Thus in the ancient Greek world, *eidōlon* did not have a religious meaning.

One must therefore turn to the biblical Greek world, where *eidōlon* is found in the Septuagint. Used 70 times in the protocanonical texts, it translates 16 different Hebrew words, as for example *aven*, vanity; *elil*, nothing; *gillulim*, excrement; *pesel*, carved statue; *tselim*, image. For these protocanonical texts the Vulgate uses *idolum* 112 times and *simulacrum* 32 times in order to translate 15 Hebrew words. *Eidōlon* also appears many times in the apocryphal writings. The Hebrew Bible uses 30 different nouns in order to talk about idols and mentions 44 pagan divinities. Thus *eidōlon* designates the false gods and does so with a scornful nuance, for they are vanity, lies, nothingness, vain images, molded metal, carved wood. It is therefore through choices made by Greek translators of the Bible that *eidōlon* acquired the religious sense of representing a pagan divinity considered to be a false god. Thus the Septuagint gave *eidōlon* a new pejorative and polemical meaning. (By extension, *eidoleiōn* means a temple in which idols are found.)

Eidōlon passed into the Greek New Testament. The word does not occur in the Gospels, but it appears elsewhere (*Acts* 7:41, 15:20; *Rom.* 2:22; *1 Cor.* 8:4, 8:7, 10:9, 12:2; *2 Cor.* 6:16; *1 Thes.* 1:9; *1 Jn.* 5:21; *Rev.* 9:20). The Vulgate sometimes translates it as *idolum* and sometimes as *simulacrum*. One passage (*1 Cor.* 7:10) has the word *eidoleion*, "temple of idols," which the Vulgate preserves, Latinizing it as *idolium*. The New Testament passages show that in the eyes of the compilers, the pagan gods have no substance (*Gal.* 4:8). Behind their worship hides the work of demons (*1 Cor.* 10:19).

The word *eidōlon* passed into patristic terminology. Its usage is common from the second century on. In the *Epistle of Barnabas*, the *eidōla* are the pagan gods to which the Hebrews turned in the desert. Justin Martyr (*1 Apology* 64.1) designates as an *eidōlon* a statue of Kore, who was considered to be the daughter of Zeus. In speaking of pagan gods, Clement of Alexandria made use of all the richness of Greek vocabulary of his time. Evidence of this can be found in chapter 4 of the *Exhortation to the Heathen*, devoted to statues of gods, *agalmata*. He calls them idols (4.53.1) and includes them among the demons (4.55.1), which are impure and base spirits. He invites his readers to approach these statues

(*agalmata*) in order to uncover the error that they conceal: "Their exterior clearly shows the mark of your demons' inner dispositions" (4.57.1). Later he reproaches the Greeks for having given themselves models of sensuality in these idols (4.61.1). Justin proclaims that Christ came to liberate people from the domination of idols (*Dialogue with Trypho* 113.6). These pagan gods are only phantoms that take possession of the human spirit and give the pagans the illusion of divine worship (Athenagoras, *Libellus* 23). These few samples, taken from the arsenal of the polemic of the apologists and the Greek fathers, show how the meaning of *eidōlon* expanded in the Greek world during the first centuries of the common era.

The Latin fathers adopt the same vocabulary and an identical stance. Tertullian shows that the pagan gods have no substance (*Apologetics* 10.2); then he attacks the statues as inert matter, *simulacra* made of material related to that of vases and ordinary utensils (12.2). In a similar fashion, Firmicus Maternus speaks of the *imagines consecratas* of public pagan worship (*Octavius* 24.5). Augustine gives a definitive structure to this criticism of idolatry made by the Latin apologists. Speaking of the pagan gods, he shows the semantic relationship between *simulacrum* and *idolum*: "*simulacra*, which in Greek are called idols" (*Expositions on the Psalms* 135.3). In his eyes, the idol worshipers are *daemonicolae*. The idol lets the demon make his own revelation (Mandouze, 1958).

The words *eidōlolatRIA* and *eidōlolatrēs* are found neither in secular Greek texts nor in the Septuagint nor in the writings of Philo Judaeus. They are a specific contribution of the New Testament and Christian literature of the first Christian centuries. Paul considers idolatry a grave sin and puts it on the list of sins that Christians must avoid (*1 Cor.* 5:10–11, 6:9, 10:7, 10:14; *Gal.* 5:20; *Col.* 3:5; *Eph.* 5:5). The writer of *1 Peter* 4:3 speaks in analogous fashion of the worship of idols that ought to be rejected by Christians. The same idea appears in *Revelation* 21:8 and 22:15.

The use of the two words becomes constant in Greek patristic literature. Clement of Alexandria even leaves a definition of idolatry: "the extension to numerous divinities of what is reserved for the one true God" (*Miscellanies* 3.12). The Christian church opposed idols and condemned their manufacture. The second-century apologists left a veritable arsenal of arguments on which Christian polemicists would draw until the age of Augustine.

IDOLATRY AND THE HEBREW SCRIPTURES. The formal condemnation of idolatry is found in *Exodus* 20:3–5. The biblical God (whose unvocalized name is YHVH) simultaneously forbids the worship of foreign gods and the making of images that claim to represent him, because it is impossible to represent the God of Israel. A confirmation and amplification of this commandment are found in *Deuteronomy* 4:12–19. The interdiction pertains to both theriomorphic and anthropomorphic images. It pertains also to symbolic animal representations of the divinity. Thus idolatry is vested with a dou-

ble aspect: the idolatrous worship of Yahveh as well as the worship of false gods.

The Mosaic prohibition. The second commandment forbids the making of representations of the divinity (*Ex.* 20:4–6; *Dt.* 4:15–19 and 5:6–9; *Lv.* 26:1). A rigorous tendency took this Mosaic prohibition literally by banishing all ornamentation of religious buildings. This tendency, which became widespread among the Pharisees, insisted on the spiritualization of God and radically opposed the danger of idolatry. A more liberal tendency has always existed, however, as attested by the animal and human decoration of certain synagogues discovered by archaeologists.

Idolatrous worship of YHVH. Biblical texts refer to this worship on various occasions. The Hebrew tribes underwent the influence of Canaanite culture (*Jgs.* 3:5–6, *Dt.* 7:1–5). Micah of the tribe of Ephraim made a *pesel* and a *massekhabh*, a carved image and idol of cast metal (*Jgs.* 17:1–13), perhaps an image of God. After his victory over Midian, Gideon made use of the gold taken from the enemy to make and set up an *efod* (*Jgs.* 8:22–27). Moreover, there is evidence of the tauriform cult of YHVH in the northern kingdom of Israel after the schism of 935 (*1 Kgs.* 12:26–32, *2 Kgs.* 15:24). In *1 Kings* 12:28, Jeroboam presents God, symbolized by the bull (Hadad and Teshub, fertility gods), as the liberator of Israel at the time of the flight from Egypt. The writer of *2 Kings* 15:24 speaks of the erection of statues of divine bulls. This is the religious tradition of the golden calf.

The prophets fought the use of images because they represented the danger of superstition. *Hosea* 3:4 assails the stelae (*matstsebot*) erected next to the altars, the *efod*, which are either images or instruments for interrogating Yahveh, and the *terafim*, which closely resemble the *efod*. Thus, the prophet aims at the elimination of even the accessories to worship. Jeremiah went even further, proclaiming around 587 BCE that he would no longer speak of the Ark of the Covenant of Yahveh, which would be neither remembered nor missed, and which would never be built again (*Jer.* 3:16).

The prophetic argument is simple. It rejects all tangible representation of God as dangerous because the image is distinct from God. Hosea, moreover, refers to the past, to the youth of Israel, and to the flight from Egypt (*Hos.* 2:17). Thus, prophetic polemics find support in the Mosaic tradition. It is in this context that the incident of the golden calf (*Ex.* 32) must be understood and seen in terms of a protest against the worship of the tauriform Yahveh. Clearly, one is confronted here with a total rejection of the symbolism of the idol.

Idolatry as worship of false gods. The second aspect of idolatry holds a much larger place in the Bible; to understand it is necessary to review the history of idolatry in Israel. The ancestors of the chosen people practiced polytheism. Joshua recalled this in his address to the assembly at Shechem: The father of Abraham and Nahor served other gods (*Jos.* 24:2, 24:14), and even in Egypt some Hebrews wor-

shipped pagan divinities. Upon their return from Egypt, the seminomadic Hebrew tribes who settled in Canaan came under the influence of the surrounding pagan culture and were always tempted to adopt their gods (*Jgs.* 10:6; *1 Sm.* 7:4, 12:10). Furthermore, kings often advanced polytheism by the introduction of foreign wives who kept their gods (*1 Kgs.* 11:7, 11:33). Amos accuses his contemporaries of worshipping Sakkuth and Kaiwan (*Am.* 5:26), two astral divinities. The prestige of the Assyrian pantheon exercised a profound influence on the populations of Israel. During the reign of Manasseh (688–642 BCE) a serious religious crisis broke out. Shaken by the triumphs of the Assyrians and the Chaldeans, the faithful turned to the gods of the conquerors (*2 Kgs.* 21:1–9, 23:4–14). They worshipped the sun, the moon, the *baals*, and the Astartes (*Jer.* 2:8, 7:9). Nergal and other divinities reigned in the sanctuaries (*2 Kgs.* 17:30–31). After 587 came the trial of exile, followed by a spiritual reform. The prophets' orations were beneficial for the piety of Israel, which regained consciousness of its monotheistic faith. Upon returning from exile, they were vigilant about keeping their distance from idolatry, which continued to threaten the people because of the populations that remained in Palestine, especially in Samaria. The reaction against idolatrous cults was especially characteristic of the syncretic attempts under Antiochus IV Epiphanes (*2 Mc.* 6:2). The entire Jewish nation drew tightly together around the faith in Yahveh.

The most formidable opponents of idolatry were the prophets and their prophecies. At the solemn unveiling of the golden calf at Bethel, a prophet appeared before Jerobam and announced Yahveh's threat (*1 Kgs.* 13:1–32). Elijah and Elisha fought against the worship of Baal and his priests (*1 Kgs.* 18:22–40). Amos reproached his Judean compatriots for letting themselves be seduced by idols (*Am.* 2:4). Hosea spoke harshly also, because in his eyes the worship of Israel had become idolatry (*Hos.* 4:12–13). Isaiah attacked the idols and announced their fall (*Is.* 2:20, 17:7–8, 30:22).

One of the important themes of the prophetic polemic is the emptiness of false gods. Idols are nothing but stone and wood (*Jer.* 16:20). Hosea does not hesitate to liken idolatry to fetishism, for in his eyes the image is set up in place of God (*Hos.* 8:4–6). Isaiah writes veritable satires of the Babylonian gods, whom he compares to nothingness (*Is.* 44:14–17). These mindless gods are carried about by beasts of burden (*Is.* 46:1–2). The theme of the idol as vacuous will continue its march, to be exploited by subsequent prophets (*Bar.* 6, *Dn.* 13:65–14:42). Moreover, it will crystallize into an imposing number of ironic and scornful terms: *nothingness, insubstantial puff of wind, lie, corpse*. Ezekiel's favorite word is *gillutim* ("dunghill"). Derision of false gods is a biblical tradition antedating the prophets and continuing after the exile (Preuss, 1971).

The *Wisdom of Solomon*, written in Greek on the eve of the common era, holds a veritable trial of idolatry, especially in chapters 13–15. The author rejects the worship of nature, idolatry, and zoolatry (worship of animals). However, while

remaining completely faithful to the biblical tradition, he reflects his time by paying homage to the beauty of nature and works of art. He attacks the Stoic conception of gods according to which Zeus was the ether, Poseidon the ocean, and Demeter the earth (*Wis.* 13:1–19). He attacks the dynastic cult of the Ptolemies (14:17–20) and the mystery religions (14:23). In his view, the adherents of zoolatry have completely lost their reason (15:18–19). It is in terms of an authentic Yahvism that he judges pagan religions. He considers idolatry a fundamental disorder because it gives the name of God to that which is not God (13:2, 14:15, 14:20). Furthermore, the faithful adore dead idols that are incompetent and powerless. This disorder, which comes from seduction, leads to a mental aberration that in the end produces a moral deficiency among the faithful, who fall into error if not into lechery. Yet even while condemning these mistaken ideas from which Abraham and the chosen people escaped, the author speaks of his admiration for art. The *Wisdom of Solomon* has left a veritable synthesis of biblical polemics against idols, a synthesis into which certain ideas from the contemporary Greek world have already entered.

IDOLATRY AND CHRISTIANITY. The study of idolatry from the point of view of early Christianity is linked to problems of the birth of Christian art and the question of images, their worship, and the refusal to worship them. The attitude to adopt toward idols had been prescribed to the Christians from the first decades of the church. The Christians coming from Judaism had very strong traditions. Christians who converted from paganism radically separated themselves from idols and their worship. They all lived in the midst of pagan populations who had proliferated temples, altars, statues, sacrifices, processions, and festivals in Egypt, Greece, Rome, and the Middle East. The rapid expansion of Christianity into the provinces of the empire obliged the church to take very clear positions in regard to pagan cults.

The biblical heritage. Traces of the Old Testament opposition to idols are found in the New Testament, where *eidōlon* appears several times in the Pauline epistles. *Galatians* 4:8 takes up the common theme of pagan gods who have no substance. In *1 Corinthians* 10:19, Paul states that when one venerates idols, one is appealing to demons. This idea had already appeared in *Deuteronomy* 32:17 and was developed after the exile as a result of the success of demonology. The Pauline polemic revives the notion that the pagans offer sacrifices to demons. Demonolatry is also denounced in *Revelation* 9:20. The double biblical theme of the emptiness of idols and the demonic character of idolatry will be taken up later by the apologists and the church fathers.

The biblical heritage concerning idols also reached Christians by a second route, namely that of Philo Judaeus. In *Allegory of the Law* Philo tries to differentiate the divinity from any human likeness, because "anthropomorphism is an impiety greater than the ocean" (*On the Confusion of Tongues* 27). In *On the Decalogue* (52–80) and *Of the Contemplative Life* (3–9), he writes two accounts of the pagan gods. Both

follow the same five-point outline: (1) a critique of the deification of the elements (earth, water, air, fire); (2) a critique of the deification of the sun, the moon, and the cosmos; (3) a critique of the gods considered as actors in mythology; (4) an attack against idolatry; and finally (5) a critique of zoolatry. J. Schwartz (1971) has called this “the Philonian schema.” It influenced the critique of idolatry by Greek and Latin apologists, who drew on it for part of their own polemical material. On the subject of the worship of statues and divine images, Philo writes, “Their substance is of rock and wood, which was completely formless just a little while before. . . . Fragments which were their brothers or their family have become vessels for bath water or foot-washing basins” (*On the Contemplative Life* 7).

The Greek apologists and fathers. In his first *Apology* (9.1–5), Justin Martyr collects the principal themes of second-century polemics against idols: The human form is not suitable to divinity; idols have no soul and are made from a base substance; they are works of depraved artisans and bait for thieves; they bear the names of maleficent demons in whose appearance they are clothed. In his *Apology* Aristides of Athens has no sympathy for the idols of the Greeks. He severely condemns the sin of worshiping created things but is even harsher toward the barbarians, who revere earth, water, the sun, and the moon, and create idols they present as divinities. In his *Libellus*, another Athenian, Athenagoras, attempts to show that making statues of divinities is recent. All such statues are the works of people whose names are known. The artists have therefore made gods who are younger than their creators. In short, all these idols are no more than fragments of creation that the faithful adore in place of the creator. After this interpretation of idolatry in the sense of fetishism, Athenagoras explains the manipulation of idols by demons. The demons urge the faithful to block around the idols, then during the sacrifices they lick the blood of the victims. But all these gods had once been humans. A heritage of the secularized Greek age of the centuries just prior to the Christian era, this theme of euhemerism was to be a weighty argument, one the Fathers would use continuously.

Clement of Alexandria wrote his *Protrepticus* in order to convince the worshipers of the gods of what he held to be the stupidity and baseness of pagan myths. He first tries to determine the origin and nature of idols. Blocks of wood and pillars of rock in ancient times, they became human representations thanks to the progress of art, of which the author gives a well-documented survey. Then Clement poses the fundamental question: Where did the gods represented by idols come from? The historical response to this question, inspired by euhemerism, is the deification of human beings, of kings who have declared themselves divine, and of kings by their successors. Clement then gives a theological answer, partly inspired by Plato: The pagan gods are demons, shadows, infamous and impure spirits. Consequently, the error and moral corruption of idolatry becomes clear. The error is serious, for it leads the faithful to worship matter and de-

mons as divine. The corruption of morals is a consequence of error: Idols excite lust and sensuality, which were invented by demons. To idolatry, Clement opposes the adoration of the true God, who shows humanity its proper dignity. Clement indicates this path of happiness by invoking *Deuteronomy* (5:8), *Exodus* (20:4), the *Sybilline Oracles* (4:4–7, 24:27–30), and Christian doctrine (*1 Pt.* 2:9; *Rom.* 6:4; *Jn.* 8:23). Chapter 4 of the *Protrepticus* is a veritable synthesis of the Christian concept of idolatry at the end of the second century.

The Latin apologists. The position taken by the Latin apologists in regard to the pagan gods constitutes a final stage. Here one again finds the Philonian schema of the *De vita contemplativa* (3–9). Yet, this schema is not a dead weight that condemns the argumentation of the Fathers to die-hard conservatism. Two facts emerge from the study of these documents: On the one hand, the researcher is witnessing a permanent renewal of the antipolytheistic argument; on the other hand, the authors take into account changes in the pagan cults, especially the rise of the mystery cults with their new religiosity. The documents appear at intervals from the late second to the fourth century: *To the Nations, Apology*, and *On Idolatry* by Tertullian; *Octavius* by Minucius Felix; *To Donatus, To Quirinius, To Demetrianus, Quod idola di non sint* by Cyprian; *Divinae institutiones* and *Epitome* by Lactantius Firmianus; and *De errore profanorum religionum* by Firmicus Maternus.

The pagan gods are not idols, states Tertullian: “We stopped worshiping your gods once we realized they do not exist” (*Apology* 10.2). He first substantiates his statement through history, for it is known where these gods were born and where their tombs are. He reproaches the pagans for claiming that their gods became gods after death because of their merits in the service of humans. After these considerations inspired by euhemerism, Tertullian tackles the question of *simulacra*. The statues are only inert matter, just like vases, dishes, and furniture. Insensitive to outrage or homage, these statues are given over to commerce if not to destruction. Tertullian treats these questions at greater length in *On Idolatry*, which undertakes to show that idolatry is the gravest sin, encompassing all others. He condemns painting, modeling, sculpture, and participation in public festivals, because idolatry hides beneath seemingly innocent actions. Furthermore, he forbids Christians to teach or to conduct business, for both pursuits require contact with idols. In short, all the powers and dignities of this world are alien to God; for this reason, Christians must likewise be forbidden the military life.

The Latin apologists also developed the idea that pagan gods are demons. Demonology held a place of honor at the beginning of the common era. Both Greek and Latin apologists transformed the false gods into demons. The fathers seized the opportunity to turn these demons, intermediary beings between humanity and divinity, into characters lurking in the shadows of idols. Minucius Felix explains that “the demons hide behind statues and sacred images and, by exhal-

ing their breath,” exercise their mysterious effects—spells, dreams, prodigies (*Octavius* 27.1–3). In *To the Nations* Tertullian speaks of the pagan gods represented by idols that the demons use as masks to deceive men, and in *On Idolatry*, he curses artists and workers who fashion these bodies for the demons. Minucius Felix does not hesitate to make the demons the beneficiaries of sacrifice. Taking up Tertullian’s notion that the devil, in the mysteries of Mithra, mimics the Christian faith, Minucius Felix accuses the devil of having plagiarized Christian ritual in the religions of Mithra and Isis. Firmicus Maternus develops this theory further and discovers the devil everywhere in paganism—in idolatry, zoology, the deification of sovereigns, and astrology. Thus a shaken paganism faces a decisive condemnation of idolatry and idols.

Augustine. In his *Against the Pagans*, completed in 311, the convert Arnobius attacked paganism, denounced the anthropomorphism of the pagan cult, ridiculed the pagans’ conception of the gods, censured their myths, and attacked the mystery cults. His disciple Lactantius, converted, like him, under the persecution of Diocletian, and began his *Divinae institutiones* in 304. Lactantius demonstrates that monotheism is the only form of belief in God consistent with truth and reason. Speaking of the general evil of polytheism, he explains it by euhemerism and by the ruse of demons who get themselves adored under divine names first in families and then in cities.

On August 24, 410, the hordes of Alaric entered Rome and subjected the city to pillage. The pagans accused the Christians of having destroyed the worship of the gods and thus chased away the city’s protectors. Augustine’s answer was the *City of God*, written between 413 and 426, whose twenty-two books constitute the last great apologetic work against ancient paganism.

The pagan gods were a prime target, but Augustine found himself confronting a paganism with multiple and contradictory aspects. Besides the divine populace of country rituals, there were the gods of the classical pantheon, deified men, and a Stoic pantheism that turned Jupiter into a world soul. Throughout the first ten books of *City of God*, Augustine launches a critique, in turn acerbic and ironic, of the Roman gods, polytheism, and mythology. To strike a fatal blow at the idols, he brings in Varro, Cicero, Seneca, Euhemerus, Apuleius, and Plato. He tries to fight Varro’s theology with its false gnosis of etymologies of divine names and its tripartition of gods introduced by poets, philosophers, and heads of state. But Augustine knows that idols are not mere beings without substance, invented during the course of history. These idols are also in the hearts of worshipers, for idolatry consists of worshiping creation or a part of it as God. This theme is developed in *On Christian Doctrine* and *On True Religion*, in which Augustine, not content with a critique of the idol, launches a critique of the idol’s worshiper, whom he considers a devil worshiper.

Thus, an essential aspect of Augustine’s criticism of idolatry is his study of demonology. After having reviewed some of the major themes of his predecessors, he virtually psychoanalyzes the work of demons in the life of idol worshipers. Evoked by humans, demons take possession of idols. The *simulacra* become animate, and the work of demons can be achieved because the idol is no longer inert: An invisible *numen* is present. The idol serves as body for the demon. It receives life from the demon, to whom it lends itself. By this means, the demon accomplishes his revelation. For this reason, Augustine repeats incessantly, “The gods are demons, and worshipers of idols are worshipers of demons.” Yet in book 8 of *City of God*, he diminishes the power of demons somewhat, because they are not gods. For Augustine, these false gods are lying angels who continue their struggle against the true God. The malice of the sin of idolatry is thus exposed.

Christianity since Augustine. Ever since the conversion of the empire to Catholicism, paganism had been in retreat. After one last revival under the emperor Julian, it found a tough opponent in Theodosius the Great (r. 379–395), who forbade idolatry as a crime of lèse-majesté. The fifth century witnessed the demolition of temples and idols; Augustine gave the final blow to pagan theology. But the church remained vigilant in order to uproot the last implantations of paganism and squelch its influence among the people. This preoccupation would be translated in three ways: penitential discipline enacted against the sin of idolatry; the teaching of morality, beginning with the writings of Tertullian; and the constant purification of Christian worship and vigilance regarding the veneration of saints. Several great controversies, especially iconoclasm and the Reformation, show that idolatry remained a preoccupation. In the sixteenth and seventeenth centuries, Protestants often accused the Catholic church of maintaining ceremonies and traditions tainted by idolatry. Recent discussions about the cult of the saints, the worship of images, and the origin of Christian worship show the historical and theological importance of the problem.

IDOLATRY AND ISLAM. An Arab proverb recorded by al-Maydānī says, “When you enter a village, swear by its god.” On the eve of the Hijrah, Arab tribes venerated many gods. In his work *Kitāb al-aṣnām* (Cairo, 1914), Ibn al-Kalbī described the prosperity of the cult of idols in the pre-Islamic age (Jāhiliyah). These idols were *aṣṣāb*, or raised stones; *garīs*, or stones upon which the blood of sacrifice was poured; sacred trees; and statuettes that were bought and sold at fairs and markets. Another word used by al-Kalbī, which is also found in the commentators of the Qurʾān, is *ṣanam* (pl., *aṣnām*), “an object venerated next to God.” The word has a Semitic origin and seems close to the Hebrew *semel*, “representation.” The word is found five times in the Qurʾān (6:74, 7:134, 14:38, 21:58, 26:1), designating the “idol” rejected by Muslims. In the pre-Islamic age *ṣanam* designated diverse objects: statues sculpted like the god Hubal, statues around the Kaʿbah in Mecca, and sacred trees and stones. These

stones, which received libations and became objects of worship, were *anṣāb* (sg., *nuṣub*); the Arabs carried them in their migrations. Therefore *ṣanam* does not mean “divinity.”

Al-Azraqī says that in Mecca there was an idol in every house. Through this proliferation of idols, the Arab invoked divinity. The gods of this vast pantheon brought the divine into the everyday realities of existence. The distinctions between various epiphanies resided in the names given them and the numerous sanctuaries. Onomastic documentation takes one back to a distant age where these idols existed, epiphanies of the divine. In addition, Hellenism introduced into Arab paganism heroes, ancestors, and genies from Petra, Palmyra, and other Hellenistic cities.

Another word is *shirk* (*mushrikūn*), which designates the act of associating a person with divinity; it is the word for polytheism. In the Qurʾān the word appears in the Medina *sūrah*s, where its use is frequent in Muḥammad’s attacks on the associators, the *mushrikūn* (*sūrah* 6:94, 10:19, 30:12, 39:4). Such persons are to be avoided by believers. One must not pray for them, even if they are relatives (9:114). Their sin will not be pardoned. The word *kāfir*, “unbeliever,” is more general and includes both the associators and the possessors of scripture (Jews and Christians). In the Qurʾān *shirk*, “associator,” is the opposite of *muslim*, “worshiper of God.” *Shirk* retains this meaning in the *ḥadīth*.

Muḥammad’s opposition to idolatry is a Judeo-Christian inheritance. Abraham becomes the prototype of the monotheistic faith that Muḥammad espouses. Abraham is to the prophets what the Arabs are to other Muslim peoples. Beginning with Abraham’s revelation, Muḥammad goes on to see in Islam not only the true monotheism but primordial hanifism (from *ḥanīf*, one who follows the original and true monotheistic religion; a Muslim), which was transmitted by Abraham’s son Ishmael, following in his father’s footsteps. It is in this original path that one discovers the Qurʾān’s opposition to idolatry.

Idols are the enemies of God and his worshipers. Referring again to Abraham, the Qurʾān condemns them along with the whole Semitic ancestral tradition, which is the origin of their worship, a worship radically opposed to the worship of the one true God (26:69–83). The same idea is found in the text of *sūrah* 21:53/52 to 70, which tells how Abraham smashed the idols worshiped by his countrymen. These idols had no substance and were incapable of creating anything (25:3–5/4). Moses had to intervene against the sons of Israel who, after their flight from Egypt, began to worship the idols that they made for themselves (7:134/138). Thus Muḥammad orders his followers to avoid the stain of idolatry and to serve God in complete fidelity (22:31/30).

Throughout the whole Qurʾān is found opposition to idols and idolatry. One must turn away from them (15:94) for they bring unhappiness to their worshipers (41:5/6), who are nothing but liars upon whom God will inflict torment after torment (16:88/86–90/88). The idolators’ error is a

grave one because they have no faith in God (12:106), to whom they compare mere creatures (30:30). A terrible punishment awaits them: They will be treated like their idols (10:29/28), who will abandon them to their sad fate when they stand before the fire (6:23–29). Because of the seriousness of this error, the law of the Qurʾān demands that Muslims neither marry a woman idolator nor give their daughters to idolators in marriage (2:220–221). The Qurʾān makes a distinction between idolators (associators) on the one hand, and possessors of scripture on the other, that is to say, Jews and Christians. However, the two categories of non-Muslims are guilty of infidelity in respect to God, as emphasized in *sūrah* 98. In *sūrah* 22:17 (evidently a later text), is found the opposition between Muslims on the one hand, and Jews, Christians, Sabaeans, and Zoroastrians on the other. The Qurʾān demands that Muslims fight idolators (9:36).

Idolatry consists of associating a god or gods with God (51:51, 50:25–26). This idea keeps recurring; it is the Qurʾān’s definition of idolatry, whence the word for associators. Idolatry is an insult to God, because honors reserved for him alone are bestowed on false gods. *Sūrah* 17:111 shows that there are three degrees of association: children, associates in kingship, and protectors (sg., *walī*). The idea of the protector is found several times in the Qurʾān. In *sūrah* 39:4/3, saints are divinities that the faithful worship because they consider them intermediaries who will bring them closer to God. From the beginning, in Islam, fear of idolatry led to the suppression of all mediation between the faithful and God. Association in kingship consists of putting false gods on an equal footing with the one and only God (14:35/30, 26:92, 26:98). It involves an actual insult to God, for the power of the Creator is given to beings who have no substance (32:3/4, 40:69/67, 29:41/42). These idols are only names (12:40); God is the sole master of the world and people. A third means of association consists of attributing children to God (43:81), an idea that appears repeatedly in diverse forms. The Qurʾān is undoubtedly alluding to polytheistic myths and statues of divinities in temples. *Sūrah* 23:93/91 tells of the quarrels of the gods who claim to be superior to each other. There is also mention of goddesses, daughters of God (43:15, 52:39). The most famous passage is *sūrah* 53:19–21, satanic verses about the three goddesses of the Ka’bah. These goddesses were highly honored in the pre-Islamic Arab world, with great financial returns for the tribe of Quraysh. At the beginning of his preaching, the Prophet did not dare touch them. After the seizure of Mecca in 630, however, he had all the idols of the Ka’bah destroyed in his presence.

The essence of idolatry resides in the insult to God by the associators, who confer on mere creatures the honors and worship reserved for the Unique, the Creator, the Master of the World. Like the apologists and the Fathers of the church, the Qurʾān insists on the work of the demon who impels men toward idols. Abraham asks his father not to worship Satan (19:45/44), who turns men away from the worship of

God (27:24). The demon is the patron of idolators (16:65/63) and as such is opposed to God (4:118/119). Consequently, idolatry becomes the demon's auxiliary (25:57/55). In *sūrah* 4:117, the Qur'ān says that idolators pray only to females, or to a rebellious demon.

Allāh is the creator God, judge, dealer of retribution, unique and one in himself, all-powerful, and merciful. He reveals himself through his prophets. He does not show himself, but is recognized in the signs of the universe, in the signs of God, *āyāt Allāh*. He can be known only by his word, his names, his attributes, and his deeds. In any case, he cannot be represented by an image or a representation. Islam is a religion without icons.

IDOLATRY AND HOMO RELIGIOSUS. Idolatry is a historical-religious concept that finds expression in the response and behavior of the three great monotheisms when confronted with the beliefs and the practices of the polytheistic religions they encountered along their way. This concept was developed in the course of discussions and confrontations with these monotheisms: three religions of the Book, depositories of a revelation, animated by prophecy and doctrines of salvation—religions that join humanity to a personal God who appears in history. Idolatry means divine worship of beings who are not God in the eyes of those who have defined worship as idolatrous. The word has a negative and pejorative connotation because to the faithful of a monotheistic religion, attitudes, behaviors, and rites that should be strictly reserved for the true God are turned by the idolator toward false gods. Thus, idolatry is a fundamental religious disequilibrium due to two paradoxical facts: on the one hand a divine cultus, on the other a substitute for the divine that is not God.

Fetishism is a historical-religious concept developed in the modern age by ethnologists and historians of religions, with a view to explaining the creeds of primal black peoples of western Africa. In *Du culte des dieux fétiches* (1760), Charles de Brosses tried to apprehend humankind in its archaic state of raw nature. He observed that ancient peoples worshiped animals, trees, plants, fountains, lakes, seas, stars, and rivers as contemporary primitives still do. To this worship, de Brosses gave the name *fetishism*, a term formed from the Portuguese *feitico* ("witchcraft, bewitched subject"). Humanity sees an active presence in the fetish, which provokes fear and the need for protection. Humankind obtains protection through the observance of rites. Thus, the fetishist worships the object directly, unlike in polytheism, which de Brosses viewed as a more structured religion in which symbols are characterized above all by the image and the statue.

Research has made the notion of fetishism more precise. Fetishism is the belief in the existence of a power, concentrated in beings or objects, that humanity must harness for its own well-being. This power is obtained by means of individual or collective rites. The beneficial result will be a function of the force obtained; therefore humankind uses a whole web of rituals in order to increase the force and then capture it.

The context here remains one of worship, but one in which ritual receives the greatest emphasis.

This parallel between two phenomena of worship, idolatry and fetishism, will allow one to better situate idolatry as a religious phenomenon perceived by the historian of religions. In this view, idolatry is the worship of a divinity represented by a substitute for the divine, called an idol. To grasp the different dimensions of this worship, the historians of religions center their research on *homo religiosus* at work in the exercise of this worship. They seek to understand human behavior through human rites and in the implementation of the human symbolic system.

In the Greco-Roman world, voices were raised against the adoration of divinity in human form by Heraclitus, Xenophanes, Pythagoras, Euripides, Diogenes and the Cynics, and Stoics such as Zeno and Seneca. Reflecting on the divinity, these thinkers tried to establish themselves as intermediaries between the philosophers' religion and that of the people. In this area, Plutarch's thought becomes apparent. Seeking to avoid the two extremes of superstition and atheism, he emphasizes that divine life and intelligence are not subordinate to humans. Likewise, he refuses the application of gods' names to insensate natures or inanimate objects (*De Iside* 66–67). In Egypt, he confronts zoolatry, which may lead to repugnant aberrations because of the worship of sacred animals. However, observing that the Egyptians were extraordinary inventors of symbols and emblems, Plutarch accepts the symbolism of the divine manifested in the life of beings. Consequently, he approves of those for whom these beings are an occasion to worship the divine.

During the first century of the common era, Dio Cocceianus (Chrysostomos) of Prusa, writing an apology for Greek art, affirmed: "We invest God with the human body since it is the vessel of thought and reason. In the complete absence of a primitive model we seek to reveal the incomparable and the invisible by means of the visible and the comparable, in a higher manner than certain barbarians who, in their ignorance and absurdity, liken the divinity to animal shapes." For Dio, plastic beauty expresses the divine. A century later the eclectic Platonist Maxim of Tyre treated the question of the legitimacy of portraying the gods. He notes that the Persians adored the divinity in the ephemeral image of fire; that the Egyptians contemplated their gods in objects and beings worthy of scorn; and that though the images may vary, the essential thing is to worship divinity: "God, the father of all things and their creator, existed before the sun and is older than the sky. . . . Since we cannot grasp his essence, we seek help in words, names, animal shapes, figures of gold, ivory, and silver" (*Philosophumena* 2.10).

Augustine leaves numerous allusions to the allegorical interpretation of idolatry by pagan authors. In *Expositions on the Psalms* 113 he speaks of certain people who claim that their worship does not really address itself to the elements themselves but to the divinities who are their masters. The same idea is found elsewhere in the same work (96), where

the idolator declares that he worships the statue he sees, but submits to the god he does not see; the statue is only a substitute for the divinity. The pagan authors targeted by Augustine are perhaps the emperor Julian, Porphyry, and Varro.

The history of religions approaches idolatry in terms of those four fundamental aspects of religious belief and practice that *homo religiosus* has been evolving from prehistoric times down to the present: the sacred, myth, rite, and symbol. The idol represents a hierophany in which humans perceive a manifestation of the sacred that clothes the object in a new dimension. This dimension is obtained by means of rites consecrating the objects of worship, altars, divine statues, and temples: Sacral presence and sacred space are indispensable. Through consecration, the image or object now belongs to the divinity and can no longer serve a secular use. The Egyptian rituals for opening the mouth, eyes, nose, and ears of a statue made to represent a divinity attest to a theology of the sacred in which the idol is an incarnation of power and life, a personification; it evokes the greatness of the god. Greek art tried to render this sacral dimension through the whiteness of marble or through protective coatings applied to the idols. Worship reactualizes myths that put the worshiper in contact with primordial time and furnish him models for his life. Thanks to this celebration, humanity again becomes contemporary with the primordial event, which awakens and maintains its awareness of a world distinct from the secular world.

This mythical behavior of *homo religiosus* is likewise found in Christian worship, but with an essential difference: The return to a primordial event is not a return to mythical time, but to the historical time of the life of Christ. The Incarnation is effected in a historical time: The Christians who celebrate the mysteries of Christ know that they are simultaneously attaining the historical time of Jesus and the transhistoric time of the Word of God.

Idolatry is the area in which rites and symbols are multiplied. For humankind, it is a matter of transcending the human condition through contact with the sacred. The human reference point remains the archetype. This is the role of ritual. Religions have left extraordinary documentation on the rites of celebration, as for instance the sacrificial rites of ancient Greece and Rome, as well as sacred meals with mystical participation of the gods through statues led in procession; rituals of sacrifice with three fires in the Indo-European world; rites of *soma* in India and of *haoma* in Iran; the symbolism of the cults of Cybele and Mithra; the rites of daily worship in Egyptian temples; the power of the rite and of the word in the imitation of the primordial gesture of the god Thoth, creator of the cosmos; funeral rituals of embalming in ancient Egypt, linked to the Osiris myth; and the symbolism of the altar and of gestures in Hindu temples. Incorporated in the life and existence of *homo religiosus*, the symbolism of worship has the function of revelation, for it is the language of hierophany. It reveals a dimension that transcends the natural dimension of life. Consequently, it in-

troduces a new significance into the life of individuals and society. In the celebration of worship, such sacred symbolism, myths, and rites help humankind to penetrate the mystery of salvation, a mystery that is represented by the holy history of human religion and culture.

Revised Bibliography

IGBO RELIGION. The Igbo are the largest ethnic group of southeastern Nigeria, numbering about fifteen million people in 2000. Until the mid-twentieth century the overwhelming majority of Igbo were farmers, raising yams as their staple crop. Traditionally, the Igbo lived in villages or village-groups surrounded by their farms. The village-group was the primary unit of political authority; there was no sustained tradition of centralized states within Igbo society. Rather, there were strong ties of the village community, the extended family system, age-group associations, and the various religious organizations that were important to community life. The Igbo have been exposed to Christian missionary activity since 1841; in 1857 an Anglican mission was opened at the important town of Onitsha along the Niger River. The Roman Catholics came in 1885. By the mid-twentieth century most Igbo had adopted Christianity, though the tensile strength of Igbo traditional religion sustained millions of devotees.

Igbo religion distinguishes between three types of supernatural beings: God, the spirits, and the ancestors. Ndigbo believe that there is only one supreme being, who is variously

known in different parts of Igboland as Chukwu, Chineke, Ezechitoke, Osebuluwa or Obasi di n'elu. Each name privileges certain attributes. He created the world and sustains it from above, and one of his praise names is "the one who is known but never fully known." Igbo parents honor Chukwu by naming their children in praise of his power: Chukwudi ("God lives"), Chukwu nyelu ("God gave"), Chukwuneka ("God creates"), Chukwuma ("God knows"), Chukwuka ("God is greater"), Ifeanyichukwu ("nothing impossible with God"), Chukwumeka ("God has been very kind"), Kenechukwu ("thank God"), Ngozichukwu ("blessing of God"), Chukwumailo ("God knows my enemies"), and Chukwujioko ("God is the sharer").

Chukwu is seen as a powerful, munificent God, the one who holds the knife and the yam and provides people with wealth, rain, and children, and who is merciful toward rich and poor, male and female, child and aged. Every morning the father of the family offers prayers to the supreme being. Chukwu does not intervene in the minor details of human existence, however; such matters he leaves to the spirits and ancestors, who are often described as his messengers.

The spirits (*alusi*) are powerful beings who inhabit the three dimensions of space—sky, earth (land and water), and ancestral world. There are several categories of spirits. Powerful sky deities manifest through thunder, lightning, sun, and moon; nature spirits inhabit rocks, hills, caves, trees, and land or farms. The guardian spirit of the earth is Ani/Ala, the earth mother. There is also a spirit associated with each day of the Igbo four-day week: Eke, Orié, Afor, and Nkwo. Patron spirits serve as guardians of hunters, farmers, fishermen, medicine men, and other professional guilds; the matron spirit is called Nne Miri or Mami Wata. Marine spirits inhabit rivers and streams. Human spirits, called *chi*, determine each individual's destiny. Spirit forces energize medicine that individuals can conjure and deploy for strength, protection, or to harm enemies. Ancestral spirits are the living dead who inhabit the spirit world but are involved in the lives of progenies in the human world. During festivals, they visit the human world as guests in form of masquerades. Evil spirits live in both human and spirit worlds. Only those who lived honest lives, did not die from inexplicable diseases, and had full burial rites can be ancestors or reincarnate. The spirits of evil people wander as *akalogolu* who appear on lonely farm roads to frighten people. Among the most dreaded evil spirits are *ogbanje*—spirits who manifest as children, covenanted to return to the marine world after a brief sojourn among human families. Their mission is to participate exuberantly in life events, tantalizing parents with their excessive beauty, friendliness, joy of living, and precocious habits. Near the appointed time of return, they develop unusual illnesses and die very suddenly. *Ogbanje* spirits tend to possess females. Parents consult *dibia afa* (divining healers, as opposed to *dibia ogwu*, who are adept with herbs), make sacrifices to marine spirits, and use facial scarifications on the children to discourage their return to the human world. Body marks at

birth may betray an *ogbanje* child (modern medicine suspects sickle cell anemia).

Benevolent spirits have shrines, priests, and religious festivals as part of their worship. The wicked spirits receive no regular cultic activity except the occasional offering made with the left hand as the supplicant asks to be left alone. Major ancestors have statues, which recall their spiritual power, located at a family shrine. Before drinking palm wine, the Igbo pour out a few drops in honor of the ancestors. The ancestors are believed to help the living reap a good harvest, have many children, and protect the family from misfortunes. Ancestors may also be reincarnated among the children of their descendants.

Acts of religious worship permeate daily life and are often conducted on behalf of family or village groups. A father's morning prayer to Chukwu is offered on behalf of his entire family. Individuals invoke the name of a spirit or even that of Chukwu when they sense danger, have cause to rejoice, when they sneeze, or when they approach a spirit's shrine. Prayers also accompany ritual sacrifice. They are offered to God, the spirits, and the ancestors, and can be prayers of petition, praise, or thanksgiving. The Igbo perceive time as cyclical, from birth to death and reincarnation. Rites of passage are celebrated: naming ceremonies, puberty rites, marriage rites, membership in secret and open societies, adult roles in communal governance, and funerary rites. Both the poor, *ogbenye*, and the rich, *ogalanya*, are judged after this life by their honest commitment to communal values.

Sacrifice is central in Igbo religious life. Sacrifices are offered for the expiation of sins, for protection from misfortune, to petition for assistance, and to offer thanks. Most are offered to spirits and ancestors, but in certain cases sacrifices of white chickens are offered directly to Chukwu. Sacrifices at family shrines are performed by the senior man of the family. Each spirit has its own priests who perform sacrifices at the shrine. Offerings include eggs, chickens, fruits, goats, cows, and (in a few rare cases of community sacrifices) human beings. Sometimes the victim—animal or human—is offered to a spirit and a little of its blood is shed as a sign of an offering, but the victim is allowed to live as a devotee who is consecrated to the spirit. Human sacrifices are sometimes connected with adjudication of disputes at oracular shrines. Oracles are graded according to purview. The three with the widest geographical patronage that extended beyond Igboland were Ogbunorie, Igwe-ka-Ala, and Ibin Ukpabi. The last acquired notoriety because the Arochukwu, who served as middlemen in the transatlantic slave trade manipulated the oracle by soaking the stream near the ravine that housed the oracle with red ochre wood and declaring that Ibin Ukpabi had eaten the guilty party in the arbitration. Meanwhile, they sneaked the hapless victim through the forest to a waiting slave boat. The colonial government conducted a raid on the Arochukwu community between 1901 and 1902, but could not wipe out the oracle. They fol-

lowed this with four other four raids between 1912 and 1925 against the oracle, still to no avail.

Healing is central to Igbo religion. *Ndi dibia ogwu* (herbalists) employ a variety of techniques to discern the spiritual cause of a particular malady or misfortune: a violation of taboos/prohibitions, moral failure, an offense against a spirit, or a bad personal fate (*chi*). A spirit, *agwu*, possesses the herbalist after he recites incantations, and it identifies the herb and the location in the forest for the cure.

Social control models include socialization into acceptable values (*omenali*), restriction through satires and peer joking relationships, punishment for those who flout the salient values, and reward for those who uphold them. Each control is legitimized with religion. For instance, theft from a farm threatens the food security of the community, so the elders invoke the spirits of Ahiajioku (the god of the yam who also guards farms), Ani/Ala (the earth mother), or ancestors to detect and punish the thief. The earth spirit and ancestors serve as guardians of morality. The most serious crimes are abominations committed against the earth spirit, such as patricide, suicide, incest, theft of crops or livestock, giving birth to twins, and killing sacred animals. Itinerant priests from Nri conduct the expiation of such abominations. Ndigbo employ covenants with the gods of their fathers to preserve social order, enhance the well-being of individuals and communities, and preserve the highest values, *nka na nzere*—long life and prosperity. They sacralize the whole of life.

FRANCIS A. ARINZE (1987)
 OGBU KALU (2005)

IGNATIUS LOYOLA (c. 1491–1556) was the author of *Spiritual Exercises*, founder and first superior general of the Jesuits, and a Christian saint. Iñigo López de Loyola was born to noble, wealthy Basque parents in the castle at Loyola, near Azpeitia, Guipúzcoa province, in northernmost Spain. Beginning in the mid-1530s he more and more frequently called himself Ignatius, although he also used his baptismal name Iñigo (Enecus in Latin). Up to 1521 his career gave no premonition of his subsequent development into one of the most influential religious figures of the sixteenth and later centuries.

EARLY LIFE AND EDUCATION. In the patriarchal family in which Iñigo spent his boyhood, loyalty to Roman Catholic doctrines was unquestioning, and observance of religious practices and moral standards was about average for its social class. At about the age of twelve Iñigo received the tonsure; but his father may well have intended this not to mark the start of a clerical vocation, but merely to be the means of procuring the income from a local benefice at his disposal.

A momentous change in the youngster's life occurred when he was between twelve and sixteen years of age. His father (who died in 1507, long after his wife) accepted the invitation of Juan Velázquez de Cuéllar to receive the boy into his home at Arévalo in Castile, and there raise him as if he were his own son, while preparing him for a career in politics, public administration, and arms. The wealthy and famous Velázquez would act as the boy's patron at the royal court, while utilizing his services as a page. Velázquez was the master of the royal treasury and a confidant of King Ferdinand the Catholic; his wife was an intimate friend of the queen. Baldassare Castiglione's famous *Book of the Courtier* (1528), a manual for the training of the polished gentleman and model courtier, details the type of education furnished to the young page, with emphasis on courtly manners and conversation, proficiency in music and dancing, fastidiousness about dress and personal appearance, devotion to the ruler, and skill in arms. Iñigo's literary schooling proved superficial, consisting mainly of avid reading of tales of chivalry, then very popular. As he later admitted, his mind was filled with the military and amorous adventures of Amadis of Gaul and other fictional heroes. These novels proved an important formative influence, however, for they fired an ambition to gain fame by great feats of arms.

As Iñigo developed into manhood—short (about five feet, two inches tall) but robust, well-formed, fair-haired with long locks—his activities included gaming, dueling, and amorous affairs. In 1515 he and his brother Pero, a priest, were hailed before a secular court for some unspecified deeds of premeditated violence perpetrated at night during the car-

nival at Azpeitia. They escaped sentence by appealing to an ecclesiastical court, whose judgment remains unknown. Another revealing incident took place a few years later in Pamplona. While Iñigo was walking along a street, a group of men headed in the opposite direction shoved him against a wall. Drawing his sword, he chased them and would have run them through had he not been restrained.

When Velázquez died in 1517, his page promptly entered the service of the duke of Nájera, viceroy of Navarre, as a courtier, with obligations to military duty if needed. During the revolt of the Comuneros, Iñigo fought in the forefront of the duke's forces in the victorious storming of Nájera (September 1520), but he refused to participate in the customary sack of the town as an act unworthy of a Christian or a gentleman. When the French invaded Navarre in 1521 and attacked Pamplona, its capital, the townsfolk surrendered without a struggle. Almost alone at a council of war, Iñigo advocated resistance to death in the fortress above the city. In the absence of a priest, he prepared for the end by following a medieval custom of confessing his sins nonsacramentally to a comrade-in-arms. During the six-hour bombardment of the citadel on May 21, a cannonball struck Iñigo, injuring his left leg and breaking his right one below the knee. This calamity moved the small garrison to surrender; it also effected a metamorphosis in the wounded man's life.

Chivalrously but inexpertly, the French tended Iñigo's injuries and then permitted their vanquished enemy to be carried back to his family home on a litter. In resetting the limb there, the surgeon shortened the broken leg and left a large, unsightly protrusion on the kneecap. Impelled by vanity, by a determination to return to his former lifestyle, and by romantic notions about impressing a lady of very high, perhaps royal, lineage, whose name is still the subject of conjectures and who may have been an imaginary figure, Iñigo insisted on further surgery. The lump was sawed off and the leg was stretched almost to normal length. During all these excruciatingly painful operations, performed without anesthesia, the iron-willed patient voiced no complaint.

To while away the tedium of convalescence, the sick man turned to reading. Because the meager family library lacked his preferred tales of chivalry, he accepted Spanish versions of Ludolph of Saxony's life of Christ and Jacobus de Voragine's *Golden Legend*, a collection of saints' lives. As he kept rereading and reflecting on these two famous works of edification, Iñigo developed an aversion for his worldly ideals and ways. He resolved to serve and imitate Christ alone and to emulate the deeds of the saints, although in a manner as yet undetermined.

SPIRITUAL LIFE AND LEADERSHIP. Early in 1522 Iñigo left home and started on a pilgrimage to the Holy Land. Soon he took a vow of perpetual chastity, dismissed his two servants, and disposed of all his money. At the Benedictine monastery of Montserrat on March 22–25, he gave away his mule and his fine clothes, donning a coarse pilgrim's garb

of sackcloth. Then he made a knightly vigil of arms, praying all night before the altar of Our Lady, where he discarded his sword and dagger. From Montserrat he proceeded to the nearby town of Manresa, where his stay, originally intended to last only a few days, extended to eleven fateful months. At Manresa, the pilgrim, as he now termed himself, refused to divulge his true identity. He led a life of great austerity and underwent bodily penances so severe that they permanently impaired his rugged constitution. Unkempt in appearance, he obtained food and lodging by begging, a practice he was to follow for years. At times he dwelt in a cave. Besides devoting seven hours daily to prayer on his knees, he read pious books, especially the *Imitation of Christ*, and performed works of charity.

At Manresa Iñigo also composed the substance of *Spiritual Exercises*, although he continued revising and expanding the text until 1541. In its opening paragraph the slender book describes spiritual exercises as “every method of examination of conscience, of vocal and mental prayer, and of other spiritual activities that will be mentioned later . . . to prepare and dispose the soul to rid itself of all inordinate attachments; and after their removal, to seek and find God’s will concerning the disposition of one’s life for the salvation of the soul.” Along with a number of annotations, rules, and notes, the text proposes points for methodical meditations and contemplations on various Christian doctrines and on some key topics original to the author, but mostly on incidents in the life of Christ.

Divided into four stages, called weeks, the exercises in their fullness are meant to occupy the memory, imagination, understanding, and will of a retreatant, under a director and secluded from temporal affairs, for thirty days, although considerable elasticity in length is permitted. Primarily the book is a manual of practical directives for a retreat director. Highly compressed and lacking in literary embellishments, the text is not designed for continued pious reading in the usual sense. The book was mainly the product of the author’s own experiences within himself and with others. It soon won acclaim as a spiritual masterpiece, original, unified, outstanding for its sound religious psychology and pedagogy, and remarkably well organized. Its contents manifest the essence of Ignatian and Jesuit spirituality, and it has exerted an enormous influence throughout the Catholic world down to the present day. As early as 1548, Paul III’s *Pastoralis officii* gave what has been termed the most explicit and honorable papal approval ever accorded a book. A long list of popes have added their own commendations, culminating with Pius XI, who in 1922 officially designated Ignatius as the patron saint of spiritual exercises.

From Manresa the pilgrim traveled by foot and by ship to Jerusalem, arriving on September 4, 1523, by way of Barcelona, Gaeta, and Rome and Venice. Only because he was denied permission to reside permanently in the Holy City, where he had hoped to spend his days visiting the sacred places and evangelizing, did he decide to return to Spain. He

set sail for Venice on October 3, 1523, and arrived in Barcelona in February 1524.

Study, motivated by a desire to help souls, preoccupied the next eleven years. After applying himself to Latin in Barcelona (1524–1526), Iñigo undertook university courses in philosophy at Alcalá (March 1525–June 1527) and Salamanca (July–September 1527). Extracurricular apostolic activities won the student a number of followers, mostly women, and aroused official suspicions regarding his apparent adherence to the heretical Alumbrados. During their investigations, diocesan officials at Alcalá imprisoned the uncomplaining suspect for forty-two days and those at Salamanca for an additional twenty-two, but in both cases Iñigo was exonerated. To escape the restrictions attached to his freedom, he migrated to the University of Paris (1528–1535), where he gained a master of arts degree in philosophy in 1534 and then studied philosophy for a year and a half.

In Paris, new followers were attracted by Iñigo’s spiritual exercises. On August 15, 1534, in a chapel on Montmartre, he and six companions vowed to dedicate their lives to the good of their neighbors, while observing strict poverty, and to journey to Jerusalem on pilgrimage or, if this proved impossible (as it did because of war), to place themselves at the disposal of the pope. Three others joined in the renewal of this vow a year later, bringing to ten the original membership of the as yet unforeseen Society of Jesus.

Heading for Jerusalem, Ignatius traveled in December 1535 to Venice, where his nine companions joined him in January 1537. He and six of the nine were ordained priests there the following June. After long deliberations with the whole group, Ignatius resolved to make their association a permanent, structured one, to be called the Society of Jesus. His First Formula of the Institute, a brief draft of a constitution, received solemn confirmation from Paul III on September 27, 1540, canonically establishing it as a religious order. The new order aimed at the salvation and perfection of its members, popularly known as Jesuits, and of all humankind. To this end it incorporated a number of innovations in its organization, manner of life, and scope of ministries.

In 1541 the other nine cofounders of the Society of Jesus unanimously elected Ignatius superior general for life. Under his leadership, membership increased rapidly, reaching about 940 at the time of his death, on July 31, 1556. Members dispersed throughout Europe and penetrated Africa, Asia, and the Western Hemisphere. They engaged in numerous pastoral, educational, and missionary labors, while moving to the forefront of the work of the Catholic revival and Counter-Reformation. As head of the highly centralized society, Ignatius played the key role in all this activity, as well as in the internal development of the order. He it was who devised, organized, supervised, or at least approved all these ministries, keeping in close contact with them through an enormous correspondence; some seven thousand of his letters have since been published. Besides admitting new members, choosing superiors, and regulating the spiritual life of

his fellow religious, he composed the Jesuit Constitutions, along with other religious instructions and rules. In Rome he founded the tuition-free Roman College (now the Gregorian University) and the German College to train priests for Germany. In addition he founded and won support for several charitable institutions.

Because of his rare combination of talents, Ignatius influenced modern religious life as few have done. He was at once a man of prayer, a contemplative, a mystic who reported many visions, a man of action, and a born leader not only in individual spiritual direction but also in practical projects of great magnitude. He was zealous in promoting the greater glory of God, and he was a sharp judge of persons and events: reflective, imperturbable, prudent, decisive, and wise in adjusting means to ends. His mode of government, while stressing obedience, was paternal, not at all military, as is sometimes argued. In personal contacts he was inevitably courteous, tactful, grave but pleasant and genial. He was beatified in 1609 and canonized in 1622.

BIBLIOGRAPHY

For editions of the writings by Ignatius in their original languages and in translations, as well as for the enormous secondary literature about him, see *Bibliographie ignatienne* (1894–1957), edited by Jean-François Gilmont, S.J., and Paul Daman, S.J. (Paris, 1958), containing 2,872 entries; *Orientaciones bibliográficas sobre San Ignacio de Loyola*, edited by Ignacio Iparaguirre, S.J., vol. 1, 2d ed. (Rome, 1965), with 651 items; and *Orientaciones bibliográficas sobre San Ignacio de Loyola*, edited by Manuel Ruiz Jurado, S.J., vol. 2 (Rome, 1977), adding another 580 items (both volumes contain evaluative comments and references to important book reviews). Complete annual bibliographies appear in *Archivum Historicum Societatis Iesu*, published since 1932 in Rome. An important source, although incomplete, brief, and ending in 1538, is *The Autobiography of St. Ignatius Loyola, with Related Documents*, translated by Joseph F. O’Callaghan and edited with an introduction and notes by John C. Olin (New York, 1974). Ignatius’s best-known work is available in several English translations; a particularly good version is *The Spiritual Exercises of St. Ignatius* by Louis J. Puhl, S.J. (Westminster, Md., 1952), reprinted many times. *The Constitutions of the Society of Jesus* has been translated, with an introduction and commentary by George E. Ganss, S.J. (Saint Louis, Mo., 1970). The best biography available in English is by Paul Dudon, S.J.: *St. Ignatius of Loyola* (Milwaukee, 1949). *Saint Ignatius Loyola: The Pilgrim Years* (London, 1956), by James Brodrick, S.J., covers the years 1491–1538 only and is written by a superior stylist. *The Jesuits, Their Spiritual Doctrine and Practice: A Historical Study* (Chicago, 1964), by Joseph de Guibert, S.J., is an authoritative study.

JOHN F. BRODERICK (1987)

IGNATIUS OF ANTIOCH (c. 35–c. 107) was a bishop and Christian saint, martyred in Rome. His name

may be derived from the Latin *ignis*, which means “fire,” but nothing is known of his origins. Origen relates that Ignatius was the second bishop of Antioch after Peter, but Eusebius of Caesarea writes that he was the third bishop of Antioch after succeeding Peter and Euodius (d. around 69) and thus the predecessor of Heron of Antioch (70–107). He may have met the apostles and most probably John and Paul, but there is no confirmation of this. In his letter to the Ephesians (9.2), he calls himself *theophoros*, that is, “God-bearer,” a man who bears in himself God and Christ. Indeed, his letters show him to be an exceptional man with an exceptional faith in Christ.

Although Ignatius lacked formal education, his rule as bishop was an illustrious one. During the persecutions of Emperor Trajan he was arrested, condemned, and ordered to be executed at Rome. Because of his high reputation, his execution in Rome would provide an example to the growing numbers of Christians in the East and at the same time an entertainment for the Romans, who delighted in witnessing the execution of prominent Christians. On his way to Rome, Ignatius was taken under the guard of ten soldiers to Smyrna, whence he wrote letters to the Christians of Ephesus, Magnesia Tralles, and Rome. From Troas he wrote letters to the churches in Philadelphia and Smyrna and to Polycarp, bishop of Smyrna. Apparently, throughout the long and exhausting journey, he was received by the Christian communities with great respect and reverence. Finally he was executed in the Colosseum of Rome. Another tradition, originating in Antioch and recorded in the sixth century by John Malalas, holds that Ignatius suffered martyrdom in Antioch, but such information is without any historical foundation. The Eastern church commemorates Ignatius’s name on December 20 and the Western church on February 1.

Most patrologists today accept the authenticity of seven letters of Ignatius. Because of Ignatius’s emphasis on the importance of the office of bishop, a dispute arose among patristic scholars during the fifteenth and then during the sixteenth centuries concerning the authenticity of the letters. Although there are four versions of these letters, the dispute has settled on the authenticity of the so-called long recension and short recension. The first contains thirteen letters and the second only three (those to the Ephesians, Romans, and Polycarp). Through vigorous discussion and debate by John Pearson (1672), Joseph B. Lightfoot (1885), and others, the authenticity of the seven letters has been accepted. Most recently, J. Rius-Camps (1980) advanced the theory that a forger, availing himself of the genuine ending of the letter to the Ephesians, and through a process of interpolation and plagiarism, composed three spurious letters to the churches of Philadelphia and Smyrna, and to Polycarp. The chief motive of the alleged forger, according to Rius-Camps, was to emphasize church unity and absolute obedience to the bishop. Such an elaborate hoax cannot be proved beyond dispute. The seven letters of Ignatius can still claim credibility and acceptance.

Although not a man of secular erudition, Ignatius, with his simplicity of style, his biblical language and idioms, and his emotional and passionate devotion to Jesus Christ, is one of the most attractive of the early church fathers. His great faith, humility, and willingness to suffer martyrdom for Christ are reflected movingly in his letters, which emphasize three central themes: Christ, the unity of the church under the bishop, and the Eucharist. He is probably the first father of the church to emphasize in clear terms both the divinity and the humanity of Christ: "There is only one physician—of flesh yet spiritual, born yet unbegotten, God incarnate, genuine life in the midst of death, sprung from Mary as well as God, first subject to suffering then beyond it—Jesus Christ our Lord" (*Letter to the Ephesians* 7.2). He is ready to die for Christ and only for him. "Of no use to me will be the farthest reaches of the universe or the kingdoms of this world. I would rather die and come to Jesus Christ than be king over the entire earth" (*Letter to the Romans* 6.1).

Ignatius is the first Christian writer to use the term *catholic* for the church, and he insists on the unity of the church under the auspices of the bishop. In his letter to the church at Smyrna he says

You should all follow the bishop as Jesus Christ did the Father. Follow, too, the presbytery as you would the apostles; and respect the deacons as you would God's law. Nobody must do anything that has to do with the Church without the bishop's approval. You should regard that Eucharist as valid which is celebrated either by the bishop or by someone he authorizes. Where the bishop is present, there let the congregation gather, just as where Jesus Christ is, there is the Catholic Church. (8.1–8.2)

Other letters declare the bishop to be *tupos*, or likeness, of God the Father and charge that nothing should be done "without the bishop." This unity under the bishop must have practical applications. To the Magnesians he writes, "Hence you must have one prayer, one petition, one mind, one hope, dominated by love and unsullied joy—that means you must have Jesus Christ. . . . Run off—all of you—to one temple of God, as it were, to one altar, to one Jesus Christ, who came forth from one Father, while still remaining one with him, and returning to him" (7.1–2).

Ecclesiastical unity should be expressed most especially during the Eucharist. Ignatius admonishes the Ephesians to

assemble yourselves together in common, every one of you severally, man by man, in grace, in one faith and one Jesus Christ, who after the flesh was of David's race, who is Son of Man and Son of God, to the end that you may obey the bishop and the presbytery without distraction of mind; *breaking one bread, which is the medicine of immortality and the antidote that we should not die but live for ever in Jesus Christ.* (20.2)

To the Philadelphians, he writes: "Be careful, then, to observe a single eucharist. For there is one flesh of our Lord, Jesus Christ, and one cup of his blood that makes *us* one, and

one altar just as there is one bishop along with the presbytery and the deacons, my fellow slaves" (4.1). The message is clear: one God the Father, one Jesus Christ, one Holy Spirit, one church, one Eucharist, one altar, one bishop. Only through this kind of unity will the Christians prove themselves real disciples of Christ and will Christ dwell in them.

The impact of Ignatius's letters was great. He dispelled the notion that the new religion offered a magical way of salvation and propagated the teaching that only through real unity in the life of the church and in the sharing of the corporate eucharistic life will Christians taste the joy of salvation and become members of the kingdom of God.

BIBLIOGRAPHY

A complete bibliography is available in Johannes Quasten's *Patrology*, vol. 1 (Utrecht, 1950), pp. 63ff. Texts of the letters can be found in *The Apostolic Fathers*, edited and translated by Joseph B. Lightfoot (1956; reprint, Grand Rapids, Mich., 1973); *The Epistles of Saint Clement of Rome and Saint Ignatius of Antioch*, edited and translated by James A. Kleist, S.J., "Ancient Christian Writers," no. 1 (Westminster, Md., 1946); and *Early Christian Fathers*, edited by Cyril C. Richardson, "The Library of Christian Classics," vol. 1 (Philadelphia, 1953). Especially valuable discussions of the letters are found in John Romanides's "The Ecclesiology of Saint Ignatius of Antioch," *Greek Orthodox Theological Review* 7 (Summer 1961–Winter 1962): 53–77; and in J. Rius-Camps's *The Four Authentic Letters of Ignatius, the Martyr*, "Orientalia Christiana Analecta," no. 213 (Rome, 1980).

GEORGE S. BEBIS (1987)

IGNORANCE SEE KNOWLEDGE AND IGNORANCE

I'JĀZ is the concept of the "miraculousness of the Qur'ān." That the Qur'ān is the miracle of Muḥammad is an Islamic doctrine of the utmost importance because it is held to prove the divine source of the holy Book, and hence its authority, as well as the authenticity of the Prophet to whom it was revealed. But what constitutes this miracle is a subject that has engaged Muslim thinkers for many generations. By the early part of the third century AH (ninth century CE), the word *i'jāz* had come to mean that quality of the Qur'ān that rendered people incapable of imitating the Book or any part thereof in content and form. By the latter part of that century, the word had become a technical term, and the numerous definitions applied to it after the tenth century have shown little divergence from the key concepts of the inimitability of the Qur'ān and the inability of human beings to match it even when challenged.

The idea of the challenge is based on several verses of the Qur'ān: in *sūrah* 52:33–34 there is a challenge to produce a discourse resembling it; in *sūrah* 17:88, to bring forth a like of it; in *sūrah* 11:13, to contrive ten *sūrahs* similar to

it; in *sūrah*s 10:38 and 2:23–24, to compose only one *sūrah* matching it, the latter *sūrah* adding, “and you will not.” The Qur’ān declares also that even if men and jinn were to combine their efforts, they would be incapable of producing anything like it (17:88) or even like one *sūrah* of it (10:38).

The argument, as in *Hujaj al-nubūwah* (Proofs of prophethood) of al-Jāhiz (d. AH 255/869 CE), that Muḥammad’s pagan Arab contemporaries failed to take up the challenge to discredit him, although they were masters of rhetoric and strongly motivated by opposition to Islam and by tribal pride, led some Muslim thinkers to associate the miracle with the Qur’ān’s sublime style. Others supported this argument by reference to the contents of the Qur’ān, highlighting its information about the distant past, its prophecies of future and eschatological events, its statements about God, the universe, and society—all of which were beyond an unlettered man like Muḥammad.

Early in the theological discussion, al-Nazzām (d. 846) introduced the concept of the *ṣarfah* (“turning away”) and argued that the miracle consisted in God’s turning the competent away from taking up the challenge of imitating the Qur’ān, the implication being that otherwise the Qur’ān could be imitated. This notion was acceptable only to a few, such as Hishām al-Fuwaṭī (d. 833?), ‘Abbād ibn Sulaymān (ninth century), and al-Rummānī (d. 996). On the whole, the Muslim consensus continued to hold to the stylistic supremacy of the Qur’ān. In his systematic and comprehensive study entitled *I’jāz al-Qur’ān*, al-Bāqillānī (d. 1013) upheld the rhetorically unsurpassable style of the Qur’ān, but he did not consider this to be a necessary argument in favor of the Qur’ān’s uniqueness and emphasized instead the content of revelation. On the other hand, al-Qādī ‘Abd al-Jabbār (d. 1025) insisted on the unmatched quality of the Qur’ān’s extraordinary eloquence and unique stylistic perfection. In volume 16 of his extensive *Al-mughnī* (The sufficient book), he argued that eloquence (*faṣāḥah*) resulted from the excellence of both meaning and wording, and he explained that there were degrees of excellence depending on the manner in which words were chosen and arranged in any literary text, the Qur’ān being the highest type.

The choice and arrangement of words, referred to as *naẓm*, have been treated in several books entitled *Naẓm al-Qur’ān*, such as those by al-Jāhiz, now lost, al-Sijistānī (d. 928), al-Balkhī (d. 933), and Ibn al-Ikshīd (d. 937). Al-Rummānī offered a detailed analysis of Qur’ānic style in his *Al-nukat fī i’jāz al-Qur’ān* (Subtleties of the Qur’ān’s inimitability) and emphasized the psychological effect of the particular *naẓm* of the Qur’ān without, however, disregarding other elements of content that render the Qur’ān inimitable. His contemporary al-Khaṭṭābī (d. 998) argued in his *Bayān i’jāz al-Qur’ān* (Clarification of the Qur’ān’s inimitability) that the source of *i’jāz* the insuperable manner in which Qur’ānic discourse binds meaning and wording, using various styles that combine literary qualities characteristic of the Qur’ān alone and that are conducive to a special psychological effect.

The author who best elaborated and systematized the theory of *naẓm* in his analysis of the *i’jāz* is ‘Abd al-Qāhir al-Jurjānī (d. 1078) in his *Dalā’il al-i’jāz* (Indicators of inimitability). His material was further organized by Fakhr al-Dīn al-Rāzī (d. 1209) in his *Nihāyat al-ijās fī dirāyat al-i’jāz* (Extreme concision in the comprehension of inimitability) and put to practical purposes by al-Zamakhsharī (d. 1144) in his exegesis of the Qur’ān entitled *Al-kashshāf* (The elucidator), rich in rhetorical analysis of the Qur’ānic style.

Hardly anything new has been added by later writers on *i’jāz*. In modern times, Muṣṭafā Ṣādiq al-Rāfi’ī (d. 1937) emphasized two points in explaining the sources of *i’jāz* in his *I’jāz al-Qur’ān wa-al-balāghah al-nabawīyah* (Cairo, 1926), namely, the insufficiency of human capabilities to attempt an imitation and the persistence of this inability throughout the ages. A more recent writer, ‘Abd al-Karīm al-Khaṭīb, offers four points in the same vein in his two-volume study *I’jāz al-Qur’ān: Dirāsah kāshifah li-khaṣā’is al-balāghah al-‘arabīyah wa-ma’āyirihā* (An elucidating study of the characteristics of Arabic rhetoric and its criteria; 2d ed., Beirut, 1975), namely, the absolute truth of the Qur’ān; its authoritative, all-knowing tone of speech; its beautiful *naẓm*; and its spirituality, which derives from the spirit of God.

BIBLIOGRAPHY

Abdul Aleem’s article “‘Ijazu’l-Qur’ān [sic],” *Islamic Culture* 7 (1933): 64–82, 215–233, surveys the development of the *i’jāz* doctrine and the major works on the subject. A shorter survey can be found in the introduction to *A Tenth-Century Document of Arabic Literary Theory and Criticism*, edited by G. E. Von Grunebaum (Chicago, 1950), which also contains a well-annotated English translation of the sections on poetry of Muḥammad ibn al-Tayyib al-Bāqillānī’s *I’jāz al-Qur’ān*. J. Bouman’s *Le conflit autour du Coran et la solution d’al-Bāqillānī* (Amsterdam, 1959) analyzes the theological discussions on *i’jāz* in their historical background and presents al-Bāqillānī’s in detail. John Wansbrough argues in his *Quranic Studies: Sources and Methods of Scriptural Interpretation* (Oxford, 1977), pp. 77–83 and 231–232, that the dogma of *i’jāz* developed more as an assertion of the Qur’ān’s canonical status within the Muslim community than as evidence of Muḥammad’s prophethood.

ISSA J. BOULLATA (1987)

IJĪ, ‘ADUD AL-DĪN AL- (AH 680?–756/1281?–1356 CE) was a Muslim theologian and jurist of the Il-khanid period. He originated from a well-to-do family of notables and judges living in the town of Īg in the province of Shābankārah, near the strait of Hormuz in the Persian Gulf. As a young man, he tried to make a career at the court of the Mongol dynasty reigning in Iran, the Il-khanids in Tabriz, and succeeded in winning the favor of the powerful vi-

zier Rashīd al-Dīn Faḍl Allāh, a Jew who had converted to Islam when the Mongols themselves finally gave up their inherited shamanist or Buddhist convictions. Rashīd al-Dīn gave him a teaching post at a mobile “university” that accompanied the Il-khanid ruler Öljeitu during his campaigns, but because al-Ījī was a Sunnī, his position may have become precarious when Öljeitu turned to Shiism in 1310. In the long run, he seems to have returned to Shābankārah, where, after the death of his father in 1317, he had to administer large estates that secured the wealth of his family in the form of a charitable trust (*waqf*). When Rashīd al-Dīn was executed in 1318, al-Ījī severed his relations with the court and returned only when Rashīd al-Dīn’s son Ghiyāth al-Dīn managed to take over the vizierate in 1327; he then became chief judge of the empire. However, with the end of the Il-khanid dynasty in 1335, he moved to Shiraz where he found the protection of the provincial ruler Abū Ishāq Injū and became chief judge of the town. His salary was much lower than before, but he enjoyed the atmosphere of an art-loving court and the company of poets such as Ḥāfiẓ Shirazi (d. 1390?). This phase of quiet life lasted for almost twenty years until, in 1354, al-Ījī’s patron was driven out of Shiraz by Mubārīz al-Dīn, a rival ruler whose sphere of influence also included Shābankārah. Al-Ījī therefore prudently knotted secret connections with the new man and escaped to his native town shortly before Shiraz was captured. His treason did not, however, go unnoticed. Apparently at the initiative of a former adherent of Abū Ishāq Injū, he was imprisoned in a fortress near Īg and died there in 1356.

Al-Ījī was a prolific writer. Many of his works are dedicated to Ghiyāth al-Dīn or Abū Ishāq. Intended as systematic handbooks for teaching in high schools, they have no claims to originality, but they are well structured and reflect the long scholarly tradition of the Muslim East, which had never been completely interrupted by the Mongol invasion. They cover the disciplines of scholastic theology, jurisprudence (according to the Shāfiʿī school), Qurʾanic exegesis, rhetoric and dialectics, ethics, and, to a certain extent, historiography. Their popularity is attested by the great number of commentaries on them. Some of them are still used in religious universities such as al-Azhar in Cairo. They have, however, been almost completely neglected in Western scholarship. The most important work among them is the *Kitāb al-mawāqif* (Book of stations), a concise *summa theologica* that, after the example of Fakhr al-Dīn al-Rāzī, explains traditional Ashʿarī doctrine in philosophical terms borrowed from Ibn Sīnā (Avicenna). It consists of six books, of which only the last two deal strictly with theological problems, which are subdivided into matters depending on reason (the essence of God and his attributes) and on revelation (eschatology, belief and sin, and so forth). The first four books are concerned with the general conceptual framework of theological discourse: epistemology, philosophical principles (such as necessity, possibility, eternity, and contingency), accidents, and substances.

BIBLIOGRAPHY

Further biographical information can be found in my article “Neue Materialien zur Biographie des ‘Aḍudaddīn al-Īgī,” *Die Welt des Orients* 9 (1978): 270–283. The *Kitāb al-mawāqif* was first analyzed in Louis Gardet and Georges C. Anawati’s *Introduction à la théologie musulmane* (Paris, 1948). I have translated and commented upon the first chapter of the *Kitāb al-mawāqif*, on epistemology, in my *Die Erkenntnislehre des ‘Aḍudaddīn al-Īcī* (Wiesbaden, 1966).

JOSEF VAN ESS (1987)

IJMĀʿ. The Arabic term *ijmāʿ*, which means “agreement” or “consensus,” becomes in Islamic jurisprudence the designation for one of the four sources of law posited by classical Sunnī theory, namely the consensus of the Muslim community. This consensus ranks as the third of the four sources, the first, second, and fourth of which are the Qurʾān, the *sunnah* (custom) of the prophet Muḥammad, and analogical reasoning (*qiyās*). For the majority of Sunnī legal theorists, the work of constructing legal rules is carried on by qualified scholars, called *mujtahids*, on behalf of the community as a whole. Whatever these scholars agree upon is therefore constitutive of the consensus of the community, and it is not necessary for them to take into account the views of an unqualified laity. The majority of theorists further hold that an authoritative consensus is fully constituted at the very moment when the community’s living scholars agree unanimously on a rule of law; it is not necessary to allow additional time for individual scholars to reconsider their decisions or to wait until the entire body of scholars involved in the consensus has passed away, thus eliminating any possibility of reconsideration. Once constituted, a consensus is irrevocable. It represents, in the view of all Sunnīs, an infallible and immutable statement of the divine law, or *sharīʿah*. As such, it is worthy to be made the basis of further legal constructions by individual scholars through either interpretation or analogical deduction. It is for this reason that *ijmāʿ* is included among the sources of law.

Sunnī theorists agree that the authority of consensus must rest upon revealed declaration and that all attempts to base that authority upon purely rational considerations are futile. The only self-constituted authority is that of the Creator-Lord; the authority of consensus can be nothing more than its derivative. However, the search for a clear-cut divine endorsement for the authority of consensus has been one of the most arduous tasks undertaken by classical Islamic jurisprudence. The various loci classici employed in this search have all proved to be in some degree problematic: The relevant Qurʾanic passages allow diverse interpretations, and the relevant dicta of the Prophet (as recorded in *ḥadīth*, the literary embodiment of the *sunnah*) are not only open to differing interpretation (despite their being in some cases more precise than the Qurʾān in their support of the authority of consensus, as in the case of the well-known dictum, “My community will never agree upon an error”) but are also fraught with

text-critical uncertainties. Scholarly opinion has therefore been divided as to whether or not the textual evidence for the authority of consensus is entirely conclusive. Among those who acknowledge that it is not, compensation for the resulting element of uncertainty is found in the principle that on issues relating to human conduct, an authority need not be conclusively grounded in the texts in order to acquire validity, so long as there is sufficient textual evidence to make the legitimacy of that authority more likely than its nonlegitimacy. In this view, the case for the authority of consensus thus rests upon the principle of the sufficiency of probable textual evidence.

While a few Sunnī theorists have conceded to the consensus the privilege of engendering rules that have no demonstrable textual basis, the great majority have restricted its role to granting finality to rules constructed on the basis of the texts. Accordingly, the consensus must emerge from the exegetical deliberations of individual scholars. Individuals qua individuals can at best, according to the general view, produce only probable constructions of the law; their exegesis can never be more than tentative. This exegesis is in fact called *ijtihād* (“exertion,” whence the term *mujtahid*) precisely because of its tentative character. The exegetes, as fallible mediators of the divine law, exert themselves in the effort to achieve, through philological procedures and analogical reasoning, the most accurate construction of that law possible for them. When the results of their efforts are confirmed by the consensus of their contemporaries, then, and only then, do these results acquire the stature of an infallible and immutable pronouncement. This confirmation may take the form of either explicit espousal or silent consent. The theorists differ, however, as to the value of the latter. The confirmation must, furthermore, be unanimous; a consensus cannot be constituted by a mere majority.

Because the Islamic tradition does not provide for the public certification or official convening of legal scholars and because unanimity on a scale vast enough to embrace the entire Muslim world would be difficult to achieve in the best of circumstances, the consensus, as conceived in the classical theory, has been virtually unrealizable throughout the greater part of Islamic history. While few theorists have accepted the view of Dā’ūd al-Zāhirī (d. AH 270/884 CE) and his followers, which restricted the prerogative of consensus making to the first generation of Muslims who were still alive after the Prophet’s death, it is not surprising that the classical theorists have generally drawn their examples of consensus from that generation. In so doing, they have implied that only in the earliest period of Islam, when those Muslims who had been in sufficient contact with the Prophet to be deemed authorities (“Companions of the Prophet”) were still concentrated in one locality, did the circumstances required for the constitution of a true consensus exist and that thereafter the consensus has remained more a theoretical possibility than a historical actuality. The notion that the consensus is identifiable with Muslim public opinion is distinctly modern.

In Shī’ī theory, consensus is reckoned among the sources of law, but it cannot, according to that theory, be regarded as properly constituted unless the divinely appointed leader, the imam, is present within the community. Because the word of the imam is considered infallible apart from the consensus, the consensus is deprived of the role it occupies in Sunnī theory as the infallible finalizer of rules of law and becomes, in effect, the community’s affirmation of solidarity with the imam, such that its teaching and his are one and the same. Thus, from the Shī’ī point of view, the consensus may be deemed a source of law only by special license, and this status is granted only insofar as the consensus is presumed identical with the doctrine of the imam.

BIBLIOGRAPHY

There is as yet no monograph in a Western language devoted specifically to *ijma’*. For a more extensive survey of the subject than the above, see the article “Idjmā’” by Marie Bernard in *The Encyclopaedia of Islam*, new ed. (Leiden, 1960–). On the controversies over the authority of consensus, see George F. Hourani’s “The Basis of Authority of Consensus in Sunnite Islam,” *Studia Islamica* 21 (1964): 13–60. The standard Islamicist view of *ijma’* and its historical development can be found within the pages of Joseph Schacht’s *An Introduction to Islamic Law* (Oxford, 1964). For a French translation of the writing of an important classical author, Abu’l Ḥusayn al-Baṣrī, on *ijma’*, see Marie Bernard’s *L’accord unanime de la communauté comme fondement des statuts légaux de l’Islam* (Paris, 1970).

BERNARD G. WEISS (1987)

IJTIHĀD. The Arabic word *ijtihād*, which in ordinary usage means “strenuous endeavor,” has become in the Muslim scholarly tradition a technical term for the endeavor of an individual scholar to derive a rule of divine law (*sharī’ah*) directly from the recognized sources of that law without any reliance upon the views of other scholars. Since these sources consist preeminently of texts, namely the Qur’ān, the *ḥadīth* (narratives recording the divinely sanctioned custom of the Prophet), and dicta expressing the consensus of Muslim scholars, *ijtihād* is a fundamentally text-related activity embracing two principal tasks: the authentication of texts and the interpretation of texts. These entail not only deliberation upon actual texts but also the working out of appropriate methodological principles. In carrying on *ijtihād*, a scholar, while not relying for final answers upon other scholars, does interact with scholars holding contrary opinions in a setting of a highly formalized process of disputation. The rules of law that the great scholars of the past have arrived at through *ijtihād* are recorded in the literature of *fiqh*, whereas the methodological principles of *ijtihād* are set forth in the literature of *uṣūl al-fiqh*.

THE TASKS OF IJTIHĀD. The text-critical tasks entailed in *ijtihād* relate mainly to *ḥadīth* and, to some extent, to historical material used to determine the existence of a consensus

in an earlier generation. The Qurʾān itself is considered by Muslim scholars to be of incontestable authenticity and therefore not in need of attestation through formal text-critical procedures. The focus of attention in all Muslim text criticism is upon the “chain of transmitters” (*isnād*), rather than upon the contents of the texts themselves. The examination of these chains itself entails a complex methodology, which is explored at length in the *uṣūl al-fiqh* literature. Considered as a purely individual scholarly activity, this transmission-criticism claims to be able to establish, at the very most, the *probable* authenticity of a text, although the degree of probability may—as in the case of “sound” (*ṣaḥīḥ*) *ḥadīth*—be very high. Once the degree of probability of a text’s authenticity has been determined, the scholar faces yet another task before he may proceed to interpret the text: He must determine whether or not, during the course of the Prophet’s lifetime, the text was abrogated by some other text, for only if it was not may he endeavor to derive a rule from it.

The process of deriving rules from the texts entails two distinct activities: (1) the determination of rules that lie within the meaning of the text, and (2) the determination of any additional rules that may be deemed analogous to these rules. The first of these activities constitutes a derivation of rules from the texts in the sense that it brings to light rules that are not immediately obvious from any particular text taken in isolation. One seldom encounters in the texts legally precise statements of rules, that is to say, statements having a form such as “*x* is obligatory upon all Muslims without exception” (*x* representing an unambiguous reference to a human act considered as a class or category). Such statements, which are necessary to the development of law in Islam, must therefore be extrapolated from the texts by scholars. In carrying on this task, scholars must deal with a host of problems relating to the language of the texts. A good example of these problems is the imperative form of the verb, which appears frequently in the sorts of texts that Muslim legal scholars tend to focus upon. One may not assume from the presence of an imperative in a text such as *aqīmū al-ṣalāt* (“Perform the prayer,” *sūrah* 2:43 and elsewhere) that an obligation is intended, for imperatives are used not only to impose obligations but also to invite, exhort, warn, permit, and so on. If, therefore, an obligation is intended, this can be known, according to the majority of Muslim scholars, only from the context. This context need not consist of the larger passage immediately surrounding the text in question, since *any* text within the corpus of recognized texts may shed light on any other text. This being the case, each text must be interpreted in the light of the entire corpus of texts, since virtually no text is free of some degree of ambiguity, vagueness, or generality. As the corpus of texts is vast and the greater part of it—namely, the *ḥadīth*—is subject, in greater or lesser degree, to text-critical problems, the work of Muslim legal scholars is perceived by the scholars themselves to be extremely demanding, and one can thus readily appreciate why they chose to call it *ijtihād*.

The use of analogical reasoning (*qiyās*) to deduce further rules from rules established through exegesis of the texts has been a matter of considerable controversy among Muslims. The main living adversaries of this method are the Twelver Shīʿī scholars. Among Sunnīs of all four surviving schools of law, the method is universally accepted, although an earlier school, namely that of Dāʿūd al-Zāhirī (d. 884), rejected it, and there is some evidence of its having been rejected by some scholars within earlier “traditionist” circles out of which the Ḥanbalī school arose. In any case, *ijtihād* is clearly not to be identified solely with *qiyās*, as some Western writers have been wont to do, since *ijtihād* has been as vigorously undertaken by opponents of analogical reasoning as by its partisans. In place of analogical reasoning, some Twelver Shīʿī scholars have espoused certain more strictly rational operations as valid methods of legal inquiry, which they have subsumed under the heading of *ʿaql* (“reason”).

In consideration of the enormity of the text-critical, interpretive, and deductive tasks just described, the Sunnī scholarly tradition acknowledges that certainty about rules of divine law is rarely possible and that the formulations of rules that emerge out of *ijtihād* represent the opinions (*ẓann*) of scholars, not hard knowledge (*ʿilm*). That this is so is especially evident in the face of differences of opinion that arise among scholars. On the other hand, the exegetical tentativeness of the rules constructed by scholars is deemed among Sunnīs to be no barrier to the validity and binding character of these rules. If the *ijtihād* of a scholar is truly representative of his very best efforts, then the opinions emerging from it are binding upon the scholar himself and upon all less qualified persons (*muqallids*, lit., “imitators”) who choose to follow his teaching.

The practice of following the opinion of a scholar in preference to engaging in *ijtihād* on one’s own is called, in Arabic, *taqlīd* (“imitation”). Through the *taqlīd* of the majority of Muslims, the *ijtihād* of scholars, whose number must necessarily be relatively small, is able to acquire authority within society at large and thus to engender law as a social force. The Shīʿī tradition recognizes both *ijtihād* and *taqlīd* but allows less scope for variation of opinion, emphasizing its preference for knowledge over opinion.

MUJTAHIDS. Since the law of God comprehends, in principle, the whole of life, it must be continually expounded as novel life situations present themselves. Consequently, the exercise of *ijtihād* is not a right but a responsibility, one that rests in every age upon the community as a whole. As with all communal responsibilities, it is discharged by the few (that is, the appropriately qualified scholars) on behalf of the many and could in principle be discharged by a single scholar. Those who engage in *ijtihād* bear the title of *mujtahid*, which, though in form a participle, becomes thus denotative of a status. While the claim to this status is theoretically a matter of individual conscience, any such claim becomes effective only after it has been validated by a substantial number of scholars. The validity of such a claim is considered to

be contingent upon the satisfaction of certain requirements, which are discussed at length in the *uṣūl al-fiqh* literature. These fall into two general categories: (1) mastery of the belief system of Islam and of its rational basis and (2) mastery of the rules of legal interpretation, text criticism, and (among Sunnīs) analogical deduction.

Eventually Muslim scholarship drew distinctions between different ranks within the general status of *mujtahid*, the highest being that of the "unrestricted *mujtahid*" (*mujtahid muṭlaq*), whose holders are free to engage in *ijtihād* within any field of law and to disregard the established doctrine of any school. *Mujtahids* in the various subordinate ranks, on the other hand, were bound to the general doctrine of a particular school and permitted to explore only those questions that had not been fully resolved within that school or were restricted to certain fields of law. The rigor of the scholarly qualifications varied from rank to rank.

Muslim jurists debated the issue of whether it was possible for the Muslim community to exist in any age without the presence of at least one *mujtahid* (a situation commonly referred to in later Muslim literature as "the closing of the door of *ijtihād*"), but a consensus seems never to have been reached on this matter. The general presumption of Muslim scholarship down to the modern age seems, in any case, to have been that *ijtihād* is, at least in its restricted forms, an ongoing process, even if it be on occasion temporarily interrupted. The requirements for the rank of *mujtahid muṭlaq*, however, were regarded as so demanding as to render the claim to this high rank extremely rare. Muslim jurisprudence has generally shown great deference for the great *mujtahids* of the early centuries of Islam, especially the founders of the schools of law. In Shi'ī Islam, this deference is intensified by the fact that the founders of Shi'ī law were none other than the infallible imams.

In the modern age, the concept of *ijtihād* has sometimes been applied, in an entirely unprecedented manner, to reformist legislation introduced by, or at least subject to the ratification of, elected parliamentary bodies. It has also been adopted by a variety of reform-minded Muslim thinkers, both "modernist" and "fundamentalist," as a rationale for programs calling for fundamental social change or intellectual reorientation.

BIBLIOGRAPHY

While virtually every general work on Islam or Islamic law—for example, Joseph Schacht's *An Introduction to Islamic Law* (Oxford, 1964)—deals to some extent with the subject of *ijtihād*, there is as yet no major scholarly monograph in a Western language on the scholarly activities that constitute *ijtihād*. For a cursory discussion, see my "Interpretation in Islamic Law: The Theory of *Ijtihad*," *American Journal of Comparative Law* 26 (1978): 199–212, and Abdur Rahim's *The Principles of Muhammadan Jurisprudence according to the*

Hanafi, Maliki, Shafi and Hanbali Schools (1911; reprint, Westport, Conn., 1981), pp. 69–115, 137–192.

BERNARD G. WEISS (1987)

IKHWĀN AL-MUSLIMŪN, AL- SEE MUSLIM BROTHERHOOD

IKHWĀN AL-ŞAFĀ' (Brethren of Purity) is a pseudonym assumed by the authors of a well-known encyclopedia of the philosophical sciences who described themselves as a group of fellow-seekers after truth. Members of a religio-political movement, they deliberately concealed their identity so that their treatises, entitled *Rasā'il Ikhwān al-Şafā'* (Epistles of the Brethren of Purity), would gain wider circulation and would appeal to a broad cross-section of society.

AUTHORSHIP AND DATING. Over the centuries, the authorship of the *Epistles* has been ascribed to the Mu'tazilah, to the Şūfis, to Imam Ja'far al-Şādiq, and to the great astronomer and mathematician al-Majrīṭī. The assertion of Abū Ḥayyān al-Tawḥīdī (d. 1023) that the treatises were composed by a group of learned men in Basra during the middle of the tenth century was widely accepted. Al-Qifṭī (d. 1248), the famous biographer of physicians and philosophers, expressed his skepticism of al-Tawḥīdī's attribution by acknowledging the prevalence of the belief that the treatises were composed by an 'Alid imam. In 1932 Husayn Hamdani stated that the Ismā'īlī Musta'li-Ṭayyibī tradition attributes the *Epistles* to the hidden imam Aḥmad. He also pointed out marked features of the treatises that are manifestly Ismā'īlī in character.

The Ismā'īlī character of the *Epistles* is therefore no longer in dispute. What is yet to be determined is the precise identity of their authors within the Ismā'īlī movement. Zāhid 'Alī and Wilferd Madelung consider the authors to have been Qarāmiṭah from Basra. On the basis of al-Tawḥīdī's comments and certain information provided by another contemporary Mu'tazilī author, al-Qāḍī 'Abd al-Jabbār (d. 1025), S. M. Stern also implies that the authors were Qarāmiṭah from Basra. Yves Marquet affirms the Ismā'īlī authorship of the *Epistles* and suggests that the composition might have begun under the hidden imams and that the authors mentioned by al-Tawḥīdī might have been later editors.

Abbas Hamdani has pointed out the weaknesses in al-Tawḥīdī's assertion and the untrustworthiness of his report and has published the earliest reference to the *Epistles* found in the Ismā'īlī literature. He therefore rejects the Qarāmatī authorship of the *Epistles* and argues that they were compiled by the Ismā'īlīyah as an ideological spearhead before the establishment of the Fatimid state in North Africa in 909.

CONTENTS OF THE EPISTLES. *Rasā'il Ikhwān al-Şafā'* consists of fifty-two philosophical treatises arranged in four

groups, a compendium (*Al-risālah al-jāmi'ah*, ed. Jamīl Ṣalībā, Damascus, 1949), and a compendium of the compendium (*Risālat jāmi'at al-jāmi'ah*, ed. 'Arif Tāmir, Beirut, 1959). The four sections are (1) "The Mathematical Sciences," fourteen treatises on numbers, geometry, astronomy, music, geography, theoretical and practical arts, morals, and logic; (2) "The Physical and Natural Sciences," seventeen treatises on physics, generation and corruption, mineralogy, botany, the nature of life and death, the nature of pleasure and pain, and the limits of human beings' cognitive ability; (3) "The Psychological-Intellectual Sciences," ten treatises on the metaphysics of the Pythagoreans and of the Brethren themselves, the intellect, the cycles and epochs, the nature of love, and the nature of resurrection; and (4) "The Divine Religious Sciences," eleven treatises on beliefs and creeds, the nature of communion with God, the creed of the Brethren, prophecy and its conditions, actions of the spiritual entities, types of political constitutions, providence, magic, and talismans.

The Brethren attempted to popularize learning and philosophy among the masses. Appealing to a multiplicity of races and religions, they developed a strong strain of interconfessionalism. Their attitude toward other religions is therefore strikingly liberal. They argued that religious differences stem from accidental factors such as race, habitat, and time and do not affect the unity and universality of truth.

The complete text of the *Epistles* was first published in 1305–1306/1887–1889 in Bombay, then in 1928 in Cairo (ed. Ziriklī), and most recently in 1957 in Beirut. However, a critical, reliable edition based on the widely scattered original manuscripts of the treatises has yet to be compiled.

SOURCES OF THE EPISTLES. The *Epistles* draw on a variety of sources. The Greek element has been dominant throughout; for example, Ptolemy in astronomy, Euclid in geometry, Hermes Trismegistos in magic and astrology, Aristotle in logic and physics, Plato and Neoplatonists in metaphysics. Another pervading influence is that of the Pythagoreans, especially in arithmetic and music. Of the Neoplatonists, Plotinus and Porphyry exercised the strongest influence. In astrology there are traces of Babylonian and Indian elements. There are also stories of Indian (Buddhist) and Persian (Zoroastrian and Manichaean) origin, and quotations from the Bible. Despite these diverse sources the authors have achieved a remarkable overall synthesis.

PARABLES AND THE ANIMAL STORY. The Brethren employ fables, parables, and allegories to illustrate and prove their doctrine while concealing their own identities; as a result, much of their doctrine remains hidden from the careless reader. The reason they give for hiding their secrets from the people is not their fear of earthly rulers, but a desire to protect their God-given gifts. To support their contention they invoke Christ's dictum not to squander the wisdom by giving it to those unworthy of it.

The dispute between humans and animals (part of the twenty-second epistle, entitled "On How the Animals and

Their Kinds Are Formed") is an allegorical story in which the animals complain to the just king of the jinn about the cruel treatment meted out to them by human beings. In the course of the debate, the animals refute humanity's claim of superiority over them by denouncing the rampant injustice and immorality of human society. This fable is a good example of the Brethren's sociopolitical criticism of Islamic society couched in animal characters. The most severe criticism is leveled against the wealthy (who go on amassing fortunes without caring for the needy), the privileged, and the ruling classes. The point is rendered more explicitly in the compendium (*Al-risālah al-jāmi'ah*), wherein it is stated that the animals in the story symbolize the masses who blindly follow their rulers, and the humans represent "the advocates of reasoning by analogy" (those who deduce legal prescriptions from the Qur'ān and the *sunnah* by reasoning and by analogy), the disciples of Satan, the adversaries of the prophets, and the enemies of the imams.

The story enjoyed wide popularity among the masses. It was translated into Hebrew during the fourteenth century and was rendered into Urdu-Hindustani by Mawlavī Ikrām 'Alī (Calcutta, 1811). In modern times it was translated into English by L. E. Goodman as *The Case of the Animals versus Man before the King of the Jinn* (Boston, 1978).

PHILOSOPHICAL SYSTEM. The philosophical system of the *Epistles* is a synthesis of reason and revelation wherein the cosmos is viewed as a unified, organic whole. The philosophical structure and the cosmology are derived from Neoplatonism and Neo-Pythagoreanism. Eclectic in nature, the system draws on various faiths and philosophies, with a strong undercurrent of rationalism. The Brethren offered a new political program under the aegis of an 'Alid imam, and their utopia, referred to as *al-madīnah al-fāḍilah al-rūḥānīyah* ("the spiritual, virtuous city") or *dawlat ahl al-khayr* ("the government of virtuous people"), was to be governed by a lawgiving philosopher-prophet. The organization and arrangement of the *Epistles* and their classification of the sciences reflect this ultimate objective.

God is described as absolutely transcendent, beyond all thought and all being. He is the One, the originator and the cause of all being. He is unique in every respect, and nothing can be predicated of him. The universe, which is quite distinct from the divine unity, is related to God by its existence (*wujūd*), permanence (*baqā*), wholeness (*tamām*), and perfection (*kamāl*). The universe is derived by emanation (*faḍl*), whereas creation, when it is spoken of, is understood as a form of adaptation to theological language.

The superstructure of the hierarchy of beings originates with the intellect emanating from God. The intellect, therefore, is described as the first existent being that emanates from God's munificence (*jūd*). It is a simple spiritual substance with the qualities of permanence, wholeness, and perfection. It contains the forms of all things and is in fact the cause of all causes. Second in the hierarchy is the soul, which emanates from the intellect. It is a simple spiritual substance

with the qualities of permanence and wholeness but lacking the quality of perfection. Third in the hierarchy is prime matter, which emanates from the soul. It is a simple spiritual substance that has permanence but lacks wholeness and perfection. It is also susceptible to form.

The cause of the intellect's existence is God's munificence, which emanates from him. The intellect accepts God's munificence and virtues (permanence, wholeness, and perfection) instantaneously, without motion, time, or exertion, on account of its proximity to God and its utmost spirituality. Because of its perfection it overflows with munificence and virtues into the soul. But as its existence is through the intermediacy of the intellect, the soul is deficient in receiving the virtues, and thus its status is below that of intellect. To procure goodness and virtue, it turns sometimes to intellect and at other times to matter. Consequently, when it turns to intellect for goodness, it is distracted from doing good to matter, and vice versa. Being imperfect, the soul becomes attached to matter, which lacks not only the virtues but also the desire to receive them. The soul, therefore, turning to matter, takes special care in its advancement by acting on the matter and by making manifest the virtues inherent in it. Hence the soul is afflicted with exertion, hardship, and misery in reforming and perfecting matter. When matter accepts the virtues, it attains wholeness, while the soul achieves its own perfection. When the soul turns to the intellect, is attached to it and united with it, it attains tranquillity.

The process of emanation terminates with matter. As the soul acts on matter, the matter receives its first form—the three dimensions (length, breadth, and depth)—and thereby becomes absolute body (*al-jism al-muṭlaq*) or universal matter (*hayūlā al-kull*). Thenceforth begins the realm of the composite (*ʿalam al-murakkabāt*). Next, absolute body takes its first form, which is circular because that is the best form. Thus, the spheres and the stars are formed from absolute body. Subsequently come the nine spheres beginning with the outermost sphere, which encompasses all spheres. Next to it is the sphere of fixed stars, followed by the spheres of Saturn, Jupiter, Mars, the sun, Venus, Mercury, and the moon. The higher the position of the sphere, the purer and finer its matter. The spiritual force that directs and manages each sphere is called the particular soul of that sphere.

Under the sublunar world comes the physical matter (*hayūlā al-ṭabīʿah*) of the four elements, fire, air, water, and earth. The earth, being farthest from the One, is the coarsest and darkest kind of physical matter. The active force of the soul that operates on the four elements through heat, cold, dryness, and wetness is known as “the nature of generation and corruption.” It moreover produces the generated beings that form the three kingdoms of minerals, plants, and animals. The active force operating on each of these generated beings is called the particular soul. Thus, the process wherein the soul mixes the elements to various degrees and thereby produces the generated beings terminates with man, who is the culmination of that process. Humanity is therefore the

noblest of all creation, and the rest of the three kingdoms have been made subservient to it. The unity and complexity of the human being's soul and body make him or her a microcosm. Humans, by virtue of their position, are the central link in the long chain of beings; below them is the animal kingdom and above them is the world of angels, and they are connected to both. In the Perfect Human Being, who has realized his divine origin, the process of generation in descending order comes to an end and the reverse journey in ascending order starts. The human being, therefore, fulfills the purpose of creation.

The *Epistles* occupy a unique position in the history of Islamic thought and exercised a great influence on the Muslim elite. The existence of a large number of manuscript copies of the text scattered throughout the Muslim countries is an eloquent witness to their popularity and influence.

BIBLIOGRAPHY

To the extensive bibliography provided by Yves Marquet in his article “Ikhwān al-Ṣafāʾ,” in *The Encyclopaedia of Islam*, new ed. (Leiden, 1960–), the following studies should be added: Abbas Hamdani's “Abū Ḥayyān al-Tawḥīdī and the Brethren of Purity,” *International Journal of Middle East Studies* 9 (1978): 345–353, and “An Early Fatimid Source on the Time and Authorship of the *Rasāʾil Ikhwān al-Ṣafāʾ*,” *Arabica* 26 (February 1979): 62–75; Hamid Enayat's “The Political Philosophy of the *Rasāʾil Ikhwān al-Ṣafāʾ*,” in *Ismaili Contributions to Islamic Culture*, edited by Seyyed Hossein Nasr (Tehran, 1977); and Ian R. Netton's *Muslim Neoplatonists* (London, 1982).

ISMAIL K. POONAWALA (1987)

IKKYŪ SŌJUN (1394–1481) was a poet, calligrapher, Zen eccentric, and revitalizer of the Daitokuji line of Rinzaï Zen. Ikkyū was likely, as legend suggests, the unrecognized son of the hundredth emperor of Japan, Gokomatsu (1377–1433; r. 1392–1412), by a rather low-ranking court lady. At an early age, perhaps for lack of any other option, his mother placed him in the Gozan temple of Ankokuji, in Kyoto. He spent the rest of his childhood in Ankokuji and in Tenryūji, yet another Gozan establishment. A quick student, Ikkyū was precocious in both scriptural studies and in the literary arts that had become a focus of the aesthetically oriented Gozan movement.

In 1410 Ikkyū left Tenryūji to live in the streetside hermitage of the eremitic monk Ken'ō Sōi (d. 1414). Ken'ō belonged to the Daitokuji-Myōshinji lineage of Rinzaï. Because these two temples had long been out of the Gozan orbit patronized by the shoguns, and because Ken'ō lacked formal certification of enlightenment from his own master, Ikkyū's decision to take him as spiritual master left the young monk doubly removed from the orthodox Zen establishment and clearly illustrates his desire to reach the substance of the Zen tradition rather than grasping for the formal honors offered by the power brokers of his day.

Ikkyū's devotion to the rigors of meditative life in preference to the aesthetic glory and institutional pomp of establishment Zen led him, after Ken'ō's death in 1414, to leave Kyoto to join the circle of the demanding master Kasō Sōdon (1352–1428), twenty-second abbot of Daitokuji, at his small hermitage at Katada on the shores of Lake Biwa. There, in 1420, Ikkyū attained *satori* but following the example of his early master, Ken'ō, refused to accept Kasō's certification.

Shortly thereafter, apparently following an extended squabble with Kasō, Ikkyū left Katada to spend several years in Sakai, a booming port town on the Inland Sea. There he gained a reputation for wild eccentricity, in part due to his repeated bouts of tavern and brothel hopping. These establishments, he claimed, were far better sources of enlightenment than the corrupt temples of Kyoto and Kamakura. Even Daitokuji came under his criticism, and although he was briefly appointed abbot of Daitokuji's Nyo-i-an subtemple in 1440, he soon stormed out in disgust at the temple's general pretentiousness and in particular at the role taken there by Kasō's chief disciple, Yōsō Sōi (1376–1458).

By the 1440s Ikkyū had once again taken up practice of the arts. He was eventually to become known for his unconventional poetry and his powerful, at times even unsettling, calligraphy. He was, as well, the confidant and friend of a number of key figures in the development of the new urban middle-class arts—the *nō* playwright Komparu Zenchiku (1405–1468); the early tea master Murata Shukō (1427–1502); the painters Bokkei Saiyo (dates unknown) and Motsurin Shōtō, also known as Bokusai (d. 1492), who wrote the earliest biography of Ikkyū; and the *renga* poet Sōchō (1448–1532)—and was thus an important conduit for Zen ideas and attitudes geographically outward from Kyoto and socially downward to the largely nouveau riche audience for these emerging arts.

In his later years, Ikkyū made peace with the hierarchy of Daitokuji and was appointed abbot of the temple in 1474, at a time when the temple was but a shell, its buildings having been almost entirely destroyed in the early battles of the Ōnin War (1467–1477). It was, indeed, in no small part Ikkyū's connections with the upwardly mobile merchant class of Sakai that provided the funds for the rebuilding and revitalization of Daitokuji and laid the foundation for it and its sister temple, Myōshinji, to fill the spiritual vacuum left by the intertwined collapse of the Ashikaga shogunate and the Gozan establishment. Ikkyū's final years were also marked by his famous autumnal affair with a blind woman singer called Mori. He died in 1481 at the age of eighty-seven. Popular fiction of the Tokugawa period made much of Ikkyū's eccentricities and transformed him from a serious historical figure into an amusing, but stereotypical, folk image, an image whose most recent manifestation was as the hero of a cartoon show on Japanese television.

Several literary works are attributed to Ikkyū. The most important of these are his collection of more than a thousand poems, the *Kyōunshū* (Crazy-cloud anthology), and the relat-

ed collection the *Jikaishū* (Self-admonitions). He was also the author of six prose works on Buddhist themes: the prose poem *Gaikotsu* (Skeletons); *Amida hadaka* (Amida laid bare); *Bukkigun* (The war of the buddhas and demons); *Mizukagami me-nashi gusa* (Mirror for the sightless), which includes the sometimes separated *Futari bikuni* (Two nuns); *Kana hōgo* (A vernacular sermon); and *Maka hannya haramitta shingyō kai* (Explication of the Heart Sūtra). Two *nō* librettos, *Yamamba* (Old woman of the mountains) and *Eguchi*, are also ascribed to Ikkyū, but these attributions are doubtful. A fair number of examples of his extraordinary calligraphy survive, as do a number of forgeries.

SEE ALSO Calligraphy; Gozan Zen.

BIBLIOGRAPHY

The fullest, though by no means either complete or perfect, treatment of Ikkyū in English is my own *Zen-Man Ikkyū* (Chico, Calif., 1981). Also useful are Donald Keene's biographical sketch, "The Portrait of Ikkyū," most easily available in his *Landscapes and Portraits* (Tokyo and Palo Alto, Calif., 1971), Sonja Arntzen's annotated translations of several dozen poems from the *Kyōunshū*, *Ikkyū Sōjun: A Zen Monk and His Poetry* (Bellingham, Wash., 1973), and her *Ikkyū and the Crazy Cloud Anthology* (New York, 1986). The best study of Bokusai's critical biography of Ikkyū is Hirano Sōjō's "*Ikkyū oshō nempu*" *no kenkyū* (Kyoto, 1977), which includes the whole of Bokusai's original text. The best, though still incomplete, study of Ikkyū's poetry is Hirano's *Kyōunshū zenshaku*, 2 vols. (Tokyo, 1976–). Ikkyū's prose pieces can be found in *Ikkyū oshō zenshū*, edited by Mori Taikyo (Tokyo, 1913). The fullest representation of his calligraphy is Tayama Hōnan's *Zenrin bokuseki kaisetsu* (Kamakura, 1965) and *Zoku Zenrin bokuseki kaisetsu* (Kamakura, 1965). Serviceable modern biographies on Ikkyū in Japanese include Furuta Shōkin's *Ikkyū* (Tokyo, 1946), Ichikawa Hakugen's *Ikkyū: Ransei ni ikita zenja* (Tokyo, 1971), and Murata Taihei's *Ningen Ikkyū* (Tokyo, 1963). For general background on the age in which Ikkyū lived, *Japan in the Muromachi Age*, edited by John Whitney Hall and Toyoda Takeshi (Berkeley, Calif., 1977), and Martin Collcutt's fine *Five Mountains: The Rinzaï Zen Monastic Institution in Medieval Japan* (Cambridge, Mass., 1981) are especially valuable.

ILLUMINATIONISM SEE ISHRĀQIYAH

ILMARINEN. According to the list of pagan Finnic gods compiled in 1551 by Michael Agricola, who introduced the Reformation to Finland and established the Finnish literary

language, Ilmarinen was the creator of both wind and calm weather and controlled travel on water. There is no evidence that Ilmarinen was ever worshiped, but what is probably the oldest stratum of *Kalevala*-type poetry concerning the exploits of Ilmarinen connects him with various cosmogonic acts. Elias Lönnrot's redaction of the *Kalevala* includes material from this ancient folk tradition but increases the number of his appearances, featuring him in twenty-seven out of the fifty divisions of the epic. Lönnrot also enhances Ilmarinen's personality with a human dimension.

The name *Ilmarinen* is probably derived from the Finno-Ugric word *ilma*, meaning "air," and, by extension, "weather" and "world." The Udmurts (Votiaks), distant relatives of the Finns and inhabitants of the region northeast of Moscow between the Kama and Vyatka Rivers, called their sky god Ilmar or Inmar. A famous Saami (Lapp) witch drum, presented in 1692 as an exhibit in court, depicts a god named Ilmaris as having the power to raise and calm storms at sea.

Among the epithets applied to Ilmarinen in the epic tradition is "shaper of the mysterious, luck-bringing *sampo*." *Sampo* is a difficult term, and scholarly research has produced more than sixty definitions for it, but according to the most widely held view, the *sampo* is a support of the world. A close derivative of the term is *sammas*, meaning "statue." A frequent substitute or parallel for the term is *kirjokansi*, meaning "brightly worked cover," which in other contexts stands for the sky. Certain Saami cult images in stone and wood are believed to be late representations of the *sampo*.

One folk poem places the forging of the *sampo* shortly after the genesis of the sky, earth, sun, moon, and stars, all of which, the poem claims, were formed by the breaking of an eagle's (in some versions, a waterfowl's) egg. The poem, which goes on to relate how Ilmarinen and his brother Väinämöinen steal the *sampo*, resembles the ancient Nordic sagas. But the epithet "shaper of the mysterious, luck-bringing *sampo*" refers to the tradition in which Ilmarinen creates the *sampo* himself, as in the episode in which, as a result of this act, he wins a competition against his brother for the beautiful maid of Pohjola. Together, Väinämöinen and Ilmarinen strike the primeval spark in the upper aerial regions.

Ilmarinen is also credited with forging a golden maid, who eventually proves no match for a real woman. Ilmarinen as smith-god later developed into a culture hero who makes useful objects for people and takes part in various adventures, including love-quests.

VENERATION OF IMAGES
IMAGES, ICONS, AND IDOLS

IMAGES: VENERATION OF IMAGES

The veneration of images involves humans or other subjects showing respect and homage to objects that visually represent, point to, or embody sacred beings or realities held to be especially worthy of honor. While such practices have been disputed in many religious traditions and decisively rejected by a few, the veneration of images has been a remarkably widespread form of ritual practice throughout history in many parts of the world.

The English terms used here, *veneration* and *image*, both derive from Latin, but they may be adequately used to translate such indigenous terms as the Indic *mūrtipūjā*. Deriving from the same etymological root as Venus, goddess of beauty and love, veneration refers both to feelings of deep respect and reverence toward some person or thing and to practices by which that respect and reverence are demonstrated or enacted. These practices may be bodily gestures, physical offerings, verbal expressions, emotional dispositions, or mental presentations. The subjects making these acts of veneration are most often humans but may also include animals, semidivine beings, divinities, other images, or even nature itself. Recipients may be venerable living persons like kings or religious teachers, remains or relics of venerable persons, images of divine or human beings, other objects considered particularly sacred such as holy books, or invisible presences. The range of religious practices of veneration then is very broad, and the veneration of images is only one part of this larger category.

The term *image* comes from Latin *imago*, which denotes an imitation, a copy, a likeness, among several other meanings. In its earliest English usage, image referred to a fabricated imitation or representation of the external form of an object and applied particularly to sculpted figures of saints and divinities that were treated as objects of religious devotion. As an ideal type, the veneration of images may be taken as venerative acts directed toward physical icons that represent divinities or other sacred beings anthropomorphically. However, divine beings are notoriously multiform, and they are

promiscuous in making themselves present in a great variety of objects. Not just sculpted images but paintings and drawings, abstract forms, diagrams, stones, trees, and other physical objects as well as mentally projected visualizations may serve as objects of veneration. More than simply signifying those beings, icons are often considered and honored as living beings, animated by the actual presence of the beings they represent.

In every ritual culture that engages with images, venerative practices take on a distinctive pattern in accord with the broader practices and premises of that tradition. Some ritual cultures may specify, for example, who is eligible to perform image worship according to criteria of birth, gender, age, initiatory status, or special training, whereas others leave the practice open to all devotees. Some may require that the worshiper undertake special preparations, such as physical purifications or mental concentration, before entering into worship, or that one wear special clothing. So too ritual cultures may prescribe how the image is to be prepared: its conception, fabrication, consecration, and regular maintenance as a venerated object. Ritual cultures may differ from one another as to the specific vocabulary of actions one should employ in venerating images and in the degree to which they formalize a prescribed etiquette of veneration. Religious traditions may develop distinctive theological understandings of the relationship of the image to the deity it represents, instantiates, or embodies. They may ascribe agency—moving, talking, miracle working—to the image or to the deity acting through it. Finally, different ritual cultures understand the efficacy of venerative practices in varied ways.

Widespread and varied as it is, the veneration of images has been a fiercely disputed practice. Even within ritual cultures strongly attached to the worship of images, adherents debate not only proper methods and understandings of such practices but also their ultimate value. Greek philosophers like Xenophanes and Heraclitus and Hindu ones like Śaṅkara sought to deprecate or delegitimize the venerative practices of their own societies. In some cases religious traditions have defined themselves through a shared opposition to the worship of images. Around the sixth century BCE Israelite prophets began to articulate a critique of the image-related practices of their Near Eastern neighbors, and this decisive break with image veneration subsequently became a defining feature of Judaism. Similar critiques were later deployed by the other Abrahamic monotheisms, Christianity and Islam, in their own moments of self-definition. Among all religions, Christians have shown perhaps the most complex historical ambivalence toward images, and this has led to several episodes of intense internal controversy and iconoclastic destruction.

Critiques of image worship originating with the Greeks and the Israelites have also had a decisive impact on the scholarly study of religion, as many scholars have observed. Earlier generations of comparative religionists constructed theological schemes in which the veneration of images fig-

ured lower on an evolutionary scale than aniconic forms of religiosity. Others developed what Peter Brown calls “two-tiered” models, where intellectual elites allegedly detach themselves from such popular practices as the worship of images. More subtly, as Leo Oppenheim noted in 1964, a scholarly ambivalence toward “idols” has often led scholars away from the serious investigation of image veneration in other religious traditions and toward the study of religious practices considered more comprehensible and acceptable in Western terms.

Only in the last two decades of the twentieth century, with calls to “rematerialize” the study of religion, did the exploration of the veneration of images, in its great historical and ethnographic variety as well as its history of dispute, become a more central topic in the history of religions and related disciplines. In his wide-ranging study *The Power of Images* (1989), the art historian David Freedberg seeks to identify and substantiate an innate human responsiveness to the image. At the other pole, the intellectual historian Alain Besançon, in *The Forbidden Image* (2000), traces a common philosophical disposition toward the absolute underlying the history of Western opposition to images from the Greeks up to twentieth-century Russian painters. In between the iconophilic and the iconoclastic, many scholars working in particular religious traditions have begun to explore more deeply the multiplicity of image-venerating ritual cultures. Drawing on this scholarship, this article outlines several examples of historical traditions that have practiced the veneration of images. It is not intended as comprehensive, but it does aim to illustrate some of the variety this practice takes in different settings and some of the ways it has been disputed.

MESOPOTAMIANS. Among the earliest known religious images are numerous female figurines, commonly called *Venuses*, found in European, Asian, and Middle Eastern archaeological sites and dating to the late Paleolithic and Neolithic periods. Some scholars have seen these as icons in a widespread cult of the “Great Goddess” linked to fertility and the emergence of agriculture. While they are intriguing as possible evidence for the ancient veneration of images, indications of how or even if these objects were employed ritually remains sketchy.

The earliest full evidence for image veneration comes from the early urban civilizations of Mesopotamia. Archaeological evidence, inscriptional records, and later texts all point to a ritual culture centered around images starting as early as the Sumerian period of circa 2500 BCE and continuing for nearly two thousand years. Within the Mesopotamian ritual culture, images that represented the gods were consecrated through a rite of “mouth opening,” then were maintained inside temples with regular offerings, and were processed outside their temples for annual festival celebrations. The best documented of these involve deities closely associated with city-states, such as Marduk in Babylonia and Anu in Uruk. Cults of these palladial deities were highly institutionalized and closely related to the political order.

In Mesopotamia the key ritual by which a human-made wooden statue was transformed into an animate divine icon was known as “opening the mouth” (*mīs pī*). As cited by Christopher Walker and Michael B. Dick in “The Mesopotamian *mīs pī* Ritual,” “The statue cannot smell incense, drink water, or eat food without Opening the Mouth.” Motifs of gestation and birth appear throughout the mouth-opening rites, for the ritual sought to give birth to the living presence of the deity. Moreover the ritual distances the image itself from any suggestion of human fabrication. Artisans would have their hands symbolically cut off with a wooden sword, and they were required to swear that they had not created the image. Rather, they averred, the patron deities of their guild had done so.

Once consecrated, the image took its place on a pedestal in the temple, often located in an elevated part of the city. The wooden image would be plated with gold, dressed in sumptuous clothing, and adorned with jewelry. It would be surrounded by other images that composed the god’s family and court, much as a king would sit in state surrounded by attendants. The daily services for such divine rulers were carried out by ritual specialists and consisted chiefly of elaborate feasts. At Uruk the god Anu ate twice a day. His meals, specified in detailed texts, included milk, beer, and other drinks; meat; bread; cake; fruit; and sweets. Musicians played during the repast, and priests burned incense to perfume the sanctum. After the god had eaten his fill of the offerings, the remainders were taken to the king as particularly potent nourishment. Receiving god’s leftovers was a definite marker of royal status.

Kings were also present in the temples in the form of royal images. Starting around 2100 to 2000 BCE, consecrated images of ruling kings were introduced as both venerators of the gods and recipients of veneration. A standing figure of the king might offer worship to the seated image of the god, while a seated image of the king could receive worship from his human acolytes.

In addition to the regular patterns of daily worship, the divine images celebrated special festivals. Central to many of these were public processions. If cultic practices within the temple were restricted to the religious and political elite, processions were occasions for much broader participation. The image-deities would leave their private temple-palaces and journey through the streets of the city to a festival temple in the countryside. On such occasions the more general public veneration reasserted the special relationship between deity and city-state.

GREEKS. In the *Iliad*, Homer describes Hekabe’s veneration of an image. The Trojan warrior Hector, Hekabe’s son, leaves the battle to ask the women and elders of the city to solicit the aid of the gods. Hekabe calls together the women and then selects her most beautiful brocaded robe as a presentation. The women process to the temple of the goddess Athena, on the Troy acropolis. The temple priestess Theano allows them to enter, and while the women cry out aloud,

Theano takes Hekabe’s robe and places it on the seated image’s knees. The priestess petitions Athena. If the goddess favors the Trojans by “breaking the spear” of their fierce opponent Diomedes, she prays, they will sacrifice twelve young heifers on her altar. Athena evidently does not agree to the terms, for as Homer relates, she turns away her head. Deities may be swayed by offerings but remain ultimately autonomous in their powers.

From Homer’s time through the classical period (roughly 800–300 BCE), the Greek gods and goddesses were present in anthropomorphic forms in myriad temples throughout the Greek world. Some ancient icons, like the famous olive wood Athena Polias in Athens, were said to have “fallen from the sky,” whereas others were explicitly associated with their human sculptors, such as the Athena Parthenos, also on the Acropolis in Athens, made by the celebrated Pheidias (between 447 and 438 BCE). The purpose of images was to make the gods visible to humans and to facilitate interactions between them. As Pythagoras is supposed to have said, “People who enter a temple and see the images of the god close up get a different mind” (Burkert, 1988). Greeks interacted with their gods in three ritual ways: sacrifice, votive offerings, and prayer.

Of these, animal sacrifice was preeminent in Greek ritual culture. Sacrificial altars were placed before the images in their temples. However, sacrifice does not require image or temple. A sacrifice offered on an altar in the open air could just as easily reach the gods dwelling on Mount Olympus. Greeks also made offerings of more permanent objects in association with vows. As Hekabe presented her brocaded gown to Athena, petitioners offered all sorts of valuable items to the gods in their temples: garments, vessels, weapons acquired as war booty, bronze tripods, gold bricks, statuettes, and votive tablets. Votive offerings (*anathema*) were showpieces meant to delight the recipient deity as well as to impress other human visitors to the temple. The gods and goddesses evidently enjoyed seeing themselves, for many of the tablets featured their representations along with the donor in the act of prayer or sacrifice. Greek temples often filled up with these showpieces, so much so that it might become difficult to see the deity. The sumptuous wealth deposited in the temples also made it necessary to protect them from thieves and looters. A common depiction of the temple priestess shows her holding a large key.

Beyond these special acts of worship, scholars know something about the ordinary etiquette of the Greek cult of images. Water basins near the temple entry indicate that physical purification was a prerequisite to entering. Once inside, worshipers greeted the divine image by falling to their knees and sought physical contact by touching or kissing it. Bodily acts of bathing and dressing the image were common venerative practices. Ritual specialists mediated these acts of worship between humans and the gods, as the priestess Theano did with Hekabe’s exchange with Athena. Unfortunately, however, Greek ritual specialists did not leave behind

records of their priest craft. Scholars do not know exactly how they performed the ritual of installation for new images or the daily liturgical routines for maintaining deities in their livelihood. And while Greek authors copiously recorded the mythological deeds of their gods and goddesses, they wrote little about the theological conception of the divine image. Much of what is written moreover is the work of critics.

To subvert the image worship of their fellow Greeks, the pre-Socratic philosophers Xenophanes (c. 560–478 BCE) and Heraclitus (c. 540–480 BCE) presented two primary arguments. According to Xenophanes, humans project their own attributes, with all their human flaws, onto the gods. If horses had hands and could create images of the gods, he argued, gods would appear as horses. Images are projections of humanity, not true representations of the divine. Heraclitus focuses on the materiality of images. To pray to a sculpted image is like trying to hold a conversation with a house; the image does not hear and does not give. Later Greek satirists picked up on the theme of an image's inanimate helplessness. So in parodies like “The Battle of the Frogs and Mice,” Athena complains that mice are nibbling away at her garments and fouling up her garlands. It is not possible to say how broadly these critical views were shared among Greeks of the classical period, though it is certain that many continued to address prayers to images and to present new robes to Athena.

JAINS. The earliest Indic inscription to refer to a venerative icon, dating to the first century BCE, concerns an image of Mahāvīra called the “Kalinga Jina.” The inscription reports how this icon, evidently of political import, had previously been taken away by the Mauryan ruler and was now recovered and ritually installed by Kharavela, ruler of the Kalinga territory. In addition to inscriptional evidence, archeological finds and early Jain texts indicate that the Jains developed and maintained a flourishing culture centering around the worship of Jina images in the early centuries CE.

Early Jain texts prescribe worship practices similar to those later classified as the eightfold *pūjā*, which is still the central form of worship among the majority Śvetāmbara Jain community. The eightfold *pūjā* is an individual form of image veneration. After first purifying himself or herself, a Jain worshiper enters the temple, approaches the image of worship, honors it with mantras, and circumambulates it in a clockwise direction. Worshipers mark their foreheads with sandalwood paste and then offer the eight components of worship. The first three offerings are applied directly to the body of the image: worshipers pour bathing water over it, smear marks of sandalwood paste on its limbs, and adorn it with flowers. The following five offerings are made in front of the image, not onto it. Worshipers offer incense, lamps, broken rice grains, food, and fruit before the image. After these physical offerings (*dravya-pūjā*) have been given, worshipers should perform mental veneration (*bhāva-pūjā*), an inward contemplation of the exemplary qualities of the Jina.

Among Jains, the dominant understanding of these venerative practices is reflexive. Because the Jain *Tīrthaṃkaras* are fully liberated beings who do not engage in the world after liberation, Jain worshipers do not expect them to inhabit their icons, and they do not expect them actually to consume food or fruit. Nor do they seek direct aid from the *Tīrthaṃkaras* in their lives. Jains view the veneration of images as an act of renunciation that is valuable for a worshiper in the shedding of karmic bondage. During each offering, worshipers recite verses that interpret the actions in terms of key Jain values and the worshipers' own states. While offering food, worshipers identify the Jina as the “noneating one” and express a wish that through renunciation they might also reach this state.

This austere conception of image veneration did not prevent Jains from developing an opulent temple culture, which reached its apogee in the image-filled hilltop temple cities of Shatrunjay and Mount Abu. Nor did it preclude lively devotional practices, such as the Jain laywomen who sing hymns of praise to accompany rituals of worship.

However, the issue of image worship was central to the primary sectarian split among the Śvetāmbara Jains. Starting from the critique of the fifteenth-century monk Lonka, the faction that came to be called the Sthānakvāsins argued that image worship is a feature of a corrupt world age and advocated instead mental worship and the veneration of living ascetics. The majority group remaining loyal to their image practices came to be called Murtipujakas, the image worshipers.

BUDDHISTS. Buddhist traditions often ascribe the first images of the Śākyamuni Buddha to the founder's own lifetime. When the Buddha left Kausambi to teach elsewhere, the story goes, King Udayana requested that the monk Maudgalyāyana supervise the fabrication of a stand-in image so that the king might continue to pay respects to the teacher during his absence. Thus was made the “Udayana Buddha.” When Śākyamuni returned to Kausambi, the animated image rose to honor its prototype. But the Buddha understood the pedagogic value of the image, for he honored it in return and predicted that it would play a great role in disseminating his teachings.

Modern historians of Buddhism have usually discounted such claims. While the question of the “origin of the Buddha image” has long been a topic of vigorous scholarly debate, a general consensus ascribes the earliest three-dimensional images of the Buddha to the period of the Kushans, who ruled during the first through the third centuries CE. The innovative step of fabricating physical icons of the Buddha was taken, more or less simultaneously, in two centers of the Kushan dominion, the Gandhara region of northern Pakistan and the city of Mathura.

Whenever the Buddha image did appear historically, the etiquette of veneration was already well established within Buddhist ritual culture. The earliest recipient of such honor

was the Śākyamuni Buddha himself. Early Buddhist texts are replete with accounts of humans, animals, semidivine Nāgas and *Yakṣas*, divinities like Indra and Brāhman, and even nature itself demonstrating veneration to the body (*śarīra*) of the Buddha through acts of prostration, circumambulation, flower garlanding, gift giving, and reciting of verbal praises. With the Buddha's *parinirvāṇa* and cremation, Buddhist venerative practices shifted to the Buddha's physical remains (also called *śarīra*) and other objects or places associated with this life. His relics were interred in moundlike stupas. These became flourishing cult centers of Buddhist veneration at least by the time of the Mauryan emperor Aśoka (r. 260–230 BCE). Worshipers honored the stupas, enlivened by the presence of Buddha's remains, much the same way they had once honored the teacher: with prostrations and circumambulations, flowers and incense, banners and parasols, and food offerings. More ambitious donors might arrange to have the entire stupa decorated with lamps or to have musicians serenade it. These appear to have remained relatively spontaneous and unstructured practices, because there are few liturgical prescriptions within the early Buddhist literature.

The introduction of the Buddha image offered another way of making the Buddha present. But there were debates over the degree of this presence. Worshipers might address the image as if it were the living Buddha, but as with the Jains, they generally understood the efficacy of veneration to reside not in the recipient but in the karmic benefits of the pious act itself. The image of the Buddha was a particularly fertile "field of merit" in which to sow the seeds of generous acts, but the Buddha did not directly reward such acts.

On the other hand, by the Gupta period in the fourth and fifth centuries CE, inscriptions point to a greatly enhanced sense of the Buddha's presence. During this period Indian monastic layouts regularly set aside a special cell, facing the entrance, where the Buddha image resided. Monks were assigned to tend to the needs of the Buddha, and endowments provided for the regular supply of flowers, incense, oil lamps, and other requisites to the Buddha. Moreover the inscriptions speak of the Buddha as the owner of the monastic property. Clearly the Buddha image became more fully established as a real living presence in the institutional life of the monastery. This significant change in Buddhist ritual culture may correspond to the introduction of new, more expansive philosophical ideas about the nature of Buddha's personhood.

Buddhist image practices figured prominently in the spread of Buddhism from India to other parts of Asia. According to tradition, Emperor Ming (r. 58–75 CE) of the Han dynasty had a dream of a radiant golden Buddha flying through the air and promptly sent emissaries to India to bring back Buddhist Scriptures and the famous Udayana Buddha. Images were so central to the early implantation of Buddhism that the Chinese referred to Buddhism as the "religion of images." The wealth of Buddhist imagery and venerative practices appear to have stimulated other competing

ritual cultures of China, including Daoists and Confucians, to integrate some aspects of image veneration.

HINDUS. Modern Hinduism may well feature more venerated images per capita than any other religious tradition. This was not always the case, though. In early India the primary forms of public religion receiving elite patronage were aniconic. The Vedas (composed roughly 1500–300 BCE) prescribed an elaborate program of fire sacrifices to deities who remained invisible. The earliest images of recognizable Hindu deities date from the Kushan period, contemporary with the early Jain and Buddhist images, and the earliest texts describing protocols for image worship appeared still later, around the fifth and sixth centuries CE. By the early medieval period (700–1200 CE), however, Hindu elites and ritual specialists had positively embraced the icon as an instrument of religious practice, and the veneration of images became the normative ritual culture of the public sphere.

In the early medieval period Hindu priests articulated new theologies and elaborate ritual programs for their divine images, and their formulations have continued to be influential over many centuries. For these Hindus, images are understood as one of the means by which a deity who is both transcendent and immanent makes himself or herself present and accessible to human votaries. Vaiṣṇava theologians speak of Viṣṇu's "incarnation as an image," parallel to his other incarnations (*avatāra*). Just as Viṣṇu manifests himself in human and animal bodies, so he can also enter into fabricated physical representations of himself.

Hindu image veneration places much emphasis on the act of seeing, known as *darśana*. A physical representation enables worshipers to see their god, who might otherwise remain beyond their ken, and the beauty of the divine body attracts their gaze and awakens their devotion. But the gaze is reciprocal; the god looks back. The key moment in consecrating a new Hindu image is not opening the mouth, as the Mesopotamians would have it, but opening the eyes. So Hindus often refer to the act of worship as "taking *darśana*," seeing and being seen by the deity present in the icon.

Hindu image veneration is offered daily, both by devout worshipers in private home shrines on their own behalf and by priests in public temples on behalf of the entire community. Prescriptions in medieval Śaiva priestly guides, for example, call for elaborate preparatory purifications. The worshiper, the place of worship, the icon, the substances to be offered, and even the *mantras* to be used in worship must all be purified. The priest approaches the primary icon, the abstract Śiva *linga*. Though Śiva is considered to be already present in the *linga*, the priest performs a detailed invocation, such that Śiva becomes "specially present" there for the duration of worship. At this point the offerings or services (*upacāras*) that are the core of Hindu image veneration may begin.

Through these services, the worshiper treats the divine person present in the icon as an especially esteemed guest or

as the sovereign lord of the cosmos. Priestly guides suggest that one may offer five, eight, sixteen, or as many as twenty-five services, depending on one's resources and ambitions. Among these services are many of the same offerings employed in Jain and Buddhist worship, such as flowers, incense, lights, prostrations, hymns, and food. If they share some of the venerative vocabulary, though, Indic ritual cultures have different ideas about many details, such as food offerings. According to Viṣṇu worshipers, that god partakes of the subtle portion of the food, and the substantive remains of Viṣṇu's meal, transfigured by contact with the divine, are then distributed to the community of worshipers as a physical manifestation of Viṣṇu's grace, called *prasāda*. Śaiva Siddhāntins also believe Śiva eats the subtle portion of food offerings, but they consider food that has come into contact with Śiva too powerful for human consumption. In Śaiva temples leftovers are passed on to another image, one of Śiva's semidivine followers, who is better able to handle them.

In medieval India, with its great temples, image veneration became the most visible manifestation of Hindu religiosity but not without opposition from other Hindus. Those loyal to the earlier Vedic practices of aniconic sacrifice fought a long discursive battle against the veneration of images. Others, like the devotional Vīraśaivas, satirized the cult of images in favor of more spontaneous and unmediated expressions of devotion (*bhakti*). Still others, like the nondualist philosopher Śaṅkara (c. 700–750 CE), advocated more “subtle” forms of practice as superior, such as “mental *pūjā*” offered through meditation to a nonsubstantive and imperceptible Supreme.

Hindus have selectively adapted new technologies to their practices of image veneration. New print technologies were adopted in the late nineteenth century and the twentieth century to enable the mass reproduction of inexpensive lithographic “God pictures,” which pilgrims can purchase and incorporate into their home shrines. Large temples employ monitors to televise the venerated image so that a larger audience may partake of *darśana*. And with the development of the Internet, prominent Hindu temples in India have developed websites so that far-flung worshipers can offer cyber veneration.

Over the centuries, despite internal and external critiques, Hindus have maintained their practices of image veneration, modifying and transforming them along the way. When Hindus emigrated from India in the nineteenth and twentieth centuries, images traveled with them. The multitude of new temples that Hindus constructed throughout the United States and the United Kingdom in the late twentieth century demonstrate the flexibility and vitality of Hindu venerative practices.

INCAS AND ANDEANS. In the fifteenth century and the early sixteenth century the Incas of Cuzco (Peru) built a large empire, subordinating more than one hundred different ethnic groups over an area along the Pacific Coast and through the

Andean Highlands. Within this newly established empire the Incas promoted a central state religion. They recognized a hierarchy of gods, in which the highest were Viracocha, the creator, and the Sun, first descendent of Viracocha. This imperial cult, however, coexisted uneasily with the ritual traditions of the conquered cultures, who had their own divine figures and practices. Both the Incas and their subjects venerated images.

In the center of Cuzco the Incas constructed a massive temple for the Sun, whom the Incas took as their own ancestor. Within the temple the Sun appeared in the form of a young boy made of pure gold. The image was put to bed at night and awakened in the morning. At noon women brought him his meal: a dish of maize, a serving of meat, and a cup of maize beer. After the Sun had consumed what he would of his meal, the remainders were burned in a silver cauldron, and the beer was poured into a drain through which it nourished the earth. Officials then raised their hands to the Sun and proclaimed their gratitude. Normally access to the inner sanctum was highly restricted, and ritual officiants observed high degrees of personal purification before entering. On special occasions, however, the Sun image was brought out into the central square of the city and received his meal in a more public setting.

The Incas constructed new Sun temples in areas they brought under control, and they required their subjects to show veneration to the Sun. Often these Sun temples competed directly with the shrines of local deities, called *huacas*. In Cajamarca on the coast, for instance, one of the most powerful of the *huacas*, named Pachacámac, occupied a massive pyramid temple. The Incas built a still taller temple to the Sun next to it. Local stories reflected the tension that subsisted between these two cult deities in which Pachacámac reluctantly ceded his preeminent status.

Huacas had once been superhuman beings walking the earth, and they were responsible for creating the landscape. But after completing their creative deeds or through conflict with another deity, the *huacas* turned into stone, sometimes in icon form and other times simply as prominent parts of the natural landscape. In such physical forms they lived on and continued to play a role in human affairs. *Huacas* were unpredictable. They were benevolently responsible for the health and prosperity of the community, but they might also bring disease, earthquakes, and crop failure. Therefore it was wise to attend to their needs assiduously.

Pachacámac resided in his pyramid in the form of a wooden pole whose top was carved in the figure of a man. Here too access was strictly limited. Priests fasted for a year before they could enter the inner sanctum. Properly attended and solicited, this deity, like many other *huacas*, could speak. Pilgrims from throughout the area brought him gifts of gold and textiles, conveyed their messages to Pachacámac through the priests, and hoped to receive an answer. In addition to the local *huacas*, Andeans also venerated special lineage gods

in icon form and household deities who appeared as small animal-shaped stones.

The Inca Sun, the more localized *huacas* and other deities, and their icons were all part of the complex ritual culture of the Andean region that the Spanish conquistadores encountered in 1532. As Catholics, the Spaniards brought with them a different attitude toward images.

CRITICS OF THE IMAGE: JEWS, CHRISTIANS, AND MUSLIMS.

Most image-venerating ritual cultures coexist with their critics, as shown, for the public worship of images seldom appears as an uncontested practice. It is possible also to trace a more sustained critique of images and their veneration in the West, deriving from both Greek and Israelite sources. Early Christian critics of the image drew on Greek writings as well as the Hebrew Bible in formulating their positions, and later the Islamic founders adapted them to their own theological vision.

Scholarship suggests that the strong monotheism and vigorous prohibition of image veneration in the Hebrew Bible may reflect the triumph of one group of “Yahweh-alone” partisans among the Israelites in the wake of the disastrous events of the sixth century BCE. After the destruction of Jerusalem in 586 BCE and the debilitating exile, this group advanced its own vision of the Israelite past and its notion of a proper Israelite ritual culture by exercising a dominant role in editing the Bible.

The Hebrew Bible opposes the veneration of images in two main ways. One is through direct prohibition. The Israelites were surrounded by ritual cultures, such as those of Mesopotamia and Egypt, that represented their gods in image form. In the second commandment Yahweh distinguishes himself as the God who refuses to be so represented. An insistence on Yahweh’s exclusive divinity in the first commandment coupled with the prohibition of images defines a distinctive identity for the Israelites and helps insure that they will not assimilate the cults of their neighbors. The second method of articulating opposition was through prophetic parody, such as those of Jeremiah and Isaiah. Jeremiah carefully describes all the steps in fabricating an icon: the cutting of the tree in the forest, carving the wood into an image, decorating it with silver and gold, and nailing it into place. However, he asserts, these practices are false. With its material roots, the image is “only wood.” There is no breath of life in it. Like Heraclitus, the Hebrew prophets argued that an image of wood or stone, fashioned by human hands, necessarily remained inanimate and could not serve as a vehicle for a god like Yahweh.

Early Christians, true to their Jewish legacy, maintained a critical attitude toward the use of images. Paul’s encounter with the Greek images of Athens, recorded in the *Acts of the Apostles*, serves as a paradigm. In Athens, Paul was revolted by the sight of “a city given over to idolatry.” However, in his speech to the Areopagus council, he did find one monument to praise: an empty altar inscribed “To an Unknown

God.” In Paul’s view this unrepresented divinity is the one the Christians worship. God does not reside in human-made shrines or images, because God is not dependent in any way on human hands. Following Paul, the early Christian writers of the second and third centuries CE attacked image veneration from several different angles. Justin Martyr (c. 100–165 CE) argued that images are without souls and cannot represent God. As essentially demonic forms, they constitute an insult to God. Tertullian (c. 155–220 CE) focused on the social dangers of idolatry and held that image veneration could unleash unwelcome emotional outbursts. Moreover in Tertullian’s view idolatry was an index of pagan culture, and it was crucial for Christians to distinguish themselves from the dominant Roman culture.

A more complex attitude began to develop in the fourth century CE, as Christianity itself became the dominant culture. With Emperor Constantine’s conversion around 313 CE, the Christian movement became an imperial religion. Whereas early Christians had been criticized for their impoverished ritual culture, with no altars and no temples, now Christians began to develop their own architecture and art. They also destroyed competing pagan images, such as those of Zeus. The introduction of a Christian representational art was also criticized from within. Augustine (354–430 CE) disapproved of those who would look for Christ on painted walls rather than in his written word. Other Christians looked for ways to accommodate the didactic value of Christian institutional imagery with the negative attitude toward images. Most influential was the distinction articulated by Pope Gregory I (r. 590–604 CE). Images are placed in churches, he ruled, not for worship, but solely for instructing the minds of the ignorant. Christian images would be officially educational and not venerative in purpose.

Gregory’s distinction provided one important legitimation but did not finally resolve the issue for Christians. The greatest debate, usually known as the Iconoclastic Controversy, began in the next century. By the eighth century the veneration of icons—painted images of holy persons regarded as particularly powerful and efficacious—had become widespread throughout churches and monasteries. Worshipers prostrated before the images, kissed them, and solicited their aid. During the same period the Byzantine Empire suffered political reversals at the hands of an expanding Ummayyad Islamic polity, and this sense of threat from a more iconophobic religious community contributed to the vigor of the debate. Some argued that God was using Islam to punish Christians for having fallen into idolatry.

Similar to the Israelites, early Muslims insisted first on the principle of *tauhid*, the exclusive divinity of Allāh. Images pose a threat to that divine hegemony, for there is always a danger that humans may come to venerate those images rather than Allāh. Moreover Muslims identified Allāh as sole creator. The *ḥadīth* traditions therefore especially condemn those who make images, because they seem to be laying claim to the creative prerogative of Allāh. Later Muslims in some

settings adopted more relaxed attitudes toward representational art, but the Islamic prohibition on the veneration of images remained firm.

Against this political background, Emperor Leo III initiated the controversy in 726 CE with an effort to purge from the church “the idolatry of image worship.” The iconodule, notably John of Damascus (675-749), responded by defending the “relative worship” of images without idolatry. As representations of the material appearances of Jesus, Mary, and saints in the flesh, their images could suggest or evoke for viewers spiritual realities that lay beyond. Leo’s next move was more forceful. In 730 CE he ordered all holy images removed from churches and all recalcitrant bishops removed from their positions. This put Christians in a new position altogether, for it required that they destroy not only pagan images but also statues and paintings of Jesus Christ and revered saints. The battle was joined for several decades, with repeated episodes of iconoclasm and persecution. Finally, in 787 CE the iconodule Irene (acting as regent for her son Constantine and later as empress) convened a council at Nice with monks sympathetic to her cause and issued a new decree. Holy images of Christ, Mary, and the saints may be set up in churches and honored with relative worship, though the highest form of veneration would be reserved for the imageless divine nature alone.

The unstable position of “relative worship” did not prevent further debates among the Christians. However, it did provide a reasonable legitimation for the icon-veneration practices as they developed in the Eastern Church, and it also laid the groundwork for the main institutional position of Western Christianity during the medieval period. With the Protestant Reformation of the sixteenth and seventeenth centuries, the battle of images surfaced once again. Starting in the 1520s Christians in many parts of Europe acted to reform their ritual culture by entering churches and cleansing them of images and other sacerdotal objects.

CONQUEST, CENTRALIZATION, AND ACCOMMODATION. Images and the ritual practices of veneration do not exist in isolation. They enter into larger religious debates about divinity and the world and into political struggles as well. In *Kings and Councillors* (1936), the anthropologist A. M. Hocart observed that religious iconoclasm and political centralization have gone hand in hand throughout history. In Hocart’s genealogy of iconoclasm, the Egyptian king Akhenaton (fourteenth century BCE) is the earliest recorded opponent of image veneration and the first to seek a single unified divine cult. This went with Akhenaton’s attempts to unite Egypt politically. Hocart followed his observation into the twentieth century and British-ruled Fiji, where the centralizing agenda of the Colonial Office sought to suppress the dispersed icons of the local spirit cults. Powers committed to colonial control have often—though by no means always—opposed the image venerating ritual cultures of the colonized.

In the Andes region, when the Incas conquered their neighbors, they extended their state cult into the region, but this did not entail the suppression of local *huaca* cults. Both groups of icons could live side by side, albeit in a hierarchical relationship. When the Spanish arrived in 1532, however, they proceeded along different lines. The public extinction of all prominent sites of indigenous idolatry was a key element in the policy of conquest. In Cuzco they systematically looted the Temple of the Sun, desecrated it, and converted it into a monastery. In Cajamarca, they broke down the door that kept Pachacámac sequestered and erected a tall cross on his shrine.

The Spanish victory in the Andes was rapid, and the Inca Sun images in their highly visible temples quickly succumbed. Many of the more deeply rooted local *huacas* were not so easy to conquer. By the seventeenth century the veneration of *huacas* was still widely practiced, though now their rites were performed in secret. Believing the process of Christianization incomplete, church authorities initiated a series of inquisitions to extirpate idolatry. Their task had become complex, however, for the boundaries of what were initially distinct ritual cultures had become permeable. Many Andean peoples viewed Christianity not as an exclusive salvific message but as one new source of spiritual powers among many. They incorporated Catholic practices with older local ones, even as the old ways were adapted to fit new circumstances. Ritual healing specialists might maintain icons of Jesus Christ and Mary along with those of *huacas* and lineage gods to employ their powers in curing the sick. Christian celebrants might venerate the local *huacas* with offerings of guinea pig and llama blood at the start of the feast of Saint Peter.

To the inquisitors all this appeared as idolatry. They collected the idols and publicly destroyed them. But even as they did so, other churchmen recognized that the links their parishioners made between Catholic statuary and their long-standing deities enhanced religious devotion. Statues of the Virgin Mary might take on characteristics of Pachacámac, Andean goddess of the earth, and the Inca Sun might lend its rays to Jesus’ halo. Devotees believed that notable images like the Virgin of Copacabana performed miracles and made pilgrimages to solicit their help. The new venerative practices might not meet Pope Gregory’s principle concerning pedagogic imagery only nor qualify with John of Damascus as relative worship. Yet out of these mutual accommodations Catholic churchmen and local Andean converts constructed a new ritual culture in which the veneration of significant Christian images played an important role.

VENERATION IN THE SECULAR WORLD. At first glance modern secular cultures might not seem hospitable to the religious veneration of images. Yet scholars have persuasively argued that venerative practices of a ritual character may be found in many secular locations.

In the context of national struggle, a religious image like the Virgin of Copacabana in Bolivia may come to be revered as a popular icon of nationhood without leaving her cathedra.

dral. Political elites in many secular polities generate their own iconographies of the nation in the form of flags, statues, and monuments intended to symbolize or embody founders, leaders, and national ideals. Examples range from the ubiquitous personal imagery and the extraordinary Victory Arch erected by Ṣaddām Ḥusayn in Iraq to public monuments like the Statue of Liberty and Mount Rushmore in the United States. Such national icons have their own venerative rites: ceremonial dedications, pilgrimage itineraries, and on-site guides who enforce proper decorum and instruct viewers on their meaning. Likewise acts of iconoclasm directed at these instantiations of the nation, from flag burning to the toppling of Ḥusayn's statue during the U.S. invasion of 2003, take on an iconic significance of resistance or conquest.

Visitors to modern art museums may also recognize that they are entering settings for secular ritual. In these temples viewers are asked to observe respectful conduct and to pay close, contemplative visual attention to the images they encounter there. Indeed many of the objects—particularly those in the Mesopotamian, classical, medieval, and non-Western sections—formerly resided in religious institutions, where some of them received their proper ritual offerings. Now relocated to the comprehensive institutions of the West, these same images are understood by new audiences to embody the collective artistic accomplishment of their cultures and of humanity as a whole. Museum viewers may hope for a transformative experience not through the intervention of Athena or Śiva but through a kind of communion with the artists and cultures of the collective human past.

BIBLIOGRAPHY

General comprehensive studies of image veneration are rare.

David Freedberg, *The Power of Images: Studies in the History and Theory of Response* (Chicago, 1989), is an ambitious attempt to explore a broad panorama of image-related practices. Alain Besançon, *The Forbidden Image: An Intellectual History of Iconoclasm* (Chicago, 2000), represents an erudite attempt to trace a Western genealogy for the critique of images. Among calls for the rematerializing of religious studies, Joanne Punzo Waghorne, *The Raja's Magic Clothes: Re-Visioning Kingship and Divinity in England's India* (University Park, Pa., 1994), is broad and persuasive. Peter Brown, *The Cult of the Saints: Its Rise and Function in Latin Christianity* (Chicago, 1982) presents the notion of “two-tiered” models in the study of religion. The term *ritual culture* as used in this article is drawn from Lawrence Alan Babb, *Absent Lord: Ascetics and Kings in a Jain Ritual Culture* (Berkeley, Calif., 1996).

A fine overview of image-veneration practices in Mesopotamia is A. Leo Oppenheim, *Ancient Mesopotamia: Portrait of a Dead Civilization* (Chicago, 1964), pp. 183–198. The volume edited by Michael B. Dick, *Born in Heaven, Made on Earth: The Making of the Cult Image in the Ancient Near East* (Winona Lake, Ind., 1999), contains valuable articles, including a detailed study of the mouth-opening consecration, by Christopher Walker and Michael B. Dick, “The Mesopota-

mian *mīs pī* Ritual,” pp. 55–121. Also important are two essays by Irene J. Winter, “‘Idols of the King’: Royal Images as Recipients of Ritual Action in Ancient Mesopotamia,” *Journal of Ritual Studies* 6 (1992): 13–42, and “Opening the Eyes and Opening the Mouth: The Utility of Comparing Images in Worship in India and the Ancient Near East,” in *Ethnography and Personhood*, edited by Michael W. Meister (Jaipur, India, 2000), pp. 129–162.

An excellent brief introduction to Greek temple culture is Walter Burkert, “The Meaning and Function of the Temple in Classical Greece,” in *Temple in Society*, edited by Michael V. Fox (Winona Lake, Ind., 1988), pp. 27–47. Burkert's *Greek Religion, Archaic and Classical* (Oxford, 1985), remains the standard overview; whereas Jan N. Bremmer, *Greek Religion* (Oxford, 1994), provides a valuable supplement to Burkert based on continuing research. For a detailed treatment of votive offerings, see F. T. van Straten, “Gifts for the Gods,” in H. S. Versnel, *Faith, Hope, and Worship* (Leiden, Netherlands, 1981), pp. 65–151.

Earlier scholarship on the Jains most often viewed the worship of Jina images as a borrowed and nonessential practice within the Jain tradition. John E. Cort's article, “Bhakti in Early Jain Tradition,” *History of Religions* 42 (2002): 59–86, provides an important revision, demonstrating that venerative practices were an integral part of the Jain tradition from an early period. Valuable studies of Jain ritual culture utilizing both ethnographic and textual materials are those of Babb, cited above, and John E. Cort, *Jains in the World: Religious Values and Ideology in India* (Oxford, 2001). Also noteworthy for its treatment of devotional practices among Jain women is M. Whitney Kelting, *Singing to the Jinas: Jain Laywomen, Mandal Singing, and the Negotiations of Jain Devotion* (Oxford, 2001). For an overview of Jain disputes over image worship, see Paul Dundas, *The Jains* (London, 1992).

For Buddhist traditions concerning the earliest Buddha image, see Martha L. Carter, *The Mystery of the Udayana Buddha* (Naples, Italy, 1990). The scholarly literature on the origins of the Buddha image is vast. Works of John S. Strong are particularly valuable for their description of the ritual culture of early Indian Buddhism. See especially Strong's “Gandakuti: The Perfumed Chamber of the Buddha,” *History of Religions* 16 (1977): 390–406. On the Buddhist cult of relics, a useful starting point is Kevin Trainor, *Relics, Ritual, and Representation in Buddhism: Rematerializing the Sri Lankan Theravāda Tradition* (Cambridge, U.K., 1997). Donald K. Swearer, *Becoming the Buddha: The Ritual of Image Consecration in Thailand* (Princeton, N.J., 2004), considers many issues surrounding the veneration of the Buddha image in the Theravāda school and provides a detailed ethnographic account of an image consecration. The essays of Gregory Schopen have significantly altered the study of Indian Buddhism and its material practices. Many of these essays are in Schopen's collection *Bones, Stones, and Buddhist Monks: Collected Papers on the Archaeology, Epigraphy, and Texts of Monastic Buddhism in India* (Honolulu, 1997). On the role of images in East Asian Buddhism, see the volume edited by Robert H. Sharf and Elizabeth Horton Sharf, *Living Images: Japanese Buddhist Icons in Context* (Stanford, Calif., 2001).

A good point of entry into the ritual cultures of Hindu image veneration is the collection edited by Joanne Punzo Waghorne

and Norman Cutler, *Gods of Flesh/Gods of Stone: The Embodiment of Divinity in India* (Chambersburg, Pa., 1985). Diana L. Eck, *Darśan: Seeing the Divine Image in India* (Chambersburg, Pa., 1985), explicates this important underlying concept in Hinduism. For a more detailed explication of Hindu worship as practiced by the Śaiva Siddhānta school, see Richard H. Davis, *Ritual in an Oscillating Universe: Worshipping Śiva in Medieval India* (Princeton, N.J., 1991). Among many valuable ethnographic accounts of image worship in Hindu temples, one of the most comprehensive is Françoise L'Hernault and Marie-Louise Reiniche, *Tiruvannamalai: Un lieu saint śivaïte du Sud de l'Inde*, vol. 3, *Rites et fêtes* (Paris, 1999). On Hindu disputes over the veneration of images, see Richard H. Davis, "Indian Image-Worship and Its Discontents," in *Representation in Religion: Studies in Honor of Moshe Barasch*, edited by Jan Assmann and Albert I. Baumgarten (Leiden, Netherlands, 2001), pp. 107–132.

For the Andes, Kenneth J. Andrien, *Andean Worlds: Indigenous History, Culture, and Consciousness under Spanish Rule, 1532–1825* (Albuquerque, N.Mex., 2001), offers a good starting point. Sabine MacCormack, *Religion in the Andes: Vision and Imagination in Early Colonial Peru* (Princeton, N.J., 1991), reconstructs Andean religion at the time of Spanish conquest and offers a nuanced portrait of Spanish perceptions of indigenous ritual culture. Verónica Salles-Reese, *From Viracocha to the Virgin of Copacabana: Representation of the Sacred at Lake Titicaca* (Austin, Tex., 1997), stresses continuity in the complex interactions of the *huacas* and the inquisitors in the seventeenth and eighteenth centuries. See also Kenneth Mills, *Idolatry and Its Enemies: Colonial Andean Religion and Extirpation, 1640–1750* (Princeton, N.J., 1997).

Moshe Barasch, *Icon: Studies in the History of an Idea* (New York, 1992), provides an excellent brief account of Western critiques of the image, ranging from Greeks and Israelites through the iconoclastic controversy. For a more detailed exploration of the biblical view, see Michael B. Dick, "Prophetic Parodies of Making the Cult Image," in *Born in Heaven, Made on Earth*, edited by Michael B. Dick (Winona Lake, Ind., 1999), pp. 1–53. Two works reconsider early Christian art in light of disputes over the image, Thomas F. Mathews, *The Clash of Gods: A Reinterpretation of Early Christian Art* (Princeton, N.J., 1993); and Paul Corby Finney, *The Invisible God: The Earliest Christians on Art* (New York, 1997). Works on the iconoclastic controversy are too numerous to mention. Among several works that explore iconoclastic practices of the Protestant Reformation, a noteworthy study is Lee Palmer Wandel, *Voracious Idols and Violent Hands: Iconoclasm in Reformation Zurich, Strasbourg, and Basel* (New York, 1995). David Morgan addresses the Christian ambivalence toward images in *Visual Piety: A History and Theory of Popular Religious Images* (Berkeley, Calif., 1998). A. M. Hocart, *Kings and Councillors: An Essay in the Comparative Anatomy of Human Society* (Cairo, 1936; Chicago, 1970) discusses iconoclasm and political centralization.

Among studies of secular iconography of the nation, Samir al-Khalil, *The Monument: Art, Vulgarity, and Responsibility in Iraq* (Berkeley, Calif., 1991), explores the significance of Ṣaddām Ḥusayn's Victory Arch; whereas Albert Boime, *The Unveiling of National Icons: A Plea for Patriotic Iconoclasm in a Nationalistic Era* (Cambridge, U.K., 1998), traces the history and interpretations of five key American icons: the flag,

the Statue of Liberty, Mount Rushmore, the Marine Corps Monument, and the Lincoln Memorial. In *Civilizing Rituals: Inside Public Art Museums* (London, 1995), Carol Duncan analyzes art museums as ritual settings for the visual contemplation of art objects. Richard H. Davis, *Lives of Indian Images* (Princeton, N.J., 1997), follows Hindu religious objects as they are relocated and reinterpreted in Western museums and other settings.

RICHARD H. DAVIS (2005)

IMAGES: IMAGES, ICONS, AND IDOLS

One way to categorize religious traditions is whether or not they accept or advocate the use of two- and/or three-dimensional objects to symbolize or embody the divine. Some traditions, such as temple Hinduism, Buddhism, and Orthodox and Catholic Christianity, see the use of such images as central to their theologies and rituals. In these traditions images can serve three functions. They can be understood to be representations or likenesses of deities, symbols of deities, or the deities themselves. Other traditions, such as some schools of Islam, Judaism, and Reformed Protestant Christianity, are iconoclastic or otherwise oppose the use of images. Still others, such as Lutheran Christianity and the Advaita Vedānta school of Hinduism, are ambivalent or indifferent to the use of images.

Scholars of art and religion generally prefer the use of the terms *image* and *icon* to *idol*, as they argue that the former terms are more objective and less judgmental. For most English speakers the word *idol* is inevitably associated with *idolatry* or *heathen idolatry*, and so brings with it theological implications of the biblical and Protestant critiques of images. *Idolatry* in this theological usage is just one of a number of forms of false religion, so one finds actions, beliefs, and ideologies as varied as market capitalism, warfare, violence, the contemporary U.S. military and its budget, nuclear weapons, undue reliance on technology, an individualistic focus on self rather than community, slavery, racism, apartheid, patriarchy, adulation of cultural heroes, contemporary mass media, National Socialism, Communism, nationalism, and even scientific objectivity decried by their critics as forms of idolatry.

Anthropologists, on the other hand, tend to be comfortable using the word *idol* and argue that it more accurately reflects the theological and ritual understanding of Hindus, Buddhists, and Jains who themselves use *idol* in English. Furthermore, they say not to use the term is to disrespect those who in good faith do use it, by implying that their use of the term betrays an ignorance of the negative connotations of *idolatry* in Abrahamic theologies. Still other scholars of religion prefer to use *idol* on the grounds that *image* is too neutral a term. These scholars argue that *image* does not convey adequately the depth of feelings aroused by idols in both devotees and critics. Notwithstanding the good arguments in favor of using *idol*, this essay will use *image*.

TYPES OF IMAGES. The difference between an *image* and an *icon* is in many cases an arbitrary one. In Christian usage,

icon refers only to two-dimensional representations of Jesus Christ, the Virgin Mary, or a saint, and so for many English-speakers *icon* calls to mind a two-dimensional object. Many scholars follow this theological distinction and use the term *icon* to refer only to two-dimensional objects. Most historians of art and religion use *image* to refer to any of many material objects, both of two and three dimensions, and restrict the use of *icon* to an image that is ritually consecrated and/or in some way participates in the divine substance of that which it represents.

Three-dimensional images can be of stone, metal, wood, lacquer, or clay. An image can be a figurative likeness (iconic) or abstract (aniconic). In India, the original image at a shrine is oftentimes an aniconic natural feature, understood to be a manifestation of divine power. As its popularity grows, patrons build increasingly elaborate shrines around the image and replace the original natural image with a humanly crafted iconic one.

Two-dimensional images generally are iconic. They can be on paper, wood, or cloth, and the figure can be painted, woven, or embroidered.

Some traditions, such as Buddhism and Catholic Christianity, employ both two- and three-dimensional images. Others, such as Hinduism and Jainism, exhibit a preference for three-dimensional images over two-dimensional ones. In Eastern Orthodox Christianity only two-dimensional images function as formal liturgical icons. Some objects, such as Hindu, Buddhist, and Jain *mandalas* and *yantras*, are low-relief carvings and castings that at the same time share visual features with two-dimensional icons.

Iconic images can be anthropomorphic and so represent a human form. Other iconic images depict animals, divine beings that combine human and nonhuman traits, or inanimate symbols such as a cross, a book, or a throne. The multiplication of images leads to issues of identity, as different forms are used to depict the same deity. Traditions with iconic images therefore develop an iconography, a detailed formal canon of distinguishing features of anatomy, color, clothing, ornamentation, and attributes held in the hands that allow the viewer to identify which deity or saint is depicted. The multiplication of images can also contribute to understandings of divinity as plural and diverse. Complex iconographies contribute to explicit polytheisms, with many deities, such as we find in the Hindu, Buddhist, Jain, Shintō, Daoist, Egyptian, and Greco-Roman traditions. They also contribute to implicit polytheisms of minor deities and/or saints, such as we find in Catholic and Orthodox Christianity. In contrast, explicit monotheisms tend to employ a simplified iconography or be iconoclastic.

The physical nature of images connects them to many other objects in the material culture of religions, such as relics, shrines, altars, clothing, staffs, scepters, ritual implements, and books. Only some of these objects, such as images, relics, books, and in some cases clothing, engender

long-standing and heated ideological disagreements. Images and relics in particular have been the focus of extended critiques and defenses, since they are most clearly tied to theological understandings of the relationships among divinity and humanity, and spirit and matter.

Images serve different functions in religious life. Some of them are visual symbols. They can be visual tools in the meditation of specially trained religious practitioners, who use two- or three-dimensional forms as props for visualization of deities. Images, especially two-dimensional ones with narrative themes, serve to educate people concerning essential religious truths or the history of a religious community. The Catholic pope Gregory the Great in the sixth century thus termed images “books of the illiterate.” This equation of images with books is often found in elite criticisms of images as being suitable only for commoners or other more childlike and less-educated members of a religious community.

Images often appear on the outside of temples and shrines. Here they can serve as markers of sectarian identity. On the outside and inside of temples images can also serve an ornamental function, as they add to the grandeur of a building.

CONSECRATION. When images function as visual markers, there is usually no need to prepare the image through special consecratory rituals. But many other functions do require such rituals. In particular, the Mesopotamian, Egyptian, Hindu, Buddhist, and Jain traditions developed complex rituals whereby images are infused with divine presence or otherwise consecrated for ritual use.

Mesopotamian texts from the first half of the first millennium BCE describe in detail a two-day ritual sequence for consecration that involved multiple mouth-washings (Babylonian *mīs pi*), each of which involved mouth-opening rites (Babylonian *pīt pi*). References to these rituals are found in texts from as early as the twenty-second century BCE. Egyptian texts from the first half of the first millennium BCE describe a consecration ritual also known as the opening of the mouth; some texts also describe these rituals as involving the opening of the eyes, nose, and ears of the image. Hindu images are consecrated in multiday-festivals that both install vital breath in the image (Sanskrit *prāṇa pratiṣṭhā*) and anoint the image with pure water and many other liquids (*abhiṣeka*). Jain consecration rituals distinguish between the enlivening of the image through opening its eyes in a rite called literally the “eye-needle” (Sanskrit *añjana-salākā*), and the establishment (Sanskrit *pratiṣṭhā*) of the image on an altar for worship. Buddhist rituals throughout Asia employ the two ritual paradigms of opening the eye of the image (Sanskrit *netra-pratiṣṭhāpana*) and anointing it (*Buddha-abhiṣeka*). In Tibetan Buddhist consecrations the focus is on the establishment (Tibetan *rab gnas*) of the Buddha-nature (Tibetan *ye shes sems dpa'*, Sanskrit *jñānasattva*) in the image. Tantric Buddhist consecrations involve placing consecrated objects such as scriptures and relics inside the

image. In East Asia, some images are consecrated by placing the cremated ashes and other relics of a deceased Buddhist master in a cavity in the image. The periodic reconsecration of the wooden image of the Hindu deity Jagannātha in Orissa also involves transferring a sacred object from the old image into a cavity in the back of the new one. These rituals show the overlap between icons and relics.

IMAGES AS DIVINE PRESENCE. All these rituals effect the transformation of the image from a humanly manufactured object into a receptacle or real presence of divinity. In the Mesopotamian case the image is understood to have been produced by the cooperation of humans and gods. In many traditions there are stories of images that either were created by divine beings, or else were spontaneously material incarnations of the deity him- or herself.

This dual character of the image, as at once humanly created and a body for the divine, is reflected in various ways in the rituals. In the Mesopotamian ritual priests use a wooden sword symbolically to cut off the hands of the artisans, whereas the artisans themselves swear an oath that the image was made not by them but by their craft deities. In the Buddhist ritual in Sri Lanka the act of painting in the eye of the image to open it is considered so dangerous that no one can look at the image during this process, and even the craftsman who performs the act must do it with a mirror. This would appear to indicate a powerful presence in the image, greater than anything within normal human experience.

It is often not clear whether the image is a representation of a particular deity, or is the deity itself. The language of hymns and rituals, as well as stories concerning images, allow for both interpretations. Some paintings of images clearly depict an image in a temple. In others it is unclear if the painter has depicted the deity or an image of the deity.

A further ambiguity seen in consecration rituals is whether the image is the sole abode of a particular deity, or the abode of a deity who equally resides in other images. While the language and actions of the consecration ritual usually indicate that the image has now become a permanent abode of the divine, the language and actions of some daily rituals simultaneously indicate an understanding that the ritual practitioner invokes the deity into the image and then dismisses the deity at the conclusion of the ritual. Most images are the subject of annual or periodic rituals of purification and renewal. In some cases these rituals consist of a set of purifications; in others the image itself is repaired, reornamented, or even, as in the case of the Jagannātha, entirely refabricated.

In some traditions, such as the Mesopotamian, Egyptian, Hindu, and Mahāyāna Buddhist, there is little or no theological problem caused by positing the presence of the deity, either in whole or as a partial incarnation, in the image. But other traditions deny this possibility. In Theravāda Buddhism and Jainism the Buddha and the Jina, respectively, are understood no longer to be present in this world in a tangible

sense. These traditions engage in more complicated explanations of what, if anything, is present in the image, and tie the presence to the intentions and actions of the Buddha or Jina several thousand years ago. Christian theology also denies the possibility of *real presence* in an icon or image, reserving this (according to the Eastern Orthodox, Catholic, and some Protestant traditions) to the sanctified bread and wine in the Eucharist. A careful analysis of rituals and stories in traditions that theoretically deny presence, however, shows that many people act *as if* there were a divine presence in the image, so scholars must beware placing too much emphasis on theological arguments of absence.

Images and miracles. Stories of images frequently recount miracles. Some miracle stories account for the existence of the image itself, as the image or deity arranges for a person, animal, or deity to find or receive the image and install it for worship in a shrine. For example, in the early sixteenth century the image of Śrīnāthjī that had earlier appeared from within the sacred Mount Govardhan summoned the Vaiṣṇava saint Vallabhācārya (Vallabha, 1479–1531) and revealed its true identity, and in 1672 the image, which had been removed from the danger of spoilage by the Mughal rulers, indicated its eventual home in Nathdwara by preventing the bullock cart carrying it from leaving that site. In 1531 in Guadalupe the Virgin Mary appeared to the Mayan Indian peasant Juan Diego and left an image of herself on a cloth. In circumstances where there is extensive iconoclastic opposition to and destruction of images, many miracle stories relate how images saved themselves from destruction and thereby verified the theological correctness of the cult of images. Miracle stories also recount ways that images have saved cities and towns from hostile armies. The *Hodegetria* icon of the Virgin Mary was displayed by the emperors of Constantinople to help protect the city from invaders. Politically and socially important images also become the source of attention for the state's enemies. The *Hodegetria* was sought by the Venetian conquerors of Constantinople in 1204, and later cut into four pieces by the Turkish conquerors of the city in 1453. While the Venetians were unable to locate and seize the *Hodegetria* icon, they did seize another icon of Mary, the *Nicopeia*, which had been on the chariot of the defeated commander of the Greek army, and transported it and many other images back to Venice for installation in the cathedral of San Marco.

Most miracle images come to have a distinct personality that is indicated by its name. Examples of these are the Emerald Buddha in Thailand, the Zenkōji icon of Amida, Japan, the Jain Śāṅkheśvara Pārśvanātha in Gujarat, India, the Infant Jesus of Prague, the *Hodegetria* icon of the Virgin Mary, and the Vladimir Mother of God icon now in Saint Petersburg, Russia. These images are readily identifiable to members of the religious community. Replicas of these images are known by the same name, and the spread of such images creates a *replication cult*. Replication cults appear to be most prominent in Buddhism, Jainism, and Christianity. As Hin-

duism has spread outside of India in recent decades, many temples built in Europe and the United States represent a replication cult, such as the temple outside of Pittsburgh, Pennsylvania, that replicates the temple of Venkatesvara in Tirupati in southern India. Related to replication cults is the widespread practice of pilgrims obtaining inexpensive replicas of icons to take home and place in a household shrine. These reproductions tend to be two dimensional more often than three dimensional, and rarely undergo formal consecration rites. Just as consecrated images exhibit an ambiguity concerning whether they are the sole and unique abodes of particular deities, so also replication images at once share in the presence of the original and point away from themselves to that unique and easily identifiable original.

Images and religious conversions. Images often play an important role in the spread of religions and in conversions. Chinese texts call Buddhism “the teaching of the [Buddha] images” (*xianjingiao*). The introduction of Buddhism into the Korean kingdom of Silla in the early sixth century was effected by a miracle, as the severed head of a pro-image martyr spouted a fountain of pure white blood. The introduction of Buddhism into Japan later in the same century was also effected by a miracle, as an image that opponents had thrown into a canal arranged for a commoner to rescue it and in return revived his dead son. Images have also proved to be bridges between different religious communities, such as the Virgin Mary of Guadalupe in Mexico, of whom there were different but overlapping understandings by the indigenous Mayans and the conquering Spaniards.

RITUAL USES OF IMAGES. Consecrated images are the foci of many rituals. Viewing an image is itself an efficacious ritual in many traditions, which leads to the elaborate ornamentation of images. In many cases, such as Hindu, Jain, and Christian images, the ornamentation is so extensive that it almost totally covers the image, so the image’s identity is established more by the ornamentation than by the underlying “original” image. In Hinduism, Buddhism, and Jainism images are offered flowers, incense, lamps, edibles, and other physical substances. In Hindu Vaiṣṇava traditions the deity is understood to consume the subtle essence of the offerings that are then returned to the person as *prasāda*, literally “divine grace.” In contrast, Jain and Hindu *Śaiva* traditions explicitly restrict such transactions. Hindu, Buddhist, and Jain rituals also involve the anointing of images with water, milk, and other liquids in a ritual idiom that shares much with the consecration of kings. In Christianity devotion to an image is usually expressed through kissing it and praying in front of it.

Rituals can differ according to the deity symbolized or embodied by the image. In Jainism, the eight-part ritual offering (Sanskrit *aṣṭaparakāri pūjā*) is done only to images of the enlightened and liberated Jinās, whereas images of unliberated deities receive a different number of offerings. The Eastern Orthodox theologian Saint John of Damascus distinguished between veneration (Greek *proskinesis*, Latin *dulia*)

directed toward a saint, and worship (Greek *latreia*, Latin *latria*), which is appropriate only toward Jesus as God. This distinction was adopted by Catholic theologians, who added an intermediate rite of special veneration (*hyperdulia*) in which the Virgin Mary was named the Mother of God.

Image cults often involve processions, in which an important image is periodically taken out of the shrine and processed around the village or neighborhood. In some cases it is the central image of a shrine that is processed. In other cases the main image remains permanently in the shrine, and a portable image stands in for it in the procession. Processions spread the power and blessings of the image throughout the geographical area encompassed by the procession. In traditions such as Hinduism before Indian independence, in which entry to many temples was prohibited to some lower castes, the procession also allows access to the image on the part of the total population.

Vows taken before an image may have the same binding significance as those taken before the deity or a religious leader. In the Jain tradition, for example, a person should be initiated into monkhood by another monk, but several twentieth-century Digambara monks initiated themselves in front of Jina images. Shingon Buddhist monks in medieval Japan also performed self-ordinations in front of Buddha images to start new monastic lineages. Buddhist monks in many traditions perform rites of confession in front of Buddha images.

COMMISSIONING AND MAKING OF IMAGES. The most obvious reason people commission images for installation in shrines is devotion to and faith in the deity represented by the image, although in the case of replication cults this devotion may be directed to the particular icon as much as to the deity. This devotion may be a generalized response to the deity on the part of the donor, or it may be motivated by a request from the deity or other miraculous event. In many traditions the donation of images earns religious merit for the donor. Images are donated as the result of vows, in which a person pledges to donate an image in response to the fulfillment of a particular desire for health, success, or other form of well-being. Images can be donated to enhance the social prestige of the donor. This intention is often underscored by an inscription or other testimonial, such as inclusion of a portrait of the donor in the painting or sculpture, that publicly links the image to the donor’s name.

In many cultures images are made by hereditary craftsmen. In India there is no requirement that the craftsmen be of the same religious tradition, so the Vaiṣṇava stone carvers of Jaipur also make images for *Śaivas*, goddess worshipers, and Jains, and in some places in India nonconsecrated images are even made by Muslims. In other traditions there is an expectation that the craftsman be within the same tradition, for the making of a religious image, especially one to be consecrated, requires a higher degree of moral purity or spiritual insight than making a nonreligious image. In some Tibetan Tantric esoteric traditions the painters of *thangkās* are expect-

ed to have taken formal initiation in the cult of the deity. Old Believers of the Russian Orthodox Church said that the only way to be sure that an icon was not actually an icon of the antichrist was to insist that icon painters live in a state of near-monastic spirituality and simplicity. Painters of Greek Orthodox icons are also expected to be in a condition of heightened reverence, for icon painting is understood not as a form of artistic self-expression, but as an act in imitation of the first image of Christ, the icon “made without hands” (Greek *acheiropoietos*) or cloth true portrait (Greek *mandylion*) made when Christ imprinted the features of his face on a cloth.

ICONOCLASM AND JUSTIFICATIONS OF IMAGES. Traditions that devote extensive theological and ritual attention to images almost always generate countermovements in criticism or opposition to images. The destruction of images (iconoclasm) is oftentimes accompanied by criticisms of other aspects of the material culture of the religion, of priestly hierarchies with special prerogatives and extensive powers, and of theological decentralizing through either polytheism or the development of cults of multiple subsidiary deities or saints. In some cases, as in the critiques of the Ārya Samāj in Hinduism, the Sthānakavāsīs and Terāpanthīs in Jainism, and Lutherans in Christianity, iconoclasm is nonviolent and aims at convincing people to ignore and eventually reject images. In other cases, such as the Christian Iconoclastic Controversy of the eighth and ninth centuries and the Calvinist Reformation, the iconoclasm was more violent, with extensive destruction of images. Iconoclastic movements also lead to the development of self-conscious defenses of images and the cult of images. Saint John of Damascus and Saint Theodore of Studion articulated the Orthodox Christian theology of the image during the Iconoclastic Controversy, the Council of Trent confirmed the Catholic theology of images in response to the Protestant Reformation, and Mūrtipūjaka Jain thinkers developed their philosophy of images in response to the Sthānakavāsī critiques. Iconoclastic opposition to images can also come from outside a tradition. It can be physically nonviolent, as in the case of the Christian polemics against Hindu idols in nineteenth- and twentieth-century India, or it can result in the violent overthrow of images as witnessed most recently in 2001 by the destruction of the Buddha images at Bamiyan in Afghanistan by the Taliban.

IMAGINATION SEE AESTHETICS; ART AND RELIGION

IMAMATE. The Arabic term *imam* means in general "leader" or "master." In nontechnical usage it is often applied to a leading authority in a field of scholarship or to the leader of a community. As a technical term in Islamic law and theology, it refers to the legitimate supreme leader of the Muslim community and also to the leader of the ritual prayer (*ṣalāt*). The imamate, as the office of imam, will be dealt with here in these two technical senses.

SUPREME LEADERSHIP OF THE MUSLIM COMMUNITY. The question of leadership, in theory and practice, has historically evoked different responses within the different branches of Islam.

The Sunnīs. Representing the great majority of Muslims, the Sunnīs have generally viewed the historical caliphate as the legitimate leadership of Islam after the prophet Muḥammad. For them, the imam is thus identical with the ruling caliph. Actual rule, even if reduced to a minimum, is indispensable for the legitimacy of the imam. Throughout history, however, the Sunnīs were primarily concerned with

preserving the unity and solidarity of the Muslim community under a single imam and were prepared to compromise on the ideal of his legitimacy and justice. Sunnī theory generally held that the true and exemplary caliphate, meaning the vicegerency of prophecy (*khilāfat al-nubūwah*) was restricted to the first four, or "Rightly Guided" (Rāshidūn) caliphs, Abū Bakr, 'Umar, 'Uthmān, and 'Alī. This view was embodied in a well-known *ḥadīth* attributed to Muḥammad, according to which the caliphate was to last for only thirty years after his death and to be followed by mere autocratic kingship (*mulk*). Sunnīs considered the first four caliphs to be the most excellent of humankind after Muḥammad and thus entitled to his succession as leaders of the community.

This judgment did not apply, however, to the later caliphs, many of whom were seen as unjust and impious. While the later caliphate was thus recognized to be imperfect, Sunnī doctrine viewed it still as a divinely sanctioned and indispensable institution and stressed the obligation of every Muslim to obey and actively support the established imam, be he just or oppressive, pious or immoral, except in violation of the religious law. Conservative traditionalist opinion, especially that of Ḥanbalī jurists, virtually equated power and legitimacy, affirming the validity of the imamate gained by usurpation. In their view, the imamate could become binding without any act of recognition by the Muslim community. The only prerequisite for the rightful imam was that he be a Muslim of the Quraysh, the tribe of Muḥammad.

A less radical view of the caliphate was taken by another current of Sunnī thought, represented in particular in the legal school of al-Shāfi'ī. The Shāfi'ī jurists did not confine the legitimate imamate to the most excellent of the community and allowed that a less excellent candidate might be chosen, especially in order to avoid discord. They considered the late caliphate essentially as a legitimate continuation of the ideal rule of the four Rightly Guided caliphs, to be judged by the standards they had set. On this basis they elaborated a comprehensive legal doctrine concerning the qualifications, election, rights, and duties of the imam. Their activity reached its peak with al-Māwardī (d. 1058), whose book *Al-aḥkām al-sulṭānīyah* (The statutes of government) came to be widely regarded as an authoritative statement of classical Sunnī teaching on the imamate.

Classical theory. Classical Sunnī theory considered the imamate as an institution necessary for the legitimacy of all acts of government. Thus it held that the Muslim community was under the obligation to set up an imam as its supreme head at all times. It allowed for only a single imam at any time and considered rival caliphs, even if they were in clear control of part of the Islamic world, to be illegitimate. The imam was to be of Qurayshī descent, male, major, free, physically fit, and capable to execute the political and military duties of the office. He was to have the knowledge of the religious law required for the judgeship and probity as required for legal testimony. The imam could be either appointed by his predecessor or elected. These alternative modes of invest-

ment were based on the fact that the second caliph, 'Umar, was appointed by his predecessor, Abū Bakr, but, before his death, set up an electoral council (*shūrā*) of six prominent companions of the Prophet to choose his successor. The later caliphs in most instances appointed their successors, commonly their sons.

In the case of election, the law considered any Muslim of probity, discernment, and with knowledge about the nature of the office qualified to act as an elector. The number of electors required to make the election binding on the whole Muslim community was generally held to be small, and a common view considered a single elector sufficient. The legal doctrine here reflected the fact that in the absence of an appointed successor a handful of powerful men were usually able to impose a successor of their choice. The election was not intended to be a free choice between candidates, but a selection of the "most excellent" in religious terms. The election of the "less excellent" was viewed as permissible only for proper cause.

The imamate became legally invalid through loss of liberty and of mental or physical fitness. Many Shāfi'ī authorities also held it to be forfeited by loss of probity through immoral conduct, injustice, or heterodoxy; this view was denied, however, by others and by Ḥanbalī and Ḥanafī opinion in general. In practice there was no way to apply this rule. Sunnī law defined the duties of the imam as: guarding the faith against heresy, protecting the peace in the territory of Islam, defending it against external enemies, conducting *jihād* against those outside the territory of Islam resisting its supremacy, enforcing law and justice between disputants, administering punishments (*ḥudūd*) under the religious law, collecting legal alms and other taxes and the fifth of war booty due to the imam, spending revenue according to the provisions of the law, and appointing trustworthy and qualified officials in delegating his authority.

Subsequent developments. The overthrow of the Abbasid caliphate in Baghdad by the Mongols in 1258 confronted Sunnī legal theory with a new situation. The Abbasid shadow caliphate set up by the Mamluk sultans in Cairo was generally ignored. After the Ottoman conquest of Egypt in 1516, the claims of the Ottoman sultans to the caliphate gained some popular support. Sunnī jurists, however, mostly considered the imamate to be in abeyance. Relying on the legal principle of necessity (*darūrah*), they maintained that because the actual exercise of power was essential to the imamate, its functions had devolved upon the rulers of the Muslim world, whoever they were. The formal abolition of the Ottoman sultanate (1922) and caliphate (1924) by the Turkish National Assembly has led to a renewed interest in the question of a supreme and universal leader of Islam. Although some modernists have denied the need for the imamate, others among them, as well as fundamentalists, have advocated its restoration. Here the ideal model is the caliphate of the four Rightly Guided caliphs rather than the later dynastic caliphate. Modernists have stressed in particular the

principle of rule by consultation (*shūrā*), often seen to imply the need for an elected parliamentary council to advise the supreme ruler, and the principle of election rather than appointment by the imam's predecessor.

The Shī'ah. While Sunnī Muslims were essentially motivated to back the actual holder of supreme power as the guarantor of the unity of the Muslim community, the Shī'ah have primarily emphasized the principle of legitimacy of the imam, which they see vested in the family of the prophet Muḥammad. The majority of Shī'ī imams, except among the Zaydiyyah, never held political power, though the Shī'ah considered them solely entitled to the supreme leadership of the Muslim community and viewed the historical caliphs, with the exception of 'Alī, as illegitimate usurpers. Partly as a result of their lack of political power, the Shī'ah have tended to endow their imams with great religious authority and to place the imamate at the center of religion.

Twelvers. Twelver Shī'ī doctrine bases the imamate on the permanent need for a divinely guided, infallible ruler and teacher of religion. This need was recognized through human reason rather than revelation. After the age of the prophets had come to a close with Muḥammad, these divinely guided leaders were the imams, beginning with Muḥammad's cousin and son-in-law, 'Alī. They were, like the prophets, fully immune from sin and error and shared the same function and authority, though they would not bring a new divine scripture because the Qur'ān was final. The imamate thus assumed the same religious significance as prophecy. Ignorance or disobedience of any of the imams constituted infidelity equal to ignorance or disobedience of the Prophet. For the Twelvers, the imamate is handed down by divinely directed designation (*naṣṣ*) of the successor. Thus the great majority of the companions of Muḥammad and the Muslim community at large had become apostates when they recognized Abū Bakr as the imam in place of 'Alī, who had been publicly designated by Muḥammad as his successor. After Ḥasan and Ḥusayn, the grandsons of Muḥammad, the imamate was to be transferred only from father to son among the descendants of Ḥusayn.

In 874 the death of the eleventh imam without apparent son caused a crisis that was eventually resolved by the affirmation that a son had been born to him and continued to live on earth, though in concealment (*ghaybah*) from humankind. The twelfth imam was identified with the eschatological Mahdi or Qā'im who is expected to appear before the end of the world and to rule it in glory. Because the twelfth imam is present on earth and may show himself to some of the faithful in person or in a dream, he is held to be essentially still able to fulfill his supreme function of conveying infallible divine guidance. His more practical legal duties and rights have either been assumed gradually by the Shī'ī 'ulamā' (religious scholars), who claim a general deputyship of the imam during his concealment, or remain in abeyance.

Twelver Shī'ī tradition ascribes to the imams numerous miracles and supernatural powers. They are described as hav-

ing complete command of all crafts and languages, including those of animals. Though they are not endowed with a natural knowledge of the hidden, God gives them knowledge of anything they wish to know: “what has been and what will be.” Because they inherit the knowledge of the prophet Muḥammad, they are perfectly informed of both the outer (exoteric) and the inner (esoteric) meaning of the Qurʾān. They are in possession of all revealed scriptures as well as books containing secret knowledge, including the *Sahīfah*, *Jafī*, *Jāmiʿah*, and the *Muṣḥaf* of Fāṭimah. They receive divine guidance from an angel who speaks to them and informs them, though unlike the messenger prophets, they do not see him.

The imams are endowed with the Holy Spirit. In numerous passages of the Qurʾān they are evoked by terms such as “the light of God,” his “witnesses,” his “signs,” those “firm in knowledge.” They are the “vicegerents” of God on earth and the “gates” through which he may be approached. In popular piety the privilege of the imams to intercede with God for the sinners of their community has always loomed large and has inspired the frequent pilgrimages of the faithful to their tombs. Later esoteric Twelver Shīʿī teaching, influenced by Ṣūfī and Ismāʿīlī thought, defined the permanent essence of the imamate as *walāyah*, the quality of a *walī*, “friend of God,” and as the esoteric aspect of prophecy. The imam was viewed as the initiator to the mystical truths.

Ismāʿīlīyah. When, after the sixth imam, Jaʿfar al-Ṣādiq, the Ismāʿīlīyah separated from the group developing into the Twelver Shīʿah, they retained the idea of a permanent need for a divinely guided, infallible leader and teacher but developed from it a cyclical view of the history of the true religion. For the Ismāʿīlīyah, prophetic revelation progresses through seven eras. Each of the first six is inaugurated by a “speaker prophet,” who brings a scripture with a law and is followed by a “silent fundament.” The fundament reveals the esoteric truth concealed in the scripture and is followed by seven imams in sequence, the seventh of whom rises in rank to become the speaker of the following era. The imam takes the place of the speaker prophet in guarding and applying the literal aspect of the revealed law, while his *ḥujjah* (“proof”), representing the rank below the imam in the hierarchy, succeeds the fundament in revealing the esoteric truths to the initiate.

In the sixth era, that of Muḥammad and Islam, ʿAlī was the fundament and Jaʿfar al-Ṣādiq’s grandson Muḥammad ibn Ismāʿīl the seventh imam from Ḥasan. As such he was expected, after his imminent advent from concealment, to rise in rank to become the seventh speaker prophet, who was identified with the Mahdi and Qāʾim. This early Ismāʿīlī expectation was modified in the tenth century by the rise of the Fatimid caliphs, who claimed to be imams. Some Ismāʿīlī backers of the Fatimid caliphate recognized the first Fatimid caliph as the Mahdi, while others continued to expect the early return of Muḥammad ibn Ismāʿīl and considered the Fatimids his lieutenants. As Fatimid rule continued,

however, these eschatological expectations receded, and the Fatimid caliphs were viewed as a continuous line of imams within the era of Islam.

After the fall of the Fatimid dynasty, the Ismāʿīlīyah survived mainly in two branches. The Ṭayyibīyah recognized al-Ṭayyib, an infant son of the Fatimid caliph al-ʿĀmir about whose fate nothing is known, as their imam and denied his death. They hold that al-Ṭayyib, though in concealment, remains in touch with his community and will return. He is not identified, however, with the eschatological Qāʾim. In later Ṭayyibī gnostic thought, the imam is described as having both a human nature (*nāsūt*) and a divine nature (*lāhūt*). His human, physical nature, also called the “camphoric figure,” is composed of the vapors that arise from the souls of the faithful three days after their death. The divine nature is described as a light temple formed by the assembly of light points of the souls of the faithful and the teaching hierarchy. This light temple will, after the death of the imam, rise to the horizon of the Tenth Intellect, the demiurge, where it will assemble with the temples of the other imams to form the immense light temple of the Qāʾim.

The Nizārī branch recognized Nizār, a son of the Fatimid caliph al-Mustaṣṣir, as their imam and has continued to adhere to a line of present imams leading, for the great majority, to the Aga Khans. The proclamation of the resurrection (*qiyāmah*) in 1164 and the subsequent return to an age of concealment brought major reforms of the esoteric doctrine of the imamate. The imams were now raised in rank above the prophets. As a potential Qāʾim, each imam was held to have the authority to suspend or apply the religious law as the circumstances required. The imam was in his spiritual essence defined as a manifestation of the divine word or command, the cause of the spiritual world. The faithful attain spiritual birth, or resurrection, through recognition of the essence of the imam. In the era of concealment, spiritual union with the imam was restricted to his *ḥujjah*, who was his gate for the faithful and the sole dispenser of spiritual truth.

Zaydīyah. Unlike other Shīʿī Muslims, the Zaydīyah do not consider their imams divinely protected from error and sin and do not recognize a hereditary line of imams. They hold that after the first Shīʿī imams, ʿAlī, Ḥasan, and Ḥusayn, who were appointed by the prophet Muḥammad through a descriptive designation, the imamate belongs to any qualified descendant of Ḥasan or Ḥusayn who rises against the illegitimate rulers. Apart from his descent, the legal qualifications of the imam are substantially the same as in Sunnī law. Special emphasis is placed, however, on religious learning, competence to render legal judgment, moral integrity, and courage. Zaydī imams have generally been scholars of rank and authors of the most authoritative Zaydī religious works. The imamate becomes legally binding upon the issuance of a formal call to allegiance (*daʿwah*) and rising against illegitimate rule, not through election or appointment by a previous imam. After his call to allegiance, recog-

nition and active backing of the imam is incumbent upon every believer. The imamate is forfeited by loss of any of the qualifications, in particular by moral offenses. According to the prevalent doctrine, only the most excellent claimant is entitled to the imamate, and if a more excellent candidate arises to claim it, the excelled imam must surrender it to him. This has been disputed, however, by some later authorities. In practice rival claims to the imamate have often divided the allegiance of the Zaydī communities, both in Yemen and in the coastal regions south of the Caspian Sea.

Although in Zaydī legal theory there must always be a qualified candidate for the imamate, the Zaydī imamate has often been in abeyance for prolonged periods. The list of recognized imams has never been definitely fixed, though there is consensus on many of them. Many Zaydī ‘Alīd rulers did not claim the imamate or were not recognized as imams by later Zaydī opinion because they did not fulfill the requirements, especially that of religious learning. These were often considered as “restricted” imams, or “summoners” (*du‘āt*), with limited authority.

Khārijīs. Whereas the Shī‘ah historically based their repudiation of the Sunnī caliphate on the principle of legitimacy, the Khārijīs founded their opposition on an uncompromising concept of the justice and moral integrity of the imam. In Khārijī doctrine the imam loses his legitimacy by any violation of religious law and must be removed, by force if necessary. The unjust or immoral imam and his supporters are to be treated as infidels unless they repent. ‘Uthmān and ‘Alī are viewed as initially legitimate imams who became infidels by their illicit acts and thus were rightfully murdered. Any Muslim who does not dissociate himself or herself from them and their supporters shares their state of infidelity. Likewise any Muslim who does not affirm solidarity with just imams such as Abū Bakr and ‘Umar is an infidel. The Khārijīs also unanimously rejected the elitist Sunnī doctrine restricting the imamate to the Quraysh. They held that any qualified Muslim, even of non-Arab and slave origin, was eligible. An exceptional view extended this egalitarian principle to women as well. The other qualifications and functions of the imam were similar to Sunnī doctrine, with special emphasis on the Qur’anic duty of “commanding what is proper and prohibiting what is reprehensible” and on the imam’s leadership of the *jihād* against non-Khārijī Muslims.

Only the most moderate sect of the Khārijīs, the Ibādīyah, survived the first centuries of Islam. The Ibādīyah took a more accommodating view toward non-Khārijī Islam at large, and their doctrine came to recognize different types of imams corresponding to the four states in which the community of the faithful could face its enemies. These include the state of manifestation, when the community was strong enough to overcome the opponent; the state of defense, when it could merely hope to ward off the enemy; the state of self-sacrifice, when a small group of the faithful seeking martyrdom would choose to attack a powerful enemy; and the state of concealment, when the faithful were forced to

live under the rule of the opponent and to practice dissimulation. Only the imam of the state of manifestation was entitled to exercise all the functions of the imamate.

LEADERSHIP OF THE RITUAL PRAYER. The ritual prayer, which is obligatory for every Muslim five times daily, may be performed individually or in group with a leader who is called the imam. The same applies to several special prayers, which are merely recommended, on the occasion of festivals and solar or lunar eclipses, prayers for rain, and supererogatory and funeral prayers. In most of these cases group prayer, preferably in a mosque, is the recommended form whenever possible. The congregational Friday prayer, which is generally obligatory for those in easy reach of a congregational mosque (*jāmi‘*), can only be performed in group with an imam.

The imam must face the *qiblah*, the direction toward Mecca. In the mosque he stands in front of the *mihṛāb*, or prayer niche, which indicates this direction. In the early time of Islam a staff or lance was placed in the ground before him. The congregation stands in rows behind the imam; no one is permitted to be in front of him. If there is only a single worshiper following the prayer, he may stand at the imam’s right, and a second one may stand at his left. The members of the congregation must strictly follow the imam in every movement and recitation. While the imam recites in a loud voice, however, they should generally not be heard. If the congregation is too large for everyone to see and hear the imam, special “conveyors” (sg., *muballigh*) may be employed to repeat his *taḳbīrs*, marking the transition to the next phase of the prayer, for the worshipers in the back rows or outside the mosque.

The obligation to imitate strictly the movements of the imam applies even if a worshiper belongs to another legal school prescribing different prayer rituals. While this rule has been generally accepted among the four Sunnī schools, there have at times been problems. Some Ḥanafī authorities held that raising the hands during the bowing (*rukū‘*) and lifting the head, as practiced by the Shāfi‘īyah and others, invalidates the prayer and ruled that a Ḥanafī must not pray behind a Shāfi‘ī imam. This matter provoked friction between the two schools for centuries.

A group praying outside a mosque may generally choose its own imam. Preferably he should be the most worthy among them, with particular consideration given to probity, knowledge of Qur’anic texts for recitation during prayer, knowledge of the ritual, and freedom from speech defects. While a woman may act as prayer leader only for other women, the imam may be a minor boy, a slave, or a moral offender among men and women alike. Prayer led by an imam with a speech defect is invalid. In a private home, the owner is most entitled to lead the prayer even if otherwise more worthy men are present.

Mosques have generally appointed official imams. Whenever the official imam or a substitute appointed by him

is present, he is entitled to lead the prayer. In the congregational mosques or others maintained by the caliph, his governors, or, in modern times, the government, the imam is appointed by them. In private mosques maintained by individuals or local communities, the imam is chosen by the neighborhood. Once chosen he cannot be removed except for cause. The imam has usually the right to choose and direct the muezzin, who makes the call to prayer.

The imam of the Friday congregational worship may be appointed separately from the imam of the daily prayers. He is normally also the preacher (*khaṭīb*), who delivers the official sermon (*khuṭbah*) with the prayer for the ruler before the Friday prayer. In early Islam the Friday congregational prayer in particular was led by the caliph himself in the capital and by his governors in the provincial capitals. Later they generally deputed imams. The Friday prayer remained closely associated with government authority, however, and some of the legal schools held it to be invalid without the presence of the supreme imam (caliph) or his appointed representative. In Twelver Shiism, for instance, the Friday worship has been generally held to be in abeyance in the absence of the rightful supreme imam. Only when the Safavids established a Shi'ī regime in sixteenth-century Iran did the matter become controversial, and some Shi'ī jurists maintained that Friday worship was obligatory in the presence of a qualified legal scholar. Today the Friday prayer is performed among the Twelver Shi'ah, though not as widely as among Sunnīs. Sunnī concern for maintaining the unity of Islam by backing the established rulers, whatever their moral failings, found expression in the affirmation contained in many Sunnī creeds that every Muslim must "pray behind every imam, be he righteous or immoral." The Shi'ah and Khārijīs generally reject this attitude and prohibit prayer behind an imam who is known to be either immoral or heterodox.

BIBLIOGRAPHY

There is no comprehensive study of the imamate. The institutional development of the caliphate is analyzed by Thomas W. Arnold in his *The Caliphate* (Oxford, 1924); the second edition contains a chapter on the abolition of the caliphate and its aftermath by Sylvia G. Haim (New York, 1965). See also Emile Tyan's *Institutions du droit public musulman* (Paris, 1954–1957), volume 1, *Le califat*, and volume 2, *Califat et sultanat*. The most authoritative medieval treatise on the Sunnī (Shāfi'ī) legal doctrine of the imamate, al-Māwardī's *Kitāb al-aḥkām al-sultānīyah*, has been translated into French by Edmond Fagnan, as *Les statuts gouvernementaux* (Algiers, 1915). Modernist views are discussed by Malcolm H. Kerr in his *Islamic Reform: The Political and Legal Theories of Muḥammad 'Abduh and Rashīd Riḍā* (Berkeley, Calif., 1966) and by Henri Laoust in the introduction to his *Le califat dans la doctrine de Rašīd Riḍā* (Beirut, 1938), which contains the translation of a major work on the subject by a conservative modernist.

Twelver Shi'ī doctrine is described by Dwight M. Donaldson in *The Shi'ite Religion* (London, 1933), and later esoteric teaching by Henry Corbin in *Histoire de la philosophie islamique*, vol. 1 (Paris, 1964), pp. 53–109. For Ṭayyibī esoteric doctrine, see the analysis and annotated translation of a typical Ṭayyibī treatise on the subject in chapter 4 of Henry Corbin's *Trilogie ismaélienne* (Tehran, 1961). Nizārī doctrine after the *qiyāmah* is described by Marshall G. S. Hodgson in *The Order of Assassins* (1955; reprint, New York, 1980), pp. 160–175. Rudolf Strothmann's *Das Staatsrecht der Zaiditen* (Strasbourg, 1912) discusses Zaydī legal doctrine and practice. Khārijī doctrine is analyzed by Elie Adib Salem in *Political Theory and Institutions of the Khawārij* (Baltimore, 1956), especially in chapter 4. For details of the legal rules concerning the imamate of the ritual prayer, see chapter 9 of al-Māwardī's work cited above and *Nawawī, Minhaj et Talibin: A Manual of Muḥammadan Law according to the School of Shāfi*, translated by E. C. Howard (1914; reprint, Lahore, 1977), pp. 42–69.

WILFERD MADELUNG (1987)

ĪMĀN AND ISLĀM. *Islām*, a noun derived from the verb *aslama* ("to submit or surrender [to God]"), designates the act by which an individual recognizes his or her relationship to the divine and, at the same time, the community of all of those who respond in submission. It describes, therefore, both the singular, vertical relationship between the human being and God and the collective, horizontal relationship of all who join together in common faith and practice.

In its communal aspect *islām* has come to be the commonly accepted term for the religion of the followers of the prophet Muḥammad and today claims many millions of adherents. As the personal act of response to the oneness of God and his commands *islām* often has been viewed as coordinate with another term basic to Muslim theology. This is *īmān*, most commonly understood as faith, from the verb *amana* ("to be secure, to place one's trust [in God]"). While *islām* as a verbal noun appears only eight times in the Qur'ān, *īmān* is found over five times as often in the sacred scripture.

QUR'ANIC CONTEXT. The Qur'ān as understood by Muslims is not a theological document per se, although it does reveal something of the being and will of God. It is rather a record of the revelations to the prophet Muḥammad that details the ways in which men and women of faith are to respond to the fact of divine oneness. It also sets forth the specific ways in which they are to conduct their daily lives in preparation for the reality of the final day of judgment and recompense. Terms such as *islām* and *īmān* therefore are not defined and analyzed in the Qur'ān. In some instances they are apparently interchangeable in meaning, and in others Qur'anic usage seems to suggest that the two have different emphases, particularly as they relate to works. In one place only (sura 49:14) is a clear discrimination between *islām* and *īmān* implied.

Here a distinction is drawn between the verbal acknowledgment of *islām* by the tongue and the *īmān* that has entered the heart. The suggestion that *islām* is the outward sign and *īmān* the inward, however, runs counter to the general understanding of the Qurʾān that they are essentially synonymous and that they both designate the religious response by which one heeds the message of God's oneness and thereby escapes the eternal retribution of the Day of Resurrection.

HADĪTH. Many kinds of references to *islām* and *īmān* are to be found in the collections of *ḥadīth*, the narratives or "traditions" that record the community's memory of the sayings and actions of the prophet Muḥammad and his companions. Individual traditions often fail to suggest a distinction between *islām* and *īmān*. The Prophet is sometimes quoted as having indicated that the essentials of *islām* are the Shahādah, the twin testimonies to the oneness of God and the prophethood of Muḥammad, as well as the other duties constitutive of formal *islām*, with no specification of the components of faith. More often, however, the reports seem to imply that the terms connote at least different aspects of the same response, if not two separate kinds of responses.

One particularly interesting narrative found in a range of renditions presents the Prophet defining *islām* as clearly distinct from *īmān*. In the best-known version the story is told about a stranger with a beautiful face, black hair, and a white robe (usually understood to be the angel Gabriel) who joins the Prophet and a group of his companions and asks "What is *islām*?" (or, in other versions, "Tell me about *islām*"). The Prophet answers that *islām* is the performance of certain duties. The specifics of these duties differ in the various renditions of this *ḥadīth*, but the most commonly cited are witnessing that there is no god but God and that Muḥammad is his Messenger (*shahādah*), submitting to God with no association of anything else, performing the prayer ritual (*ṣalāt*), paying the alms tax (*zakāt*), observing the Ramaḍān fast (*ṣawm*), and making the pilgrimage (*ḥājj*). If the first two of these are combined, the list then reflects the elements that commonly have been accepted in Islām as the five duties that constitute the "pillars" (*arkān*) of the individual Muslim's religious responsibilities.

After this enumeration the stranger assures the Prophet that the definition is correct. He then goes on to ask about *īmān* and is told that it consists of faith in the following (again differing somewhat according to the several versions): God, his angels, his books (or book), his messengers (or messenger), the resurrection, the garden and the fire, and other eschatological realities. Though less commonly classified than the *arkān*, the elements in this list generally are identified as the key components of the creeds that have been developed by members of the Muslim community. Several versions indicate that after thus defining *islām* and *īmān* the stranger asks the Prophet, "If I do that am I a *muslim* and a *mu'min*?" to which the Prophet responds "Yes."

The continuation of the story includes commentary on *iḥṣān*, a third element beyond *islām* and *īmān*, which the

Prophet says is the state of being perfected and serving God as if he were always before your eyes. From the structure of the narrative it is clear that the discussion was intended to suggest degrees of religious response, with *islām* as the first and most basic and *iḥṣān* as the last and highest. This kind of ranking is supported by another commonly cited narrative in which the Messenger of God says that *islām* is external while *īmān* belongs to the heart. For reasons that are not entirely clear, scholastic theology (*kalām*) did not generally develop the concept of *iḥṣān* but centered its subsequent discussions primarily on the first two terms.

Other *ḥadīths* seem to suggest that faith is a component element of *islām*. When asked about *islām* on one occasion the Prophet is said to have replied, "Witness that there is no god but God and that I am the Messenger of God, and have faith in all foreordinations, their good and evil, their sweetness and bitterness." On another occasion, the Prophet says that the more virtuous *islām* is *īmān*, which consists of faith in God, his angels, his books, his messengers, and the resurrection. Here *īmān* becomes a kind of subdivision of *islām*, with the most virtuous *īmān* said to be the emigration (Hijrah) and so on through a series of subcategories. In several traditions *islām* seems to consist of *īmān* plus works, as when the Prophet says that one should say "I have faith" and walk the straight path.

THEOLOGY. The respective definitions of *islām* and *īmān* became increasingly important in the early Muslim community as the nation of Islām grew through great numbers of conversions, and its members early on began to struggle with the question of who was or was not a Muslim. In a variety of ways, and for political as well as theological reasons, sects, schismatic groups, individual thinkers, and schools of theology adopted positions by which they tried to determine membership in the Islamic community. To this end clearer and firmer distinctions came to be drawn between *islām* and *īmān*, and the various groups in the young Muslim community often defined their positions according to those distinctions.

Khārijīs. Theological speculation is often said to have begun with the political movement of the Khārijīs, the earliest of the Muslim sects. It was, however, a movement not of passive reflection but of active involvement in the effort to purify Islam. As decades passed after the death of the Prophet, some began to feel that those in power were betraying the basic understanding of the faith. All the members of the community were being called *mu'minūn* ("persons of faith") regardless of the degree of their piety and their adherence to the essentials of Islam. The Khārijīs, in their zeal to ensure that the Muslim community was led by those most qualified in matters of faith and obedience, focused attention on the question of who is a true *muslim/mu'min* and who is a *kāfir* (best defined not as unbeliever or infidel but as one who actively rejects the will of God). *īmān* and *islām* were seen by the Khārijīs as essentially synonymous: Both include verbal and intellectual assent as well as works and are in abso-

lute opposition to *kufir* (“rejection”). Rather than trying to define the *muslim/mu'min* the Khārijīs concentrated on the *kāfir* and adopted often ruthless means of condemning and in fact excommunicating such a person from the community.

Murji'ah. The sect known as the Murji'ah (lit., “those who postpone”) was politically and, on this issue, theologically opposed to the Khārijīs. This group felt that it is wrong to condemn a member of the community as a *kāfir*, no matter what his or her actions. Judgment of human conduct and final determination of one's state of punishment or felicity must be left in the hands of God, they said, postponed until the Day of Resurrection.

Gradually, however, this doctrine came to mean for them not simply the postponement of judgment. In addition, they gave works a place of secondary importance behind faith by saying that good works are not a necessary indication of faith. This was in distinction to the Khārijīs, who stressed the importance of outward acts of piety in conformity with God's laws. The Murji'ah thus became the first in the Muslim community specifically to address the question of the internal structure of *īmān*. While there clearly were different schools of Murji'ah (al-Khaṭīb al-Baghdādī breaks them into three main groups, and al-Ash'arī identifies twelve different strands), their overall contribution to Islamic theology was in their identification of the nature of faith as separate from works and in their assurance for the *mu'min* of a place in paradise despite his or her failure to observe the laws of God.

Virtually all of the succeeding theoretical discussions about the nature of faith took as their starting point the issues and problems raised by the various schools of the Murji'ah. There was general acceptance of the Murji'ah thesis that the main elements to be considered in the understanding of *īmān* are affirmation (*taṣdīq*) and verbal acknowledgment (*iqrār*) of that affirmation. (While most later thinkers stressed the primary significance of *taṣdīq* as heartfelt affirmation, however, the Murji'ah rather understood affirmation as intellectual assent or knowledge.) While they assented to the importance of *taṣdīq* and *iqrār* as necessary constituents of *īmān*, the Murji'ah clearly rejected works.

As a consequence of this doctrine the Murji'ah, in clear opposition to the Khārijīs, did not believe that the quality of one's faith could be determined by the commission of sins, even major or grave sins. One school of the Murji'ah, the Karrāmīyah, went so far as to maintain that *īmān* consists strictly of the saying of the two *shahādahs*, the testimony of the oneness of God and the prophethood of Muḥammad, and involves neither affirmation nor works.

Later discussion. The debates between sects such as the Khārijīs and the Murji'ah were based on crucial questions of membership in the Muslim community and were therefore far from strictly intellectual issues. They were, in fact, quite often matters of life and death. As time passed, howev-

er, and the community began to stabilize after its initial growth, a stage was reached in which these kinds of questions were seen less as issues requiring decisive action and more as matters of intellectual engagement and decision. Thus the nature of *islām* and *īmān* continued to be discussed by the leading thinkers of the community.

One way of treating the relationship of, or distinction between, submission and faith is to consider which is the broader category under which the other is subsumed. Not surprisingly, different Muslim interpreters and schools of theology have reached different conclusions, often based on traditions from the Prophet such as those cited above.

If one understands *islām* as consisting of the five pillars or duties (the testimony, prayer, fast, alms tax, and pilgrimage) it is possible to argue that the first of these, witnessing to God's oneness and the prophethood of Muḥammad, can be considered an act of faith. In that way *īmān* is part of the larger category of *islām*. Thus Ash'arī theologians such as al-Bāqillānī (d. 1013), for example, concluded that all *īmān* is part of *islām*, but not all *islām* is part of *īmān*. Al-Ash'arī (d. 935) himself said that *islām* is wider than *īmān* and that therefore not all the former is part of the latter.

The later Ḥanbalī thinker Ibn Taymīyah (d. 1328) carefully developed another way of seeing this relationship in his analysis of the *ḥadīth* in which the Prophet seems to rank *islām*, *īmān*, and *iḥṣān*. Because of the very ranking, he said, *iḥṣān*, while characteristic of the most select number of the faithful, in fact connotes the most inclusive definition. That is, the person of faith (*mu'min*) must by definition be a submitter (*muslim*), and the person of perfection (*muḥṣin*) must therefore be both of the former. *īmān*, therefore, contains *islām*. Ibn Taymīyah's conclusion was more than academic. It is clear, he felt, that *islām* is an external act while *īmān* is a matter of the heart. For Ibn Taymīyah the Ash'arī conclusion that *islām* is wider than *īmān* implies that while all those who submit are persons of faith, not all who profess faith are *muslims*, a conclusion with which he totally disagreed. And in fact the majority Ash'arī view was that although faith can exist without *islām*, failure to do the works characteristic of *islām* is a grave sin. For Ibn Taymīyah, to have faith but not to do works of obedience is an impossible contradiction.

While some in the Muslim community continued to debate these and other theological issues, others turned to the task of systematizing the conclusions reached by thinkers within the various schools into creedal formulations. One of the most popular of the creeds over the centuries has been the *Sharḥ al-'aqā'id* of the Ḥanafī jurist al-Nasafī (d. 1143). The creed was later commented on by the Ash'arī scholar al-Taftāzānī (d. 1389). *īmān*, said al-Nasafī, is affirmation (*taṣdīq*) of that which the Prophet brought from God and confession (*iqrār*) of it. While acts of obedience may increase, faith neither increases nor decreases. Then, in a very interesting conclusion, he declares that *īmān* and *islām* are one; they are so, al-Taftāzānī explains, because obedience

(*idh'ān*) is the essence of both *islām* and *taṣdīq*, which, in al-Nasafī's definition, is *īmān*.

Despite the common element of obedience, al-Taftāzānī did not completely identify the terms but rather said that one cannot exist without the other. In the Ḥanafī creed *Fiqh akbar II* (Greater understanding II), attributed to Abū Ḥanīfah (d. 767) but probably written in the tenth century, *īmān* and *islām* share the common ingredient of submission and overlap so much that they are essentially interchangeable.

Qur'ān commentators analyzing the eight verses in which *islām* is mentioned all have stressed the essential component of submission, usually in relation to God's initiative. To the extent to which they have dealt with faith in relation to submission they have made it clear that *īmān* (most commonly defined as *taṣdīq* and *iqrār*) is identified in some clear ways with *islām*. The degree to which they have equated the terms, however, has varied considerably. In his monumental commentary on the Qur'ān, *Jāmi' al-bayān 'an ta'wīl āy al-Qur'ān*, al-Ṭabarī (d. 923) suggests a kind of bipartite *islām*. On one level is the verbal acknowledgment of submission by which one becomes part of the community of Islam, and on a deeper level is that *islām* that is in fact coordinate with the act of faith (*īmān*) and that involves the complete surrender of the body, the mind, and the heart. Fakhr al-Dīn al-Rāzī (d. 1209), in the *Mafāṭīḥ al-ghayb* (Keys to the mystery), insists that while the two are different in generality they are one in existence. If *islām* is not of the heart, he said, it cannot be called *islām*. Muḥammad Rashīd Riḍā, the twentieth-century Egyptian author of the *Manār* commentary, suggested a similar interpretation when he said that the true meaning of both *islām* and *īmān* is what he calls *īmān khāṣṣ*, interiorized faith, which is the only means of salvation. In this understanding *islām* and *īmān* converge in a single reality (*ḥaqīqah*).

Most Qur'ān commentators through the centuries, however, have seen *islām* and *īmān* as more distinct than al-Ṭabarī, al-Rāzī, or Rashīd Riḍā have. They admit that *islām* can have a purely external meaning, while *īmān* always involves confirmation of the heart. Although they differ in their attempts to interpret the distinctions between the terms, in no instance have they seen them as irreconcilable. And despite the variety of responses reflected in the works of theology, general usage of the terms *islām* and *īmān* has revealed some common understanding both of their respective definitions and of the ways in which these terms together express the totality of the Muslim's response to the being and will of God.

Works in Arabic

For a full collection of traditions from the prophet Muḥammad in which the terms *islām* and *īmān* are used, see Ibn Ḥanbal's

Musnad, 6 vols. (1895; reprint, Beirut, 1969). The earliest extensive Qur'ān commentary that analyzes the relation of the terms in their scriptural usage is Abū Ja'far Muḥammad al-Ṭabarī's *Jāmi' al-bayān 'an ta'wīl āy al-Qur'ān*, 30 vols. in 12 (Cairo, 1954–1968). Of the several creedal formulations dealing the juxtaposition of faith and submission in the thinking of the early Muslim community, one of the most popular is 'Umar ibn Muḥammad al-Nasafīyah's *Sharḥ al-'aqā'id*, with commentary by Sa'd al-Dīn al-Taftāzānī (Cairo, 1974). A rich treatment of the meaning of faith and its relation to submission is found in the *Kitāb al-īmān* of the fourteenth-century theologian Ibn Taymīyah (Damas-cus, 1961).

Works in Western Languages

Such basic works as A. J. Wensinck's *The Muslim Creed* (1932; reprint, New York, 1965) and Louis Gardet and M. M. Anawati's *Introduction à la théologie musulmane*, 2d ed. (Paris, 1970), are helpful for a general understanding of the significance of the *īmān/islām* discussions in the development of Islāmic theology. More specific treatments such as Helmer Ringgren's *Islām, 'aslama, and muslim*, "Horae Soederblomianae," vol. 2 (Uppsala, 1949), and "The Conception of Faith in the Koran," *Oriens* 4 (1951): 1–20, analyze Qur'anic usage of the terms. Toshihiko Izutsu provides an extensive study of the interpretation of *īmān* in the history of Islamic thought, with a chapter on its relation to *islām*, in *The Concept of Belief in Islamic Theology* (Tokyo, 1965).

JANE I. SMITH (1987)

IMMANENCE SEE TRANSCENDENCE AND IMMANENCE

IMMERSION SEE BAPTISM

IMMOLATION SEE SACRIFICE

IMPLICIT RELIGION. In the age of secularization and debate within the social sciences on how to approach the religious factor, two trends have intersected. One proclaims a progressive disenchantment with a decline of the religious factor's role and plausibility; within a wide range of social attitudes, religion seems destined to social irrelevance or to occupying a purely personal dimension. The second trend of thought sees a recovery and renewal of the role of religion in contemporary society, after a period of neglect, with particular reference to ancient religions.

The concept and problem of implicit religion is situated within a different perspective. Beyond the oppositions that locate the religious factor amongst those "religious" institutions balanced between death and resurrection, this concept initiates the observation that there is a widespread separation between believing and belonging, and in particular between

the numerous paths of existentialism within a culture and the dimensions of daily life with specific intentionality and therefore specific dimensions of ultimate meaning.

The concept of implicit religion is recent, and arose as a result of semantic difficulties related to reflection on the meaning and value of religiousness itself. Dietrich Bonhoeffer, during his imprisonment, proposed that a supernatural deviation of the spiritualistic tendencies of Catholicism and Protestantism usually results in a tendency to make sacred the world. Both Catholicism and Protestantism achieve the same result, that is, conceiving Christian life as based on the idea of a separation from the world. Bonhoeffer's proposal becomes dramatic when he reaches the conviction that there exists an insurmountable incompatibility between faith and religion.

The evocation of implicit religion is therefore not merely an academic expedient or a pleonastic concept. It is rather an analytical occasion, an instrument of the less visible and differentiated layers of the radical demand for meaning that exists in human life. Nor can it be interpreted as an indirect proof within the line of the resurgence of the religious factor.

The term *implicit religion* is one among a number of terms that have become familiar in the literature of sociology of religion, including *invisible religion* (Luckmann, 1967) *common religion* (Towler, 1974, pp. 145–162), *surrogate religion* (Robertson, 1970), *quasi-religion*, and *para-religion* (Greil, 1993). These terms have been introduced to help scholars deal with that which appears to be like religion, but is not actually religion, as well as that which does not appear to be religion, but actually is religion. Another such concept is *civil religion*, which refers primarily to a more integrated set of values and symbols that is, to some degree, actually held in common by a group of people (Bellah, 1970).

The concept of implicit religion, according to Edward Bailey, refers to people's commitments, whether or not they take a religious form. The study of implicit religion began in earnest in 1968, in the context of debate about secularization, and concentrated upon the spirituality and ethos of secular expression. This focus was determined because religious studies already generally concentrated on organized forms of religious belief, ritual, and community. In his conclusion to three studies on implicit religion in contemporary society, Bailey wrote:

Implicit religion which largely includes the empirical Christianity as well as the secular face of contemporary society, unlike archaic religion, is neither ecstatic nor corporate; and unlike historical religion, it is neither segmented nor visionary. So for most men, religion in general, and implicit in particular, is, and is likely to remain, dimensional in character, with extensive influence, rather than relational, with specific power. Yet moderation, or even inertia, can be held to as doggedly as apocalyptic or eschatology is preached or conversions are pursued. Belief may be fanatical, although still implicit (Bailey, 1983, p. 81).

Through the discussion of these relationships a number of questions relating to the meaning and application of the term *implicit religion* are raised. Wilhelm Dupré discusses various areas in which the critical potential of implicit religion becomes obvious (Dupré, 1991). These areas appear in situations in which developments in implicit religion account for considerable modifications in both the explicit religion and the cultural environment, and they extend as far as the many instances in which the concept of implicit religion has a critical impact on the perception of reality. Through a consideration of the main criteria used to define such concepts, a systematic but tentative typology is suggested.

In attempting to locate implicit religion within this typology, it has been found that it might be equivalent to: (1) a nonreligious meaning system; or (2) Thomas Luckmann's invisible religion; or it may include (3) generically both a nonreligious meaning system and invisible religion; or (4) even more generically nonreligious meaning systems, invisible religion, para-religion, and quasi-religion. Some scholars have appealed for a more appropriate conceptual tool kit and terminology to deal with this range of phenomena (Hamilton, 2001, pp. 5–13). To this end, the 1980s saw the appearance of sociologist Arnaldo Nesti's *Il religioso implicito* (1985) and the first issue of the journal *Religioni e Società*, both focusing on issues of implicit religion in society.

Although the notion of implicit religion is recent, one can find traces of it within the traditional social sciences. Even though the term itself and its exact references are not used in the socioreligious sphere, the problem and the dynamics from which its meaning and form derive are perceivable (Weber, 1920–1921; Schutz, 1932).

Max Weber's contributions, particularly regarding the polytheism of values, include the topic of intentionality in Edmund Husserl, the social character of *Lebenswelt* in Alfred Schutz (1932), and lessons connected to the dark side of personality in C. G. Jung. As an example, it is advisable to remember that the "polytheism of values" implies that the antagonism between different divinities has become "an everyday reality," depriving itself from any residual fascination coming from the myth. "To know how to face such an everyday life" is the difficult duty of modern humans, in opposition between the ethics of conviction and the ethics of responsibility. For Weber, the meaning of the polytheistic experience marks the descending course of Jewish-Christian monotheism and implies a viewpoint including the subject's act, whose meaning cannot be traced back to an exclusive theodicy (Weber, 1920–1921, pp. 264–265).

According to Nesti, implicit religion is a phenomenon, an analytical cipher of the difficulties of existential independence and of the symbolic-prescriptive transignification in progress in contemporary society, particularly in Western Christianity. The extent of such religiousness involves three factors. The first factor is connected to symbols and beliefs and rules and practices characteristic of the explicit "religious factor." Between the explicit morphology and the meaning

dimension correlated to it, a level that is in itself ambivalent is wedged in: consider silence and voice phenomenology, as well as the symbolicity of ritual dynamics.

The second factor must be traced among the "topoi" critical to the Christian "religious system" as a source of plausibility. Thus, an implicit religiousness can be traced in: (1) Christianity without faith; (2) Christianity without church; and (3) Christianity from an esoteric approach. A third factor must be reconstructed outside and in contrast to the "religious system" itself. There is, thus, an implicit hidden religiousness outside the "sacred fence." In particular, such an implicitness is acquired in: (1) agnosticism; (2) skepticism characterized by the art of living in the uncertainty of the present; and (3) atheism as metaphor provided with a radical meaning.

The specific nature of implicit religion lies in the attempt to override prejudices and stereotypes with the mechanism of forced repetition, so as to understand life and the world as experienced by people in the process of living. It is necessary to go beyond such common schemes as the identification of the religious with churches, sects, and institutions, or the dichotomy of secular and sacred, as well the antonyms visible and invisible, sacred and profane.

The outlined survey, in all its diversity, refers to a presence, to a unifying principle. Even if the word and the exact reference is missing within the socioreligious tradition, the perception of its issues and of the dynamic from which its meaning derives, is not absent. By applying the concept of implicit religion, we are induced to pass beyond conventional representations of religion to a concept of religion that begins with the experience of the subject, and thus to a new reading of the religious within the objective religious pluriverse.

ARNALDO NESTI (2005)

IMPURITY SEE PURIFICATION

INANNA. Inanna, the Sumerian astral deity representing the planet Venus, was known throughout the Mesopotamian world. The Akkadians (and later the Assyro-Babylonians) called her Ishtar. For both the Sumerians and the Akkadians she was the principal goddess in their respective pantheons. Inanna-Ishtar's closest counterparts to the west are the Canaanite Astarte and the later goddesses of Greece and Rome, Aphrodite and Venus.

When the Semitic Akkadians settled in the lower Tigris-Euphrates Basin, they assimilated the preexisting, predominantly Sumerian culture. Comparative Semitic evidence suggests that the Akkadian Venus deity was originally masculine but became completely feminized when identified with the female Sumerian deity Inanna. Because of the eventual syncretism of the Sumerian and Akkadian pantheons, the traditions concerning Inanna-Ishtar are extremely complicated. By one such tradition she is the daughter of the sky god An, by another the daughter of the moon god Nanna-Sin (and thereby the sister of the sun god Utu-Shamash), and by still another the daughter of Enlil or Ashur. Similarly, Inanna-Ishtar was associated with more than one consort, alternately Zababa of Kish, Ashur, An, and Dumuzi (called Tammuz by the Akkadians). Although her main cult center was Uruk, she was worshiped in many other localities, each of which gave her rather diverse epithets and characteristics.

INANNA IN SUMERIAN AND AKKADIAN MYTHOLOGY. The myth entitled "Inanna Takes Command of Heaven" tells the

story of how Inanna managed to bring down the Eanna, “the house of An,” from heaven and thus become “mistress of heaven.” Unfortunately the text has many lacunae, missing many passages of this remarkable adventure. The narrative begins with the decision of Inanna to take control of the Eanna and her appeal to her brother Utu for help in this task. The inner motives of the goddess, if her words are accurate, are the result of her wounded pride at being raped and a vague promise by An. However, no one knows where on earth the house of An is. Consequently, Inanna asks the assistance of a fisherman who has experience in sailing in the marsh. He willingly agrees, and after repeated attempts Inanna finally finds the Eanna in the marsh. It is impossible to know what defenses An had set up so the house would not be robbed, but certainly the scorpion with which Inanna fights must have been one. The text resumes with An’s hurt and regret for the theft that has occurred, but at the same time he makes the prudent decision to leave things as they are. The Eanna will from now on be the “most splendid temple in Sumeria.” A summary of the myth is given in lines 159–163, where the theft that has taken place and the new reality are once more emphasized. The Eanna will be the abode of the rule of Inanna, who is praised as “the greatest of all the heavenly gods.”

Completely different in tone is the narrative better known as the “The Descent of Inanna to the Underworld.” It could be renamed “The Ascent of Inanna to the Land of No Return” because, on the basis of continuing scholarship and the recovery of less ambiguous epigraphic evidence, the country to which the goddess goes is once again the Kur, “the mythical mountain” located east of Sumer, in modern Iran. As Silvia Chiodi (1994) has shown, there is no mention in the Sumerian texts that the mythical Kur—from which life arose, including the gods and plants, and to which the spirits of the dead return, as it were to return to the life-giving element from which they originated—is located beneath the earth. Besides, the ambiguous verb *e//* (to go up and to go down) used in this myth has been greatly clarified in the myth of Inanna and Shukalletuda by the variant verb *ila*, which can mean nothing except “to go up.” The myth, which is written in an expansive, grandiose style and in highly poetic language, describes the attempt, on this occasion unsuccessful, made by Inanna to expand her sphere of influence by taking control of the Kur, the undisputed realm of Queen Ereshkigal.

After Inanna has decided upon this action, she leaves earth and the sanctuaries dedicated to her, dresses in an appropriate fashion with clothes and jewels that symbolize her divine power, and sets off on her journey. Before she leaves she tells her faithful ambassador Ninshubur that if things go wrong she must go to Nippur, Ur, and Eridu to plead for the assistance of the gods on her behalf. Inanna presents herself at the gates of the great palace, which is defended by seven walls, and asks Neti to allow her to come in. Neti asks her to wait so he can obtain permission from the queen.

Ereshkigal apparently agrees but orders that Inanna should observe all the rituals customary in the Kur. No one may enter her realm dressed in finery, as the mistress of heaven had intended to do. So Inanna is allowed to enter, but at every gate she has to take off part of her clothing. When she comes before Ereshkigal, she is completely naked. Ereshkigal has a fit of uncontrolled rage when she sees her sister and turns her into a “corpse.”

“Three days and three nights have passed,” and Ninshubur carries out the orders Inanna gave her. Ninshubur goes to Nippur first and then to Ur, where she begs the gods of the two towns to save Inanna, who is being held in the Kur. But the two gods are unyielding. Ninshubur must go to Eridu. There the god Enki feels sorry for Inanna, although he criticizes the way she has behaved. Enki creates two sprites and gives them the job of saving Inanna by bringing her “the food of life and the water of life.” Galatur and Kurgarra, the two sprites, go down to the underworld, and after a detailed discussion with Ereshkigal, they are allowed to take away the corpse of Inanna, which they bring back to life. But no one may break the unbending rules of the underworld, so Inanna must provide a substitute in her place. When she leaves the Kur, she is accompanied by demons ready to seize and take back the one who is to replace her. On her return Inanna meets Ninshubur first, then Shara her son, then Lulal, but she refuses to allow the demons to take any of them because they had mourned the disappearance of the goddess. Continuing the journey, the group arrives in Uruk, where Inanna’s husband Dumuzi, instead of weeping, is amusing himself. The goddess becomes angry and lets the demons take Dumuzi. However, Dumuzi asks the god Utu to transform him into a serpent to escape from the demons trying to capture him.

In the variant from Ur, the demons are tired of the goddess’s outbursts and ask her to return to the Kur, so Inanna hurries to have her husband seized. At this point the appeal to Utu and the request to be transformed into a serpent are repeated, and Dumuzi takes refuge in the house of his sister Geshtinanna. The demons arrive at Geshtinanna’s house and ask for her brother, but she does not reveal that he has taken refuge with her. The demons nevertheless find Dumuzi in the sheepfold, where they capture him. When the main text resumes, the fate of the fly is decided, for reasons that elude the reader, and Inanna decides that Dumuzi’s sister should share his fate: “six months for him, six months for her.” The concluding doxology sweetly praises the queen of the underworld. Similar descriptions of the land of the dead are in the myth of Nergal and Ereshkigal and the classic *Epic of Gilgamesh*.

Of the two Akkadian recensions of the myth, the Middle Assyrian version, because of its shortness (a mere eleven lines), does not provide new information of any importance. The New Assyrian recension is 138 lines long and is complete, but a comparison with the Sumerian version of the so-called “descent” of Inanna to the underworld, over 400 lines

long, is required despite their clearly different cultural milieus. The main events and divine characters are certainly similar if not identical. The queen of the underworld in both myths is the same, Ereshkigal, the Sumerian goddess who rules the realm of the dead. The heavenly goddess who goes to the other world is Inanna in the Sumerian myth, whereas in the New Assyrian myth it is Ishtar. The two goddesses had been amalgamated by Mesopotamian religious tradition. The other gods who become involved are mostly the same, starting with Dumuzi and ending with Sin and Ea (Nanna and Enki, respectively). The herald is different, Ninshubur in the Sumerian recension, Papsukkal in the New Assyrian version.

The New Assyrian account, though more condensed and concise than the Sumerian version, still provides substantial new elements. For example, the scribe stresses the disastrous consequences for humanity and livestock caused by Ishtar's departure from the earth, described by Papsukkal when he tries to get first Sin and then Ea to secure the release of the goddess from the underworld. He also describes the far from pleasant nature of life in the underworld, not only for the dead but also for the queen of the underworld. In place of the two sprites, Galatur and Kurgarra, created by Enki to save Inanna, here Ea creates "Asushunammir, the court jester," who is assigned the task of moving Ereshkigal. The ending of the story is also different. In the New Assyrian version the return of Dumuzi from the underworld altogether with the dead is mentioned, albeit optatively, something which is quite incomprehensible, as Wolfram von Soden (1967) points out in his commentary on the passage.

Once again the Kur is the main focus of Inanna's attention in the following myth, which illustrates the fundamental point that the Sumerians considered the "mythical mountain" the source of life and all good things. Inanna turns to her brother Utu, the sun god, and asks if she can sail with him in his daily journey across the vault of heaven toward the Kur to enjoy the wonderful plants there. She is particularly interested in discovering the secret of female charms and the techniques of love with man. Only after she has experienced what love may mean is she prepared to go back to the city of her birth and resume her family role as mother, mother-in-law, and sister-in-law. The text concludes with a new hymn to the sun god that emphasizes his assistance to all those in trouble, from travelers to widows and orphans. The final sentence expresses the joy and relief of all those who can travel in his light.

Another interesting Sumerian text begins with a description and a hymn to the goddess with clear warlike qualities. An auto-eulogy describes the activities of Inanna and observes that only the Kur has refused to submit. The goddess dresses suitably and appears before her father An, seeking justice. She virtually asks him to agree to her interfering in the Kur, but An strongly advises his daughter against such action because he is convinced that this is another of Inanna's tantrums. Inanna remains implacable and engages in deadly

combat with the Kur. She sends a torrent of water and a burning fire to subdue the lively spirits of the Kur, and she reduces the mountain, previously an earthly paradise, to a silent desert. At this point the goddess describes the outcome of the war and sets out the fate of the vanquished. She follows with a new, haughty auto-eulogy, in which she praises her memorable victory over the Kur. The concluding doxology is addressed to Nisaba, the goddess of academia, from where this text definitely originated.

In Sumerian literature the following myth is often called "Theft of the Divine Powers by Inanna from Enki." In fact, nothing could be more inaccurate and inconsistent. On this occasion Inanna has done nothing wrong to anyone, and what has been considered "theft" is in fact a completely voluntary gift from the god of wisdom. As the myth begins the goddess of Uruk is standing in front of a mirror admiring her beauty, including her private parts. Inanna is not content, however; she needs something further to complete her portrait. So she decides to go to Enki and ask him for something related to sex. The god of wisdom foresees her visit and gives orders for Inanna to be received with full honors. When Inanna arrives, Enki's herald Isimud extends full hospitality and lays on a banquet for the guest, which Enki attends. But Enki drinks too much and becomes drunk. At this point Enki volunteers to give Inanna divine powers or the essence of all things, and she accepts them happily. She makes a list of all the good things she has received, loads the gifts on her ship and sets off back to Uruk.

When Inanna has left port, Enki becomes himself again and, aware that he has been thoughtless, wants to recover the divine powers now heading to Uruk. After an interlude about a frog, whose fate is determined by Enki, the god sends Isimud on a mission to ask Inanna to return the gifts she has been given. Six times Inanna, with the aid of Ninshubur's magic, manages to prevent the monsters sent by Enki from taking control of her ship, which is sailing the arc of heaven. The ship finally reaches Uruk, where it is welcomed joyfully. Enki still cannot take in what has happened and sends his herald to Uruk with a list of the goods taken by Inanna. Meanwhile, the joyous atmosphere at Uruk affects everyone. Inanna renames all the city districts and assures her people of all the benefits that will result from the arrival of the divine powers. At this point Enki has no choice but to accept the loss and forecast the undoubted future greatness of Uruk.

LOVE STORIES. Among the accounts of the lovers and love stories of the goddess is the myth of "Inanna and Shukalletuda." The main theme is the misfortune of Inanna when she is raped by a mortal man, who must be punished with death. The story begins with a description of the goddess Inanna and her journey to the Kur, where she aims to enhance her divine powers. After the first break comes the story of the creation of the palm tree by Enki and the raven. Now the second main character Shukalletuda is introduced, seen trying desperately to water a flowerbed. Then follows the key moment in the myth, the rape of the virgin Inanna while she

is resting under the shade of the only poplar in the garden. When Inanna realizes what has happened to her, she intends to punish the perpetrator. She sends plagues to the earth, first putting blood in the wells of the country, then she sends a hurricane and a sandstorm, in the end completely sealing off every road in the land.

Shukalletuda has been able to escape the anger of the goddess by hiding among his own people, so the goddess turns to Enki for help. Enki allows her to find Shukalletuda, who is condemned to death. The wrongdoer tries to excuse himself, explaining to the goddess that he was not really to blame, but this only angers her even more. Her only promise is that the name of Shukalletuda will be remembered in song after his death. After Shukalletuda's fate has been settled there is a hymn of praise for the holy Inanna.

The myth concerning the death of Dumuzi, the beloved husband of Inanna, on the other hand, is part of a series of stories about the strained relationship between Inanna, the mistress of heaven and of Uruk, and Dumuzi, the shepherd whom she loves, at least according to the love poems that have survived. A completely negative view of the lovers of Inanna is presented in the three redactions of the *Epic of Gilgamesh* that recount the episode when Ishtar falls in love with the hero. The passage in which Gilgamesh rejects Ishtar's offer that he become her husband, completely enraging the goddess, who at once sets about punishing him for this insult by sending down to earth the Bull of Heaven, has no equivalent in the Sumerian story of the same episode, where the reason for the quarrel seems to be political rather than emotional. To find anything like what is described here, it is necessary to resort to Sumerian literary texts on love concerning the goddess Inanna.

The detailed list of the jilted lovers of Ishtar spans the human and divine worlds and even includes the beasts of the earth, who have all received scant reward for their love of the goddess. Following is a list of the lovers and their rewards:

Dumuzi year after year of mourning
 the bird Alallu broken wings
 lion ditches dug
 horse bridle, whip, and reins
 shepherd changed into a wolf
 Ishullanu the gardener turned into a mole

It can be understood why Gilgamesh refuses her enticing offer, especially when it becomes clear that the goddess is offering the king of Uruk a kingdom in the underworld.

The myth of "Ishtar and Saltu" was intended to be sung and includes notes on how it should be sung, as well as evidence of a refrain. It is reasonable to conclude that it was divided into more than ten songs that tell of the occasion when the gods were forced to take strong measures to curb the high spirits of the goddess. Its composition can be dated with cer-

tainty to the Old Babylonian period, more accurately during the reign of Hammurabi, who is mentioned by name. At the beginning the goddess and all her qualities are described, especially the strength that makes her so cut out for war. But the goddess certainly overdoes matters, because all the gods, particularly the god of wisdom Ea, find her behavior completely unacceptable. Ea decides to check the goddess's reckless behavior by creating a match for her. The new creature is formed from the dirt underneath the nails of the god of wisdom, and she is aggressive as well as beautiful. The god Ea gives her the task of defeating Ishtar, along with useful advice. Ishtar has learned of the changed situation, however, and sends her herald Ninshubur to find out what Saltu (meaning "strife") is like and how powerful she is. The contest between the two goddesses is fierce, but because they are evenly matched, neither wins or loses. Ishtar, at this point in the story, has a new name, Agushaya. She is unable to bear the shame of defeat, so she turns to Ea, asking him for an explanation of the changed situation and to eliminate her opponent. Ea willingly agrees to what Ishtar asks, reconfirming the function of the goddess on earth and inviting humanity to celebrate a feast to mark the creation of Saltu and the ultimate victory of Ishtar. In the doxology Ishtar and her patron Ea are praised for the defeat of Saltu.

GIOVANNI PETTINATO (2005)
Translated from Italian by Paul Ellis

INCANTATION. The practice of incantation (Lat., *incantatio*, from *incantare*, "to chant a religious formula") differs considerably from culture to culture. For the purposes of this cross-cultural overview, however, incantation can be understood as the authorized use of rhythmically organized words of power that are chanted, spoken, or written to accomplish a desired goal by binding spiritual powers to act in a favorable way.

Since incantation uses words to move spiritual powers and accomplish a desired result, this practice is related to other uses of sacred language such as prayer, invocation, blessing, and cursing. Verbal formulas associated with prayer beseech the spiritual powers for certain actions or maintain communication by praise and submission. However, verbal formulas associated with incantation are designed to perform the desired result by "obliging" (Lat., *obligare*, "to bind") spiritual powers. Invocation, blessing, and cursing are used with both prayer and incantation.

THE POWER OF INCANTATION. Even though practices of incantation differ widely from culture to culture, its validity or efficacy appears to depend on cultural consensus about a number of primary factors, namely, the power of the chanted verbal formula, the authority of the incantor, the receptivity of spiritual forces both good and evil, the connection with the religious or mythological tradition, and the power of the accompanying ritual.

The power of the formula. Societies that use incantations understand them to be performative, that is, they accomplish what they say. The act of chanting the verbal formula itself has power. Scholars have put forth a variety of explanations concerning the effect incantations have for people. Older theories considered incantation to be a form of magic, an attempt to control and manipulate the forces of nature. More recent theories have suggested that incantations are expressive of needs and wishes or symbolize a desired result, or that they have the psychological effect of restructuring reality in the minds of people. Although these explanations may provide certain insights into the meaning

of incantation, it must be remembered that, to the people involved, the proper chanting of the formula itself has performative power. To them it does not express or symbolize some other action—it *does* it. When, for example, the incantation experts of the Trobriand Islanders chant over the newly planted yam vines, "Raise thy stalk, O taytu. Make it flare up, make it lie across!" (Malinowski, 1935, vol. 1, p. 146), the people know that the "hearing" of these commands by the tubers is what makes them sprout and grow.

It is not, however, just any words that have such power. Incantations are special verbal formulas that in a variety of ways, depending upon the particular cultural tradition, tap into sacred power. They may, for example, contain powerful scriptural expressions, mantras, or sacred names. They are usually rhythmically organized and chanted repeatedly. They may use special devices such as foreign or unintelligible words, "abracadabra" nonsense phrases. The Anglo-Saxon medical-incantation treatise *Lacnunga* provides an example, using powerful names and impressive nonsense words:

Sing this prayer over the black blains nine times: first, Paternoster. "Tigath tigath tigath calicet aclu cluel sedes adcloles acre earcre arnem nonabiuth aer aernem nidren arcum cunath arcum arctua fligara uflen binchi cutern nicuparam raf afth egal uflen arta arta trauncula trauncula. [In Latin:] Seek and you shall find. I adjure you by the Father, Son, and Holy Spirit that you grow no larger but that you dry up. . . . Cross Matthew, cross Mark, cross Luke, cross John." (Grattan and Singer, 1952, p. 107; my trans.)

It should be noted that, although the primary power of an incantation resides in its oral presentation, once these formulas could be written down, the chirographic (handwritten) text itself contributed to the potency of the incantation. From before 600 CE come Jewish-related Aramaic incantation texts written by experts on bowls and designed to ward off various sorts of evil. Such power could now be extended even into the realm of the dead, as in the case of Middle Kingdom Egyptian incantations inscribed on the inside wall of coffins, by which the various gods and demons encountered by the soul would be bound to act beneficially.

The chanter's authority. Closely connected to the power of the verbal formula is the authority of the incantors. These may be experts in terms of learning or ecclesiastical authority, like Daoist priests or Christian monks; they may be people who have been specially initiated into the use of such power, like various kinds of shamans; they may be charismatic holy ones who keep certain special observances or practices that sanction their authority. In the incantation itself, the chanter often clothes himself in the aura of divine authority and power. A Malay shaman, drawing authority from both Hinduism and Islam, outroars a thunderstorm:

Om! Virgin goddess, Mahadewi! Om!
Cub am I of mighty tiger!
'Ali's line through me descends!
My voice is the rumble of thunder, . . .
By virtue of my charm got from 'Ali

And of Islam's confession of faith. (Winstedt, 1925, p. 59)

Receptivity of the spiritual forces. The power of the incantation further derives from the people's shared understanding of the nature and receptivity of the spiritual powers to be moved and bound by the powerful words. That spiritual entity may be simply an object or person that is to perform in a certain way. At other times, the incantation invokes, with careful mention of names, spirits, or gods who control aspects of nature and life, empowering or binding them to act beneficially. Ritual specialists of Java, when burying the umbilical cord of a newborn baby, intone the following words: "In the name of God, the Merciful, the Compassionate! Father Earth, Mother Earth, I am about to leave in your care the birthcord of the baby. . . . Don't bother the baby. This is necessary because of Allah. If you do bother him, you will be punished by God" (Geertz, 1960, p. 46).

A great many incantations are addressed to evil spirits or demons, conjuring them to leave or stay away. It is extremely important that the incantor name and identify the origin and characteristics of the evil power in order to bind it. Pre-Spanish Maya incantations, for example, list detailed knowledge about the evil spirit of the disease, recounting its parentage, its lustful impulses that inspired its shameful birth, and all its characteristics; they then proceed to consign the spirit to the foul-smelling underworld or to cast it into the wind to fall behind the sky. An Aramaic incantation becomes very specific in naming one of the many demons: "I adjure you, Lilith Ḥablas, granddaughter of Lilith Zarnai, . . . the one who fills deep places, strikes, smites, casts down, strangles, kills, and casts down boys and girls, male and female foetuses," while another text conjures by name nearly eighty demons and spirits of evils or sicknesses (Isbell, 1975, pp. 61, 121–122), showing that, occasionally, an incantation will name a whole series of evil spirits and demons—just to be sure that the right one is included.

Connection of the chant with tradition. The successful operation of the incantation depends on its connection with the religious or mythological tradition of the people. In one way or another, the incantation fits the specific human circumstance into the larger pattern of sacred existence and power as known in the religion of the people. Incantations in which such patterns are made explicit can be called narrative incantations. For example, Scottish incantations are regularly grounded in stories or legends about Christ and his disciples, as in this example: "Christ went on an ass, / She sprained her foot, / He came down / And healed her foot; / As He healed that / May He heal this, / And greater than this, / If it be His will to do" (Carmichael, 1928, vol. 2, p. 17). An ancient Egyptian narrative incantation, relating at great length how Isis rescued her son Horus from a scorpion's bite, concludes with the main point: "It means that Horus lives for his mother—and that the sufferer lives for his mother likewise; the poison is powerless!" (Borghouts, 1978, pp. 62–69).

The accompanying ritual actions. While incantations can be used alone without any accompanying actions, in most cultures the chanting of incantations is usually associated with the power of other ritual actions. The incantation may be related to a ritual object that it empowers with sacred force. For treating a child with worms, the Javanese doctor chants over a special herb: "In the name of God, the Merciful, the Compassionate! Grandmother spirit, Grandfather spirit. . . . The harmful worms—may they all die. The good worms—may they stay for the whole length of the child's life" (Geertz, 1960, p. 93). Cherokee specialists almost always chant their incantations over tobacco, "remaking" or empowering the tobacco to perform the desired benefit. A Daoist priest chants this incantation over a small puppet as he rubs it over a patient: "Substitute, be thou in place of the fore part of the body, . . . be thou in place of the back parts, . . . be thou in place of the left side, that health may be ensured to him for year upon year" (de Groot, 1967, vol. 6, p. 1260). Incantation texts are often accompanied by directions for ritual actions. For example, an ancient Mesopotamian incantation for potency commands: "Let the ass swell up! Let him mount the jenny! Let the buck get an erection! Let him again and again mount the young she-goat!"; then the ritual directions follow: "Pulverized magnetic iron ore you put [into] puru oil; you recite the incantation over it seven times; the man rubs his penis, the woman her vagina with the oil, then he can have intercourse" (Biggs, 1967, p. 33). Incantation and ritual together accomplish the desired result.

FORMS OF ADDRESS. Within the great diversity of forms taken by the incantation formulas in different cultures and even within the same culture, a number of standard types can be discerned in the way spiritual powers are addressed. Many operate with the command form, using imperatives or statements of obligation to bind the spiritual powers to the desired action. Other incantations use the declaratory mode to establish the hoped-for result. And there are other incantations that approach the prayer mode, beseeching or charming the spiritual powers to take the beneficial action. Many times, of course, incantations use a combination of these three forms.

The command form, at its simplest, consists in naming the spiritual power and binding it to the desired action with an imperative. The High German "Pro Nessia" incantation from the ninth century CE, driving out the worm spirit that causes disease, is pure command:

Go out, nesso,
with the nine little ones,
out from the marrow into the veins,
from the veins into the flesh,
from the flesh into the hide,
from the hide into this arrow.
Three paternosters. (Hampp, 1961, p. 118; my trans.)

In Burma, an exorcist addresses many powers of the supernatural world in a general incantation in order to focus his

powerful command on the *ouktazaun* (minor spirit) that is possessing his client: “To all the *samma* and *brahma devas* of the sky heavens; to all the ghosts, monsters, and other evil creatures; to the ogres of the earth; to the master witches and the wizards; to the evil nats and the *ouktazauns*: I command you to leave. I command you by the glory of the Triple Gems [Buddha, Dhamma, and Sangha]” (Spiro, 1967, p. 177).

Very often incantations use a declaratory mode to perform the intended result of binding evil forces or compelling the good, declaring the desired state to be a reality in the present or the future. A Cherokee incantation designed to break up a happily married couple, for the benefit of a forgotten lover, simply declares the result to be so:

Now! Very quickly pillow your head upon the Soul of the Dog, outside, where there is loneliness!

Your name is _____.

In the very middle of your two bodies loneliness has just come to think.

You are to be broken in the Pathway.

Now! Where the joining is has just come to be divided.

Your two souls have just come to be divided somewhere in the Valley.

Without breaking your soul, I have just come to stupefy you with the Smoke of the Blue Tobacco. (Kilpatrick and Kilpatrick, 1965, pp. 139–140)

When the Trobriand sorcerer tours the gardens with their budding leaves, he intones, “The yam rises and swells like a bush-hen’s nest. The yam rises and swells like a baking-mound. . . . For these are my yams, and my kinsmen will eat them up. My mother will die of surfeit, I myself will die of repletion” (Malinowski, 1935, vol. 1, p. 146). It is in this declaratory mode that blessings and curses are often formulated, focusing on the person or thing to be involved and declaring the favorable or unfavorable state to be a reality.

A third mode of expression in many incantations is that of beseeching or charming the sacred powers to act benevolently. This form approaches that of prayer and, at times, is indistinguishable from it. Yet the typical expressions, “May you,” “Let God,” “I ask you,” and the like, can also be understood as compelling or binding the spiritual powers, not just beseeching them. A Burmese doctor chants a prayer-spell over a sick girl, repeating it three times as he empowers many spiritual beings for action: “May the five Buddhas, the nats, and the Brahmas rest on the forehead [of the patient]; may Sakka rest on the eyes and ears, Thurasandi Devi on the mouth, and Matali on the hands, feet, and body, . . . and may they guard and protect me” (Spiro, 1967, p. 152). And the Malay incantor turns even to Iblis (Satan) and the other spirits and devils and firmly requests direct action on behalf of his lovesick client:

In the name of God, the Merciful, the Compassionate!
Friend of mine, Iblis!
And all ye spirits and devils that love to trouble man!

I ask you to go and enter the body of this girl,
Burning her heart as this sand burns,
Fired with love for me. (Winstedt, 1925, p. 165)

PURPOSES OF INCANTATION. Purposes for the use of incantation differ widely and cover the whole gamut of life needs of individuals and societies. It is possible, however, to classify incantations, according to their purpose, into three broad categories: defensive, productive, and malevolent.

Defensive incantations. Among defensive incantations, a major purpose is prophylactic or apotropaic, that is, warding off evil spirits and their troubles, especially in the critical passages of life. Classic among apotropaic incantations are those widespread in the ancient Near East, directed against demonic powers called lilithe—ghostly paramours of men, who attack women during their periods and at childbirth and who devour children. An incantation bowl binds these demons:

I adjure you, every species of lilithe, in the name of your offspring which demons and lilithe bore. . . . Woe, trampers, scourgers, mutilators, breakers, disturbers, squeezers, muzzlers, and dissolvers like water. . . . You are fearful, terrified, and bound to my exorcism, you who appear to the sons of men—to men in the likeness of women and to women in the likeness of men—you who lie with people during the night and during the day. (Isbell, 1975, pp. 17–18)

Vedic incantation from ancient India is directed against the fiends who cause pregnant women to abort: “The blood-sucking demon, and him that tries to rob health, Kanva, the devourer of our offspring, destroy, O Prisiniparni [medicinal plant], and overcome!” (*Atharvaveda* 2.25.4, as cited in Bloomfield, 1964, p. 22). The Egyptian Coffin Texts testify to the need for incantations to ward off the evil powers who feast on the soul in the passage of death.

The other major use of defensive incantations is for the expulsion of evil powers that have taken up abode. A Malay Muslim shaman exorcises the demon of disease, reciting first the creation story and then chanting,

Where is this genie lodging and taking shelter?. . .
Genie! if thou art in the feet of this patient,
Know that these feet are moved by Allah and His prophet;
If thou are in the belly of this patient,
His belly is God’s sea, the sea, too, of Muhammad. . . .
(Winstedt, 1925, pp. 62–63)

Sickness can also be seen as the result of attack by rival humans, and then the appropriate measure is a counterincantation. The Atharva priest of ancient India chants over a special ritual plant: “The spell which they skillfully prepare . . . we drive it away! . . . With this herb have I destroyed all spells. . . . Evil be to him that prepares evil, the curse shall recoil upon him that utters curses: back do we hurl it against him, that it may slay him that fashions the spell” (*Atharvaveda* 10.1.1, 4–5, as cited in Bloomfield, 1964, p. 72).

Productive incantations. A second purpose of incantation is beneficial, that is, it promotes growth, health, and

happiness either by urging on the responsible inherent powers or by causing beneficial interference by divine powers. A curer in Java uses a massage and a spitting ritual with this incantation:

In the name of God, the Merciful, the Compassionate!
 May the Prophet Adam repair [the person],
 May Eve order [the person].
 Untangle the tangled veins,
 Right the dislocated bones,
 Make the fluids of the body feel pleasant, . . .
 Health falls with my white spittle,
 Well, well, well, by the will of God. (Geertz, 1960, p. 94)

A great many incantations of the productive type have to do with love and sexual attraction, marriage, home and family, potency, successful birth, and the like. The Cherokee, for example, have a large variety of love incantations, for creating loneliness in the desired person, for retaining affection of a wandering mate, for acclimatizing a newlywed wife, or compelling a runaway spouse to return. Cherokee men and women can use incantations to “rebeautify” themselves and thus become attractive to a potential mate:

Now! I am as beautiful as the very blossoms themselves!
 I am a man, you lovely ones, you women of the Seven
 Clans! . . .
 All of you have just come to gaze upon me alone, the
 most beautiful.
 Now! You lovely women, already I just took your souls! I
 am a man!
 You women will live in the very middle of my soul.
 Forever I will be as beautiful as the bright red blossoms!
 (Kilpatrick and Kilpatrick, 1965, pp. 86–87)

At times, productive incantations are needed to bring about pregnancy, as this one from ancient India: “Into thy womb shall enter a male germ, as an arrow into a quiver! May a man be born there, a son ten months old!” (*Atharvaveda* 3.23.2, as cited in Bloomfield, 1964, p. 97).

Malevolent incantations. A third purpose of incantation is related to the need to harm, punish, or take revenge on enemies or rivals. A jilted woman can target her erstwhile lover with this fierce imprecation:

As the best of the plants thou art reputed, O herb; turn
 this man for me today into a eunuch that wears his hair
 dressed! . . . Then Indra with a pair of stones shall
 break his testicles both! O eunuch, into a eunuch thee
 I have turned; O castrate, into a castrate thee I have
 turned! (*Atharvaveda* 6.138.1–3, as cited in Bloomfield,
 1964, p. 108)

The Cherokee bent on revenge learns from the shaman to recite the name of his adversary, repeating the following incantation four times and blowing his breath toward him after each rendition: “Your Pathways are Black: it was wood, not a human being! Dog excrement will cling nastily to you. You will be living intermittently. . . . Your Black Viscera will be lying all about. . . . Your Pathway lies toward the Nightland!” (Kilpatrick and Kilpatrick, 1967, p. 127).

CONCLUSION. Incantations, as rhythmic or formulaic words of power used to accomplish a desired goal by binding spiritual powers, have sometimes been considered as magic rather than religion, or as a form of religious practice lower than prayer. It is true that incantations oblige the powers to perform the action rather than prayerfully request them for it. And it is also true that incantations have to do with self-interest, sometimes at the expense of others. Yet they do represent a religious mode of being in the world, albeit a mode of aggression rather than simple submission to spiritual powers. The power of chanted words fits the events of human life into the pattern of the sacred realities that underlie and support human existence. Far from being trivial, incantations provide help for whatever deeply troubles or concerns humans: health, birth, love, marriage, family, prosperity, death. Human existence is understood as a drama involving the interaction of many spiritual powers, and, through the power of the chanted formula, a restructuring of these powers is performed so that life can become more healthy, secure, prosperous, and happy.

- Winstedt, R. O. *Shaman, Saiva and Sufi: A Study of the Evolution of Malay Magic*. London, 1925. Includes translations of many incantations in a study of religious practices in Malay culture, which mixes Islamic, Hindu, and indigenous religious influences.

THEODORE M. LUDWIG (1987)

INCA RELIGION. The pre-Columbian Andean cultures, of which the Inca empire was the final heir, extended over a geographical area that the Inca believed corresponded to the four quarters (*tabuaintinsuyu*) of the world. At the time of the Inca empire's fall to Spanish forces under Francisco Pizarro in 1532, the Inca occupied large portions of present-day Ecuador, Peru, Bolivia, and Chile. The great Andean civilizations flourished in this setting of contrasting ecosystems (coastal desert ribbed with fertile valleys, arable highlands at altitudes of more than four kilometers, Amazonian and montane rain forests) that offered resources for pursuing a variety of means of subsistence, including fishing, hunting and gathering, agriculture, and the herding of llamas, guanacos, and alpacas.

HISTORICAL BACKGROUND. The great pre-Inca civilizations that flourished in what is now Peru were the Chavín (after about 800 BCE), the Nazca and Moche (c. 100–800 CE), the Tiahuanaco (c. 200–1000), the Huari (c. 800–1200), and the Chimú (c. 1200–1400). None of these cultures, the Inca included, appears to have possessed a written language, though this function was filled, to some extent, by the use of *quipus*, or knotted strings. (The geometric plastic arts of

the ancient Andean peoples may one day be shown to comprise a system of ideograms.) Aside from scattered archaeological evidence—including figurative and abstract images on stone and wood, funerary pieces, and some fresco fragments—we possess documents (written in Spanish and, less frequently, in Quechua) that were composed during the years following the Conquest and that detail the religious practices of indigenous Andean peoples. (The Inca were reported to have painted mythological scenes on canvas and wood, but these are now lost.)

Despite their separation in time and the contrasts between their ecological milieus, the Andes high cultures and their religious systems manifested a common spirit. Religious practices permeated all aspects of public and private life. These religions for the most part included cults of the dead, of ancestors, of a founding culture hero, and of a divine king. Offerings and sacrifices (often human) were performed, and reflected beliefs in the needs of the “living corpse” and in the exigencies of the cosmic powers on which the cycles of nature depended. These deified powers were portrayed as monstrous beings that combined human, animal, and vegetable traits. The images of the principal deity throughout these cultures were basically variations on constant themes. This deity, which in images is variously characterized as an anthropomorphized feline (a puma or jaguar), a one- or two-headed serpent, a condor, or an ear of maize, is often portrayed brandishing weapons or other instruments.

The temples of the urban centers of these civilizations were built either in the form of truncated, stepped pyramids or as series of enclosures. Some possessed underground vaults, with or without labyrinths. In some locations, temple architecture is suggestive of the structure of the cosmos, comprising three vertical levels. Elsewhere, rows or circles of stones testify to astral observations and to cults connected to the organization of sacred time and space, in which the movements of the sun, moon, and stars, the alternations of day and night and dry and rainy seasons, the cycles of the earth and sea, and human, animal, and vegetable fecundity all seem to play a role. Calendars were based on the cycles—individually or in combinations—of the sun, the moon, the planet Venus, and the Pleiades. The Sun and Moon pair of deities and the pair composed of this couple's sons (often seen as enemy twins) were important pan-Andean deities. Among coastal groups, the Moon, represented in bird form and associated with the sea and the dead, was the preeminent deity. Divine symbols and religious rites were not, however, always directly related to the ecosystem within which the particular culture flourished, as is evident when one compares pre-Inca iconography with Inca mythology and with the myths of present-day Amazonian peoples.

INCA COSMOLOGY. The Inca religious system is usually attributed to either the Inca Tupac Yupanqui or his predecessor, the Inca Pachacuti, and dates to at most one hundred years before the European conquest. The expansion of Cuzco, the Inca capital, was carried out in the name of the superiority

of its gods over those of other peoples who, once they were assimilated into the empire, left their principal idol (or its replica) in the Inca capital. The colonization, or federation, was founded on a system of reciprocity overseen by Cuzco. Certain cults and temples were richly endowed by the Inca (the title given the head of the empire); others were suppressed. The great social and religious leaders of the empire went regularly to the capital city, and the Inca brought colonies of collaborators (*mitima*) to the temples of the empire and sometimes had himself named priest of honor. The sanctuaries of the provinces paid tribute in kind to Cuzco, contributing, for example, young children to be sacrificed during the Capacocha ceremony, which was held to ensure the Inca's health and prosperity. Rites of communion were held periodically to ensure the political and religious cohesion of the empire. Generally, these rites took place at the Temple of the Sun, in the center of the *tabuantinsuyu*, which center was located at the junction of the two rivers of Cuzco. Slow processions or rapid messengers departed from and returned to this center, traveling along the roads that divided the empire into four regions (*chinchaysuyu* to the northwest, *antisuyu* to the northeast, *contisuyu* to the southwest, and *collasuyu* to the southeast) or along the forty-one *ceque* (theoretical lines radiating from the center, on which 428 shrines were placed), and returned. Although the Inca authorized the conservation of certain regional religious structures in the cities of the empire, they also reproduced Cuzco's geometrical organization of sacred space and built replicas of the capital's principal temples in all the ceremonial centers. The bipartition of villages and adjacent territories—the distribution in halves—was common throughout the Andes. In Cuzco these halves were called *hanan* (which roughly means “high, superior, right, masculine”) and *hurin* (“low, inferior, left, feminine”). Other categories of opposition and complementarity could intersect or be superimposed over this base, determining various socioreligious complexes. Such halves (or moieties) were linked respectively with the cosmic powers of the lower and upper worlds, and with two cardinal points.

The inhabitants of the Andean region worshiped a great number of gods, idols, and spirits, which were designated by the generic name *huaca*, a term that was also applied to the shrines. The oral traditions frequently related the adventures of the great *huacas* (gods or parents of gods), their births and metamorphoses; the magical creation of wells, lakes, and irrigation canals; hunts, rivalries, wars, and conquests of lands, waters, and women who were captured by force or trickery; and the powers of the *huacas* over men and men's duties toward them. All this took place “in the time when the *huacas* were men . . . afterward they were turned into stone.” Each family—and, at the higher level, each village and province—claimed to descend from a given *huaca* (a particular man-god, conquering ancestor, founder, or civilizer), who represented a cosmic power and whom they venerated in the form of a mummy, a stone, an animal, or a constellation of stars. The codification of these beliefs was founded on the oppositions and complementarities of nature—binary or ternary

(e.g., man-woman, the head and the two arms), biological and parental, or cultural (conqueror-conquered, interior-exterior, etc.)—expressed in the representation of cosmic forces. Similarly, certain numbers, probably the results of astronomical calculations, gave order to the sacred.

INCA GODS. The kings of Cuzco, reputed to be sons of the Sun, formed a religious, cosmic, and territorial imperial structure in which the Sun reigned over the Andean highlands and the heavens and the god Pachacámac ruled over the lowlands and the underworld.

The Coricancha, the great Temple of the Sun in Cuzco, was flanked by two golden pumas and its walls were covered with gold and silver plaques. The halls contained statues and cosmic representations, and the mummies—or their replicas—of earlier kings and queens. There were three sculptural triads of the Sun; each included a father and two sons, each triad symbolizing, respectively, the heavenly body, its light, and its vital warmth. One of these statues, Punchao, depicts two pumas between whom is seated a man with serpents at his waist and rays emanating from his shoulders. It contained a reliquary filled with a powder made from the entrails of dead kings. The temple sheltered a large number of priests (the first priest was a close relative of the Inca) and the “virgins of the Sun” (*aclla*), who dedicated themselves to making cloth and corn beer for the cult of the Sun, and who also served as concubines to the Inca (who was himself the manifestation of the Sun) or to dignitaries.

From the dark bowels of the cosmos, Pachacámac caused earthquakes and sent pestilence. With his wife Pachamama (“mother of the earth”), he ruled the waters of the underworld, and, with his daughters, he controlled the depths of the sea. His temple was located at the seacoast. Although represented by a golden fox, he was also worshiped in the form of a wooden pillar, which was sculpted in a dark chamber atop a truncated adobe pyramid.

Illapa, who represented thunderbolts, lightning, rain, hail, snow, and frost, was venerated by a large cult in the highlands. He was conceived of as a triad (father, brother, and son). One of the three was represented by a man holding a club in one hand and a sling in the other. It was said that the *huacas*, sons of Illapa from whom various tribes were descended, had been thrown off a mountaintop and were raised by humans. They were identified with the mountain and became masters of its animals and plants. The mountains were personified and arranged hierarchically and were the object of a cult.

The serpent Amaru represented the striking thunderbolt and also the animal or monster who, according to the myths, rose from the lake and moved toward the upper world. With one head at each of his extremities, Amaru symbolized communication between the upper and lower parts of the cosmos.

Women were the principal participants in the cult of Quilla, the Moon, who was the sister and wife of the Sun.

The Coya (“queen”) was believed to be the daughter of the Moon, just as the Inca was believed to be the son of the Sun. The anthropomorphic statues of Quilla were silver, while those of the Sun were gold. A lunar calendar was used along with a solar calendar. Quilla was associated with the earth and the dead. Traditionally, she pursued dead thieves into the underworld at night. One month of the year was especially sacred to her. Men also worshiped her, in Cuzco and elsewhere, particularly in the temple of Nusta, which was located on an island in Lake Titicaca.

When they were not visible, the stars, like the sun and the moon, were believed to go under the earth. The Milky Way—thought of as two rivers—may have inspired the construction of the Coricancha at the junction of the two rivers of Cuzco. Among the constellations, that of the llama, visible during the dry season, was of special importance to cattle raisers. The Pleiades were associated with the rainy season. If they appeared clearly at the end of May, a good harvest was augured.

After death, one of the two souls that were attributed to a man returned to its place of origin, either before or after a journey strewn with obstacles, and dwelt in the land of the souls, which was not unlike the world of the living. The kind of afterlife enjoyed by this soul was conditional on the type of death, social rank, and virtues of the dead. The other soul remained in the body, which had to be preserved intact, and which had the same needs as the living person. The bodies of nobles, kings, and queens were mummified, kept by their families, and often moved about. The mummies of ancient kings—or their replicas—were set out hierarchically in parallel series (*hanan* and *hurin*) of four. At the head was the common founding ancestor, theoretically androgynous, of whom the first was Manco Capac. The ancestors, associated with the netherworld and germination, were considered oracles of the past, the future, and distant events, and they were consulted by expert priests.

Viracocha was the supreme god of the Inca. The Spanish missionaries—monotheists and monogenists—would have liked to make him or perhaps Pachacámac into a creator god who was unique, abstract, and infinite. But in Andean thought, each tribe had been transformed (rather than created) from water, earth, animals, and so forth, by a particular god at the beginning of a cosmic cycle, and the role of all deities was to have given, and to continue to give, the breath of life and strength (*cama*) to humankind and to nature.

Viracocha was one of these personified gods. He was also a complex deity and was thought of as both one and many, the principle of transformation. Two others of his names were Con-Ticsi-Viracocha and Pachayachacich (“he who gives order to the world”) and he had a large family with several sanctuaries. Viracocha was associated with water and the foam of Lake Titicaca, whence he had come, and with the foam of rivers and the surface of the ocean, where, according to some myths, he (in human form) disappeared to the northwest, walking on the waves. These attributes associ-

ated him with the rainy season, and others made him the representative of the fire of the heavens and of the triumphant Sun. Under the name of Huari Viracocha (an androgynous being) he was able to draw to himself all the cosmic functions of the upper and lower worlds. He had created the sun, the moon, the stars, and the prototypes of the Andean tribes—including the Inca—thus separating night from day and ushering in the solar cosmic cycle, which he entrusted to the Inca Manco Capac. The latter, accompanied by his brothers and sisters (the Ayars), was plunged into the earth by Viracocha and reemerged from the central window of Pacaritambo, to the south of Cuzco, at dawn, in order to reflect the first appearance of the sun. Viracocha’s sons, Imaymana and Tocapu, taught the Andeans the names and virtues of the flora and fauna. Their travels, like Viracocha’s, may have corresponded to astronomical observations.

Some prayers to Viracocha have been preserved. Around 1575, a number of prayers were recorded by Fray Cristóbal de Molina (collected in *Las crónicas de los Molinas*, Lima, 1943). The first of these may be rendered in English as follows:

O Creator, you who are at the ends of the earth, peerless, who has given being and force to men, who has said, “Let this one be man and that one be woman.” You made them, you gave them shape, you gave them being. Let them live in health, free from danger, in peace. Wherever you may be, whether up in the heavens, below with Thunder, or with the clouds of the storm, listen to me, answer me, grant me my prayer, give us eternal life. Keep us forever in your hand. This offering, receive it, wherever you are, O Creator.

INCA RITES. The Inca was considered to be the son of the Sun and the Earth, Viracocha’s chosen one and equal. In this world, between the two vertical halves of the cosmos, he was the synthesis of their opposition, acting as center and mediator. A *huaca* himself, he had ambiguous powers over the *huacas*, with whom he either negotiated or made war. He contributed to the upkeep and vigor of the cosmic cycle in which he lived by seeing that the order of Pachayachacich was respected. Specialized priests (for such matters as divination, interpreting oracles, making sacrifices, hearing confessions, etc.) conducted the rites that measured the cycles of agriculture and husbandry, which were spread throughout the year, and which corresponded to the solstices and equinoxes, the alternation of rainy (October to March) and dry seasons, and the alternation of day and night. Each month a particular segment of Cuzco society dedicated itself to the prevailing cult. One of the most important festivals was Hanan Raymi (held at seedtime in December), during which the initiation rites of the young nobility took place, and after which the Citua was celebrated to expel the illnesses brought on by the rains. Another important ceremony was Inti Raymi, which took place at harvest time in June.

The great religious ceremonies were publicly celebrated in Cuzco. The sacrifices were designed to nourish and placate the gods, and offerings were selected from the great comple-

mentary ecosystems of nature (plants, birds, shells, the blood of animals—particularly llamas—and humans) and culture (maize, coca, pepper, corn beer, cloth, statuettes). At the center of the ceremonial place was the *usnu*, a small edifice on which the Inca sat enthroned and that was pierced at its base by underground canals leading to the temples of Viracocha, the Sun, and Illapa. Here the Sun was given “drink,” which acted to placate and balance the powers of the lower and upper worlds. The *usnu* may also have served as an astronomical observatory. The golden statues of Viracocha, the Sun, and Illapa, the silver statue of the Moon, and the mummies of dead sovereigns—or their replicas—were set out on ceremonial occasions.

The performance of these ritual duties was also intended to ward off cataclysms (*pachacuti*), especially those caused by excessive heat (“suns of fire”) or water (floods). Such cataclysms were believed to result from the dissatisfaction of the cosmic powers of the upper and lower worlds. They were believed to have occurred before, ushering in new cycles, and it was thought that they could happen again. These ideas, which were based on the observation of the movements of the sun and moon and the oppositions of day and night, dry and rainy seasons, and fire and water, were projected through time to construct an explanation of the history of the world. In any case, the important Quechua word *pacha* means both “time” and “space.”

CONCLUSION. It is impossible to show in this short essay the wealth and the complexity of the official Inca religion, which was itself superimposed over the no less rich religions of the conquered provinces. Religion imbued and governed all private and public activities of the Andean people. Daily tasks and major undertakings alike were performed with equal passion and competitive spirit, for the dualism of the religion imparted its dynamism to society. The great ritual festivals of participation and communion involved the population from the capital as well as that from the countryside, thus assuring the cohesion of the social and ethnic groups of the empire. The deification of power guaranteed its intangibility and the stability of the social order. Finally, it is known that piety was general, and that members of the elite did not hesitate to offer their children for sacrifice.

To be sure, no Andean religious books exist. But there is much to discover in the colonial documents. Recent years have seen considerable progress, especially in scholarly knowledge of Andean astronomy. Religion, culture, and philosophy were built around several fundamental ideas: the opposition of contraries, the search for their conciliation in a harmonious equilibrium, and concern for the natural and human laws, which religion had as its object to predict and to regulate.

But this religion also had its failings in regard to the social order, owing especially to the importance attributed to the oracles and to the divinization of the Inca, factors that certainly facilitated the conquest of the empire by the Spaniards. Given the present state of Andean studies, it is difficult

to talk about theology in connection with Inca religion. One can, however, speak of a complex metaphysics in connection with the major god Viracocha, the conception of whom was forced to enrich and complexify itself during the final days of the empire.

The religious spirit of the Andeans revealed its full intensity after the Spanish conquest, especially in the cruel but vain attempts to make the indigenous priests confess the locations of hidden treasures. After the official religion had been forbidden and destroyed by the invaders, after it had disappeared with the empire, the rural religions, which in general antedated the Inca conquest, continued to be practiced secretly despite the fierce assaults of the itinerant Inquisition upon the Indians. During the colonial centuries, the indigenous religions formed the core around that crystallized the spirit of resistance and the preservation of the cultural identity of the Andeans.

INCARNATION. The concept of incarnation (Lat., *incarnatio*, "being in flesh") has been applied in the Christian community to the mystery of union between divinity and humanity in the person of Jesus Christ. More generally, the concept has been extended to take into account a variety of forms of incarnation that the history of religions has described in various lands and among different peoples. The term *incarnation* is broadly defined here as the act or state of assuming a physical body (as a person, an animal, a plant, or even an entire cosmos) by a nonphysical entity such as the soul, the spirit, the self, or the divine being.

Typologically speaking, there are two sharply contrasting evaluations of incarnation. One of them is a tragic view,

according to which the union of the soul, the spirit, or the self with the world of matter, hence with the physical body, is interpreted as a fall from its proper place into an alien abode, an imprisonment, or an enslavement. Salvation consists, according to this view, in the soul's escape from the world into which it has fallen by dissociating and liberating itself through purifications, rites of initiation, or meditation, from the chains of its captivity. There is, on the other hand, a positive interpretation of incarnation, which sees the assumption of a bodily form by the soul, the spirit, or the divine being as occurring for the purpose of saving or sanctifying the phenomenal world. This type of bodily manifestation is seen, for example, in the leaders of small tribal communities, the founders of religions, and the heads of theocratic states. In a certain sense, the history of religions has been the history of persistent battles fought between these two distinctive visions of the incarnation.

THE "PRIMITIVE" TRADITION. The belief in the divine incarnate can be attested as early as the late Paleolithic period, in a considerable number of pictures of human beings in animal forms, often in dancing posture. Among the best known is a figure of the "great sorcerer" in a Trois Frères cave, sporting a deer's head crowned with huge antlers. The same cave has also preserved the portrayal of a dancer disguised as a bison, playing a bow-shaped instrument, possibly a kind of flute. It is certain that the early hunters wore masks and skins of animals for the celebration of their magico-religious ceremonies. These masked figures and many parallel examples were probably believed to be the incarnations of spirits or divine beings akin to the Lord of the Animals.

Wearing masks has been one technique for incarnating souls or spirits in premodern societies. In Inner Asia, for example, a shaman's mask symbolizes the incarnation of a mythical personage (ancestor, mythical animal, or god). For its part, the costume transforms the shaman into a spiritual being. In Polynesia and Melanesia, the souls or spirits of dead ancestors are believed to come from the land of the dead at certain fixed times, especially when the old year passes into the new year. They appear in disguise, wearing terrifying masks and strange costumes; the "dead" call on villagers, praising them for their good conduct and rebuking them severely for any wrongdoing they have committed. The "dead" also perform the rites of initiation for young novices. Finally, they give blessings for a good crop in the coming months and, after receiving hospitality from the villagers, return to their homeland far across the sea. In fact, the spirits of the dead are impersonated by members of secret societies (e.g., the Dukduk of the Bismarck Archipelago, the Arioi of the Marquesas Islands), but these awe-inspiring "sacred visitors" wield such terror over the noninitiated that they are truly believed to be the incarnations of the ancestral spirits. Significantly, the arrival of the spirits from the world beyond announces the renewal of time, the advent of the new year, and the renovation of the entire universe. A similar belief in the sacred visitors (*marebito*) is also attested in Japan.

The belief in the preexistence and incarnation of souls is abundantly documented in the “primitive” world. According to the Caribou Inuit (Eskimo), for example, the immortal soul of a dead person leaves his body, ascending to the supreme being Pinga in heaven who receives it. If the person lived properly according to the rules of life, Pinga lets the soul assume a bodily form, human or animal. Such a belief is also widespread among the North American Indians. Especially noteworthy is the belief found among the Aranda in central Australia, according to which every human being has two souls: the mortal soul, which comes into being with the fetus as a result of intercourse between the parents, and the immortal soul, which predates and really creates the entire human personality. More concretely, the immortal soul is a particle of life of the totemic ancestor who unfolded his sacred history in the beginning of mythical time; every individual is what he is today because of the incarnation in him of the immortal soul, a spark of his primeval ancestor’s life. The Aranda becomes aware of this mystery of life as he undergoes the rites of initiation, in which he learns the sacred history of his ancestors. It is a sort of anamnesis, a remembering of the preexistence of his immortal soul in the mythical sacred history—a recollection accompanied by the acute realization of the immortal soul’s involvement in temporary, phenomenal existence.

GREECE, INDIA, IRAN. The ancient Greek doctrine of metempsychosis presupposes the incarnation of preexistent and immortal souls in successive bodies, human and animal, and even in inanimate substances. Pythagoras certainly believed in the transmigration of souls (Xenophanes, frag. 7); according to him, the human soul, despite its immortality, has been imprisoned in the body and condemned to a cycle of reincarnation due to the fall from its original state of bliss. A similar idea was held by Empedocles: The immortal human soul has fallen from its proper abode into the world, into the physical body, due to its primal sin. Condemned to the physical world, the fallen soul is destined to wander through a series of incarnations until it is restored to the primeval state of bliss from which it has fallen. Plato contrasts the immortal part of the soul, which the Demiurge has created, with the mortal part, including perception, which is added by the created deities at the moment of union with the body (e.g., *Timaeus* 69c–d). Immediately before incarnation, the immortal soul drinks from the waters of Lethe (“forgetfulness”); “burdened with a load of forgetfulness and wrongdoing,” the soul “sheds her wings and falls to the earth” (*Phaedrus* 248c), that is, it falls into the physical world, into the body that is a “tomb” (*Gorgias* 493c), imprisoned by the cycle of becoming and incarnation. But, it is still possible for the immortal soul to learn, to recall its extraterrestrial experience of the perfect condition that existed prior to the fall (cf. especially *Meno* 81c–d). For Plato, to live fully and meaningfully is, after all, to remember a discarnate, purely spiritual existence; it is an anamnesis of the soul’s true identity, that is, a recognition of its heavenly origin.

This Greek mythology of the soul, more or less hostile to the world of matter and the physical body, was incorporated into Gnosticism, a set of doctrines characterized by anti-cosmic dualism. Humankind, as viewed by the Gnostics, is constituted by three components: the self, the soul, and the body. The physical body belongs to the deficient world of nature (*phusis*), but the soul is also part of this evil world. Psychic human activities arise from and are limited by the continual flux of natural events. It is only the self that transcends the evil world. It is divine in nature, hence not subject to time and change; it is indestructible. Where is the original home of the divine self, the spiritual part of humanity? The Gnostic myth narrates, with manifold variations, the fate of the self, its origin in the world of light, its tragic fall into the alien world, and its imprisonment in the physical body. Salvation consists, in the last analysis, in the emancipation of the self from the dark world of matter and the physical body and its return to its genuine home, the world of light.

India presents a doctrine similar to gnosticism, namely, Sāṃkhya-Yoga, whose central message may be summed up as follows: (1) humanity’s destiny in the world is conditioned by the mysterious interplay between the self (*puruṣa*), which is indestructible, eternal, and not subject to change, and matter (*prakṛti*), which is subject to time and transformation and which constitutes humankind’s psychophysiological complex; (2) the self is essentially a stranger to the world of matter, into which for unknown reasons it has fallen and been enslaved, resulting in the oblivion of its original, true identity; and (3) deliverance (*mokṣa*) begins when the self remembers its eternal freedom and tries to dissociate itself through the practice of yoga from the world of matter.

However, in India the tragic view of the incarnation coexists peacefully with another, more positive view. The Hindu god Viṣṇu, out of his profound concern for the welfare of the universe, has frequently embodied himself wholly or partially in the phenomenal world. According to one of the earliest versions of the doctrine contained in the *Bhagavadgītā*, he incarnates himself in the person of Kṛṣṇa, but he is also able to manifest himself in other bodily forms, human and animal. “Whenever the law of righteousness withers away,” Viṣṇu declares, “I come into being age after age for the protection of the good, for the destruction of evildoers, and for the setting up of the law of righteousness” (*Bhagavadgītā* 4.7–8). While Hindu myths and rituals have concentrated attention on Viṣṇu’s ten primary incarnations, in some formulations four saviors appear as his *avatāras*, or incarnations, each ushering in one of the four cosmic ages constituting a *mahāyuga*, a complete cosmic cycle. In the *kṛtayuga*, which lasts 4,800 divine years (with one divine year corresponding to 360 human years), Viṣṇu makes his appearance as the sage Kapila, while in the *tretāyuga*, lasting 3,600 divine years, he appears as the universal monarch Cakravartin. In the third cosmic age, *dvāparayuga*, of 2,400 divine years, the supreme being incarnates himself as the sage Vyāsa, and in the final cosmic age, *kaliyuga*, lasting 1,200 di-

vine years, he will manifest himself as Kalki, a sort of messianic figure who will come in glory to establish the golden age, judging the wicked, rewarding the virtuous, and ruling over the entire universe in peace and prosperity.

The ancient Iranians of the Parthian period had an ardent hope or expectation for Mithra incarnate, who would come at the end of the world as the great universal monarch and savior. This king and savior will descend on the Mount of Victories in the form of a column of light or a shining star to be born in a cave. He will be given birth by a human mother, but in truth he is of heavenly origin; he descends from above with the light, that is, he is the child of light. There were, in fact, magi who lived near the Mount of Victories; every year, at a certain fixed date, they climbed the mountain in which there was a cave, and quietly prayed to the heavenly god for three days, waiting for the appearance of the star.

KINGS, EMPERORS, IMAMS. The status of kings was often defined in terms of God incarnate. In ancient Egypt, for example, the king was believed to be divine in essence. His coronation, usually celebrated at the beginning of the new year, signified not an apotheosis but an epiphany, a self-manifestation of the god. As long as he ruled, the king was identified with the god Horus; in fact, he was Horus incarnate in his early existence, but upon his death he was mystically assimilated to Osiris, the god of rebirth and immortality.

The Greco-Roman world generally dissociated itself from the notion that the king was the incarnation of a certain god, despite the fact that royal titles such as *The Young Dionysos* and *Epiphanes* were often used by kings in the Hellenistic period. According to Arthur Darby Nock, the only exception was Ptolemy XIII of the mid-first century BCE, who demonstrably considered himself to be Dionysos incarnate, probably under the influence of the pharaonic conception of the king as Horus incarnate.

While the Chinese emperor was generally called Son of Heaven (*tianzi*) and as such was considered the earthly representative of Heaven or heavenly will, some emperors were regarded as incarnations of the Buddha. For example, the founder of the Northern Wei dynasty (386–534), Taizi, was regarded by the eminent monk Faguo as the Tathāgata in person, an incarnation of the Buddha. This idea was iconographically represented in the caves of Yungang to the west of Datong, the capital of the empire until 494. Moreover, toward the end of the seventh century the Empress Wu Zhao, who was a strong supporter of Buddhism, was considered to be the incarnation of Maitreya, the future Buddha. Among the Tibetans, the Dalai Lama has been accepted as an incarnation of the bodhisattva Avalokiteśvara.

In ancient Japan, the emperor was explicitly called the *akitsumi kami* (“manifest *kami*”), that is, the god who manifested himself in human form in the phenomenal world. The essential part of the Japanese conception of sovereignty was

the belief in the emperor’s heavenly origin, and this belief was clearly expressed in the myths of Ninigi, the grandson of the sun goddess Amaterasu. Ninigi is born in the heavenly world and then descends onto the summit of Mount Takachiho, carrying the three items of the sacred regalia as well as the heavenly mandate guaranteeing his eternal sovereignty on earth. The emperor was identified with this mythic figure at the annual harvest festival as well as on the occasion of his enthronement festival.

In Islam, more particularly among the Shī‘ah, the imam enjoyed a truly exalted and significant status; while among the Sunnīs an imam is no more than a leader of congregational prayer at a local mosque, among the Shī‘ah the imam was endowed with a power at once political and religious. Like the caliph, he was one who ruled the community in mercy and justice, but unlike the caliph, who had no legal authority, the imam was empowered to interpret the *ḥaqīqah*, or esoteric meanings of the Qur‘ān and Islamic law. This power was based on the Shī‘ah conviction that Muḥammad’s charisma, or spiritual gift, which he received from God, would be transmitted genealogically only within his household. It was natural that the imam became the central focus of Shī‘ah faith to such an extent that he was believed to be the embodiment of the divine light. Some extreme sects of the Isma‘īlī movement went even further in believing that the imam was the incarnation of the godhead itself. The Druze of the Lebanon Mountains hold the Caliph Ḥākim (r. 996–1021) of the Fatimid dynasty in Egypt to be the incarnation of the godhead, now in concealment but with the promise of a return.

BUDDHISM. Buddhism was founded by Siddhārtha Gautama of the Śākya clan in India, who left his home in quest of truth, devoted himself to the practice of meditation, and finally attained enlightenment. Hence he is also called the Buddha, the Enlightened One. During the early centuries of the history of Buddhism, this historical Buddha commanded the primary attention of Buddhists.

However, as a new trend of the Buddhist movement called the Mahāyāna developed in the course of the second century BCE, a shift occurred in Buddhology; emphasis was now placed less on the historical Buddha than on the Eternal Buddha. This Eternal Buddha is transcendent, absolute, and infinite, embodying the universal and cosmic truth. Hence he is called the *dharmakāya* (“body of the law”), the essential Buddha who is the ultimate reality as viewed by Mahāyāna Buddhism. The Eternal Buddha does not wish, however, to hold himself aloof from the phenomenal world; out of his deep compassion for humanity in pain and suffering he has incarnated himself in the person of Siddhārtha Gautama, as the *nirmāṇakaya* (“body of transformation”).

This doctrine is elaborated, for example, in the *Saddharmapuṇḍarīka Sūtra*, also known as the *Lotus Sūtra*. The scripture presents the Buddha in two aspects: his absolute aspect in the form of the Eternal Buddha, which is dealt with in the section following chapter 15, while the section

preceding this chapter is concerned with his relative aspect in the person of the historical Śākyamuni Buddha, who assumed human form for the sake of benefiting all sentient beings. According to the doctrine of the “Tendai school” in medieval Japan, the absolute and the relative are in essence qualitatively equal; they represent the two different aspects of the Buddha but, in reality, are one and the same.

Japanese Buddhism, more particularly, the Shingon school of Buddhism, has also unfolded what may be called a cosmotheism, a fascinating conception of the cosmos as the embodiment of the Buddha Mahāvairocana. The place of central importance in Shingon Buddhism is occupied no longer by the historical Buddha but rather by the Cosmic Buddha Mahāvairocana (Jpn., Dainichi, “great sun”); just as the sun is the source of light, illuminating the whole universe and giving life to all forms of existence, so Mahāvairocana is the Great Illuminator of all existence, both animate and inanimate. He is transcendent, absolute, and eternal because he is identified with the *dharmakāya*. However, Mahāvairocana is not only transcendent but also immanent in the universe. This Buddha is cosmic in nature because, according to Shingon Buddhism, he embodies himself in the six great elements constituting every form of existence in the universe: earth, water, fire, wind, space, and mind. These six elements are interfused and in a state of eternal harmony. In fact, the whole universe is viewed as the “*samaya* (symbolic) body” of the Buddha Mahāvairocana. When the universe is referred to as the Buddha’s *samaya* body, it means two things at the same time: First, the cosmos symbolizes and points to the ultimate reality, Mahāvairocana identified with the *dharmakāya*; and second, while the ultimate reality embodies itself in the cosmos, for its part the cosmos participates substantially in the ultimate reality itself. Accordingly, the cosmos is a sanctified world endowed with the quality of the sacred, assuming profound soteriological value.

CHRISTIANITY. That God was incarnated in the person of Jesus of Nazareth in order to save humankind is a basic tenet of Christianity. One of the earliest confessions of faith pronounced by the primitive church (*Phil.* 2:6–2:11) speaks of the preexistent divine figure Christ Jesus, who condescended to take on human form, won victory in his death over the cosmic forces of evil, and reigns now with God in heaven. In the *Gospel of John*, dating from the end of the first century, Christ Jesus is presented as the incarnate Word (Logos) of God (*Jn.* 1:1–1:14). In sharp contrast to the portrait of the life of Jesus in the synoptic Gospels, John identifies him as the preexistent divine being who, descending from heaven, moves mysteriously through human life, proclaiming heavenly messages and working miracles, and who even foretells his ascension to heaven following his impending suffering and death. John’s language may sound preeminently Gnostic, but the content of his central message, namely, that the divine Logos had become human flesh, was certainly anti-Gnostic.

Christian Gnostics accepted the belief that Christ was the divine Logos, the chief intermediary between God and

humans. However, they rejected the idea that the Logos took on human flesh, because to them the flesh was both evil and insubstantial. Characteristically, they denied the reality or historicity of the incarnation: The human life of Christ was spiritual but not material; Christ hovered over mortal life, never really participating in the birth, suffering, and death of the historical Jesus. The Christian church set itself against this docetic view in such affirmation of the Apostles’ Creed as “God the Father Almighty, creator of heaven and earth.” By implication this was an affirmation of the goodness of all God’s creation, material as well as spiritual. Similar affirmations concerning Jesus’ birth, suffering, and death were directed against the Gnostic denial of the incarnation of Jesus Christ. Moreover, the assertion in the Apostles’ Creed of the resurrection of the dead affirmed the salvation of the whole person and not merely the discarnate soul, spirit, or self. It is thus significant that Christian orthodoxy affirmed the humanity of Christ and the goodness and reality of the cosmos against Gnosticism and any form of the Gnostic view of man and the universe. “After the Incarnation,” Mircea Eliade states in his *Myth and Reality* (p. 172), “the World has been reestablished in its original glory.” The phenomenal world, humanity’s world, the world as it is, is a *sanctified* cosmos because Jesus Christ the Savior has dwelt in it.

The Christian church attempted to articulate the nature of the person of Jesus Christ as God incarnate at the First Council of Nicaea (325). It adopted a creed that included such phrases to define Christ as “begotten not made,” “begotten before all ages,” and “of one essence with the Father.” Thus Christ was declared to be *homo-ousios*, “consubstantial,” with God the Father, a doctrine that was to be formulated later by Augustine as *una substantia tres personae* (“one substance in three persons”); Christ was essentially divine without being a kind of “second God.” Once this result was generally accepted, a further question arose: How are the divine and human elements related to each other in the person of the historical Jesus? After apparently endless debates and anathemas, the orthodox view was formulated at the Council of Chalcedon (451): Two natures of Christ, divine and human, are perfectly blended in one person; Jesus Christ is *vere Deus vere homo* (“truly God and truly man”).

TWENTIETH-CENTURY VIEWS. While the affirmative view of incarnation has apparently won the victory, the tragic view of the destiny of the soul, as it was classically expressed by Plato, Gnosticism, and Sāṃkhya-Yoga, is far from dead; on the contrary, it has often asserted itself ever since. In fact, as Martin Buber has aptly stated, human self-understanding has gained “depth” in those crisis periods in history when humankind has felt homeless in the physical world in which it lives, becoming aware of its acute alienation from the world. The twentieth century, one such crisis period, demonstrated a keen interest in the Gnostic outlook on life and the universe, as it is reflected in the writings of C. G. Jung, Hermann Hesse, and Martin Heidegger. For Heidegger, for example, the world is no longer a home for modern humankind but an alien realm; humanity is homeless in the

world. Moreover, humankind lives in a period of cosmic night, and the darkness of this cosmic night is to continue for some time. According to him, the soul is not in its proper place in this evil world; here, it is a stranger, imprisoned in the physical body. The soul is destined to leave this world behind and, becoming “a blue soul,” to set out for the dark wandering, journeying toward the land of the evening.

BIBLIOGRAPHY

There is no single book dealing with the problem of incarnation in the general history of religions. On masks and their religious meaning in prehistory, see Johannes Maringer's *Vorgeschichtliche Religion: Religionen im steinzeitlichen Europa* (Einsiedeln, Switzerland, 1956), pp. 184ff., edited and translated by Mary Ilford as *The God of Prehistoric Man* (New York, 1960), pp. 146ff.

Hutton Webster offers basic information on the periodic return of the ancestral spirits in Polynesia and Melanesia in his *Primitive Secret Societies* (New York, 1980). On the Aranda conception of the immortal soul, there is a fascinating account in Mircea Eliade's *Australian Religions: An Introduction* (Ithaca, N.Y., 1973), pp. 44–59.

The incarnation of the soul in the Greek philosophical tradition has been competently discussed by W. K. C. Guthrie in *The Earlier Presocratics and Pythagoreans* (pp. 306ff.) and *The Presocratic Tradition from Parmenides to Democritus* (pp. 249ff.), volumes 1 and 2 of his *A History of Greek Philosophy* (Cambridge, U.K., 1962 and 1965). The best single book on the Gnostic view of the destiny of humankind and its immortal soul in the world remains Hans Jonas's *The Gnostic Religion*, 2d ed., rev. (Boston, 1963). On Sāṃkhya-Yoga, there is a concise account in Robert C. Zaehner's *Hinduism* (London, 1962), pp. 67ff. Focusing his attention on the fate of the immortal self in the world, Mircea Eliade has compared Gnosticism with Sāṃkhya-Yoga in his essay “Mythologies of Memory and Forgetting,” now included in his *Myth and Reality* (New York, 1963), pp. 114–138. There is a fine comparative study of the avatar beliefs of India and the Christian doctrine of the incarnation in Geoffrey Parrinder's *Avatar and Incarnation* (New York, 1970).

The eschatological expectation of the birth of the savior Mithra in ancient Iran has been elucidated by Geo Widengren in his *Iranisch-semitische Kulturbegegnung in parthischer Zeit* (Cologne, 1960), pp. 62–86. See also Mircea Eliade's *Méphis-tophèles et l'androgyne* (Paris, 1962), pp. 60ff., translated by J. M. Cohen as *The Two and the One* (Chicago, 1965), pp. 51–55.

Major problems of Greco-Roman kingship have been discussed authoritatively by Arthur Darby Nock in volume 1 (pp. 134ff.) and volume 2 (pp. 928ff.) of his *Essays on Religion and the Ancient World* (Cambridge, Mass., 1972), with an introduction by Zeph Stewart. On the conception of kingship in ancient Japan, see my article “Sacred Kingship in Early Japan: A Historical Introduction,” *History of Religions* 15 (1976): 319–342.

Mahāyāna Buddhism has attempted to explain the historical Buddha Śākyamuni as an incarnation of the Eternal Buddha. See,

in this connection, a brief but illuminating account of the doctrine of the “three bodies” (*trikāya*) of the Buddha by T. R. V. Murti, *The Central Philosophy of Buddhism*, 2d ed. (London, 1970), pp. 284–287. On the conception of the cosmos as the embodiment of the Buddha Mahāvairocana, see *Kūkai: Major Works*, translated, with an account of Kūkai's life and a study of his thought, by Yoshito S. Hakeda (New York, 1972), pp. 76ff.

On the history of the Christian doctrines of the incarnation, there is an admirable account by Jaroslav Pelikan in *The Emergence of the Catholic Tradition, 100–600*, volume 1 of his *The Christian Tradition* (Chicago, 1971).

Revised Bibliography

INCENSE. The term *incense* (from Latin *incendere*, to burn or kindle) has the same meaning as the word *perfume*, i.e., the aroma given off with the smoke (*per fumar*) of an odoriferous substance when burned. Incense may then be associated with the perfume arising from the burning of substances that produce a pleasant odor. Aloe, camphor, cloves, sandalwood, myrrh, frankincense, cedar, juniper, balsam, galbanum, and turpentine have been used as incense. Since ancient times incense has been an important part of religious rites and practices in various regions of the world. Incense has been used to appease the gods, sanctify a place or an object, display reverence and respect, honor commitments, tie bonds, and seal promises and friendships. Valued as a precious commodity, it was offered as a gift to honored personages: Frankincense and myrrh were two of the gifts the wise men of the East brought to the infant Jesus.

In association with concepts of purity and pollution, incense plays a major role in purification rites and customs. Incense smoke is used for these purposes because of the transforming powers of fire, as well as the seemingly purificatory powers of sweet smells. Because its fragrance is thought to be pleasing to the gods, incense has played an important role in worship and is used in ceremonies of offering, prayer, in-

tercession, or purification. It is used to attract the attention of, or establish a connection with, a deity and is also used to exorcise evil or harmful forces.

THE FAR EAST AND INDIA. In Chinese, the word *xiang* can mean both “aromatic” and “incense.” In China incense was sometimes burned in conjunction with aesthetic enjoyments like reading, writing compositions, or performing music; in Japan it was an important part of the tea ceremony. In Chinese Daoism, incense was used to disperse evil and to appease the gods; it was also employed in rituals for the cure of disease. Considered a punishment for evil deeds committed by the sufferer himself or by an ancestor, illness was regarded as a punishment by the San Guan (Three Officials), the judges and officials of the dead. During the rituals for curing sickness, a formal appeal was made to mitigate and revoke the officials’ judicial severity. Using the rising flame and smoke from the incense burner in the center of the oratory to transmit a message borne by spirits exteriorized from within his own body, the Daoist libationer submitted petitions (*zhang*) to the appropriate bureau of the Three Heavens (San Tian), where officials pronounced judgment on the appeal and marshaled celestial forces against the offending demons responsible for the illness. Incense played a major role in another Daoist ritual for fending off disease, the Mud and Soot Retreat or Retreat of Misery. The ritual was usually performed outdoors at a specially delimited sacred area, or altar (*tan*). It was a ceremony of collective contrition where the combined effects of clouds of incense, the light of many lamps, and the sound of the chanted liturgy produced a cathartic experience in the participants.

Incense is also central to the Daoist Jiao liturgy, which renews the community through communication with the gods. Jiao rites may be held for the ordination of priests or the birthdays of gods or may be held to ward off calamities. For the Jiao ritual, a village feast is held outside the temple, and an esoteric liturgy is performed inside the closed temple. In the temple ritual the main incense burner, the central object in the temple, is the focus of the rite. A symbolic incense burner is “lighted” inside the body of the main priest, whose meditation transforms him into a mediator with the divine and makes possible the efficacy of the rite. Incense is employed for the ecstatic symbolic journey to heaven performed inside a sacred area demarcated by five buckets of rice. Together with the burning incense, a document is burned (“sent off to heaven”) as a “memorial to the throne” (*zhang*), which announces to Heaven the performance of the liturgy.

Incense also forms an important part of the Buddhist ritual ceremonies in Korea. When taking the vows of Buddhist priesthood, young initiates undergo a rite called Pul-tatta, or “receiving the fire.” In this ceremony a moxa, or cone of burning incense, is laid upon the arm of the novice after the hair has been shaved off; the ignited cone is then allowed to burn slowly and painfully into the flesh. The remaining scar is considered a mark of dedication and holiness and commemorates the ceremony of initiation. Incense is

used in ancestor worship as well; tablets containing the names of the departed written in gilt and black characters are placed on every household altar, where sacrifices are offered and incense burned.

At least until the late nineteenth century, incense time-keepers were used in Japanese Buddhist temples to mark the intervals at which the priest struck the great bell to call the people to prayer. The use of incense to measure time was an idea borrowed from China, and so in Japan these sticks were called “Chinese matches.” In China the first literary mention of incense being used as a time indicator appears in the sixth century, although it may have been used much earlier. It was widely used from the tenth century on. To make the time-keepers, hardened-paste incense was prepared in sticks or spiral coils and marked into hourly intervals. Depending on the season, the burning time of the sticks was usually between seven to eleven *ke*, one *ke* being equivalent to about a half an hour of modern time. Sometimes a continuous trail of powdered incense was marked off into equal lengths and burned to indicate how much time had passed. The legacy of using incense sticks as timekeepers has been transferred to Hawai’i, where many Japanese and Chinese have migrated.

In India, incense is used in both Hindu and Buddhist rituals. In Hindu rites it is offered in temples as an act of homage before the statue of the deity; in the *āratī* ceremony, for instance, the incense burner or stick is rotated before the image of the deity in order to make an offering and evoke blessings. Fragrant incense was also used to waft prayers to the gods and to drive off foul-smelling demons.

THE ANCIENT NEAR EAST. In ancient Egypt, incense was frequently used in cultic rituals. According to Plutarch, the Egyptians burned incense to the sun three times a day; Herodotus recounts that incense was daily burned before an image of a cow. Sacrifices were offered to the pharaoh, and incense was burned before him in the coronation procession. The importance of offering incense is evident from the title of a courtly official, the “Chief of the House of Incense.” It was also an important element of funerary practices, because the soul of the dead was considered to ascend to heaven by the smoke of the burning incense.

Incense also figures in Mesopotamian mythology. In the Mesopotamian *Epic of Gilgamesh*, Gilgamesh’s mother Ninsuna supplicated the gods, asking them to protect and befriend her son. She burned incense and offered it to the god of creation, Shamash, to show her reverence and receive his blessings. As Gilgamesh embarked on his mission to kill the Evil One, Huwawa, he heard the words of his mother and remembered the fragrant aroma of the incense.

JUDAISM, CHRISTIANITY, ISLAM. According to the Hebrew scriptures, in ancient Israel incense was considered a holy substance and was reserved for Yahveh; it was included with the bread offered to him on the Sabbath (*Lv.* 24:7). Incense was placed in the Tent of Meeting (*Ex.* 30:34) and was used in the offerings of the first fruits (*Lv.* 2:15–16); it was offered in censers on the Day of Atonement when the high priest

appeared before the mercy seat (*Lv.* 16:12ff.). Its use as a perfume is indicated in *Song of Songs* 3:6, which states that it was used to scent Solomon's couch. In Psalm 141 incense is likened to prayer.

Until the time of Constantine, incense was not used in public worship ceremonies of the Christian church. Its use as an offering was severely condemned by the early Fathers (e.g., Cyril of Alexandria and John Chrysostom) because of its association with pagan practices. Christians were identified by their refusal to burn incense before a statue of the emperor; Saturninus and Sisinnius were martyred for their refusal to do so. Those Christians who capitulated in order to escape death were known as *turificati*, or burners of incense. However, by the ninth century incense was used in some churches for the dedication and consecration of the altar. Incense was later incorporated into the liturgical services of both the Eastern Orthodox and Western churches.

In the Islamic tradition, incense is burned to create a pleasant aroma in places of worship, although it does not have any specific religious significance. The Muslims of India burn incense sticks on auspicious occasions such as weddings, births, or religious festivals. Incense is frequently offered at the tombs of saints, which people visit in order to obtain blessings. In the Šūfī *samā'* incense is often burned as the *dhikr* is chanted.

INCUBATION SEE ASKLEPIOS; DREAMS

INDIAN PHILOSOPHIES. Over the past four hundred years India has witnessed a break in its sociocultural and intellectual life with which it is still in the process of coming to terms. It is not, contrary to general belief, the legacy of colonialism that Indian philosophy and culture has had to contend with, but rather the compelling influence of the structure, rationality, and method of the European Enlightenment and its modernity. Since the eighteenth century, academic attempts at recovery of the classical tradition, efforts at translation, and philosophical analyses have all been mainly in the shadow of this modernity which separates as well as differentiates the study of science, politics and religion/metaphysics or *jñāna*, *karma* and *bhakti*.

Thus, contemporary scholarship in Indian philosophy is divided between, on the one hand, Indological enquiry engaged in the clarification and preservation of an "authentic" classical Indian philosophy, in all its details, and, on the other hand, an orientalist interest in appropriating the tradition to compare and compete with Western philosophy accepting the latter's standards and parameters of philosophical discussion. For a thorough and comprehensive history of Indian philosophy S. N. Dasgupta's five volumes titled *History of Indian Philosophy* (1922–1955) still represent the most systematic attempt. J. N. Mohanty's *Classical Indian Philosophy* (2000) is a lucid and independent exposition based on a classification according to issues in epistemology, ethics, or politics and religion. In *Presuppositions of India's Philosophies* (1991) by Karl Potter, the reader will find a serious attempt to consider and articulate the technical aspects of Indian philosophy in a manner in which they can address fundamental issues in philosophy and not be restricted to discussions within the tradition itself. Nevertheless, since a discussion of method and structure is lacking in these studies, even Potter's analysis does not ultimately succeed in bringing to bear the implications of what he himself characterizes as the speculative orientation of Indian philosophy towards the realization of freedom.

According to the *Sangarva Sūtra*, the Buddha classified his discussants into four categories—traditionalists, rationalists, metaphysicians, and experimentalists—and regarded himself as an example of the class of experimentalists (see Mohanty, 2000). It is this epistemological space for experiment within the framework of tradition that this article will attempt to trace.

THE STRUCTURE OF ORTHODOX AND HETERODOX SYSTEMS. Indian philosophy is generally thought to be comprised of six orthodox systems of thought—Nyāya, Vaiśeṣika, Sāṃkhya, Yoga, Mīmāṃsā, and Vedānta—and three so-called heterodox systems: Cārvāka, Jainism, and Buddhism. The orthodox schools are so described because they accept the authority of the Vedas, whereas the heterodox do not. However, the development of the schools is not linear and is characterized by a dialectical relationship entailing contradiction, correspondence, and complementarity, for which reason they are better approached as mutual elucidations rather than as a series of attempted improvements or revisions. Perhaps this is why they are called *darśanas*. Showing and seeing are both a part of the meaning of the term *darśana*; therefore, the term *revelation* appropriately defines it, implying the possibility of a plurality of revelations of the One.

Thus one may argue that the unity in plurality and plurality in unity of all religious traditions—Hindu, Muslim, Sikh, and Christian, vernacular and classical, and not merely of the six orthodox and three heterodox schools—defines the limit of Indian philosophy. The basis for this unity lies in the fact that they represent experiments with the method of non-dualism of knowledge, praxis, and faith. Gandhi was

not the first nor the last of the martyrs to testify to this in his writing and in his life. Dara Shikoh, the eldest son of Shahajahan, the Mogul emperor of India, held guilty of apostasy and martyred in 1609, wrote in the preface to his *Sirri-i-Akbar* (1067; a translation of the Upaniṣads) that it was his conviction that “the utterances of God elucidate and explain one another.”

The different systems represent attempts to understand the epistemological, cosmological, and metaphysical presuppositions that underlie the relation between the Origin and the universe, the Unmanifest and the manifest, and the Unity and the plurality. It may be argued that there is a division of focus between the schools: Nyāya and Vaiśeṣika address epistemological questions, the first from the point of view of the subject or knower and the other from the point of view of the object of knowledge. Sāṃkhya and Yoga are cosmological schools, the first addressing the question of the macrocosm and plurality, and the second, unity, the microcosm, and humankind as witness. Mīmāṃsā and Vedānta are primarily metaphysical systems, the former focusing on praxis or means and the latter on the nature of the end. The three sets can be seen as different modes of understanding the relation between God, man, and nature through *jñāna* (knowledge), *karma* (praxis), and *bhakti* (faith).

The Cārvāka school (founded prior to first millennium BCE), Jainism (founded in the sixth century BCE), and Buddhism (dating to the sixth century BCE) present vernacular critiques of the Vedic tradition. They consider the epistemological, cosmological, and metaphysical presuppositions of civil society and material culture, and do so with an emphasis on the vernacular, which is seen as capable of expressing not merely the lay but also the sacred, on custom, and on the crafts, as opposed to orthodox Hinduism’s focus on Sanskrit, tradition, and the sciences. Thus they lay the foundations for the tradition of the saints and the modern religions of Vīraśaivism (also known as Liṅgāyatism; founded in the twelfth century CE; in using the term *Liṅgāyatism* we are avoiding the usual orientalist opposition of Saivism versus Vaisnavism and drawing attention to the self description of the follower of this religion as the *the wearer of the liṅga*—which is the sign of the union of Śiva and Śakti), Sikhism (originating in the sixteenth century CE); and Gandhism (developed in the twentieth century CE). It may then perhaps be more apt to classify Indian philosophies according to their relationship to either the Śravaṇa tradition (of the hearers of the Word) or the Śramaṇa tradition (of the “laboring” devotee), rather than on the basis of orthodoxy or heterodoxy.

The focal point of Jainism’s critique is the recognition that the Truth is always relative to a point of view, even if it seems absolute from a particular perspective. The hegemony of a single tradition as custodian of the Truth is thus broken. Buddhism characterizes reality as suffering, and thus finds it essential to demonstrate the impermanence or momentariness (*kaṣaṇabhāṅgavāda*) of this reality, as the condition for the possibility of liberation (*nirvāṇa*) from it.

The Cārvākas are materialists representing the lay point of view. Knowledge of their perspective is mainly derived from representations made by philosophers who opposed them. They are characterized as infidels or sophists, or as proponents of a form of nature lore. This last description suggests that Cārvāka could be seen as representing a kind of metaphysical materialism that bridges the classical and vernacular traditions. Though Cārvāka rejects *mokṣa* (liberation) as a goal to be achieved outside and beyond this world, it asserts its possibility in this world, without the usual associations of pain and penance, associating it with pleasure instead. It is significant that the four elements—earth, water, air, and fire—are held to be eternal. The soul or consciousness does not exist independently of the body. It springs from a mixing of the elements that is characterized by their individual potencies, and that forms a fifth element, as it were. Formulated this way, Cārvāka philosophy can be seen as presenting a counter-Advaitic point of view. If Advaita argues the ultimate identity of the individual soul with *brahman*, the Unmanifest and transcendent principle of the universe, the Cārvākas argue the ultimate identity of the soul and the body, in this world, thus presenting the other limit of the spectrum. If the Mīmāṃsākas defend the potency of the Word, the Cārvākas defend the potency of matter. They together define the limits of the relationship between spirit and matter, the Word and the flesh, *mantra* (invocation) and *prasāda* (consecrated offering/partaking).

Thus Jainism, Buddhism, and the Cārvākas represent principles of civil society in their respective engagements with continence, the love of all creation being its positive force, suffering and its overcoming, and pleasure and its possibility in this world. All three schools are strongly critical of the ritualism of Hindu society and its making a travesty of the *varṇāśrama* classification of society, resulting in a rigid social hierarchy between *brahmins*, *kṣatriyas*, *vaiśyas* and *śūdras*. The *āśramas* refer to the different roles or stages that members of each of the *varṇas* pass through in life. Classical Hinduism talks of four *āśramas*: *brahmachārya* (of the novice), *gṛhastha* (of the householder), *vanaprastha* (of the recluse), and *sannyāsa* (of the renouncer of society). *Samnyāsāśrama* frees man from the laws that govern *varṇa*:

For the social system of caste was always surrounded in India by a penumbral region, as it were, of non-caste, where flourished the renunciatory religious orders whose principles abrogated those of caste, lineage, and birth: and the fourth *āśrama* (*saṃnyāsa*) constituted a door through which the individual was recommended to pass from the world of caste to that of its denial. The mutual relation of the two worlds, and I have no doubt that it was mutual, is of the greatest significance to a full understanding of either of them. (Uberoi, 1996, p. 14)

It may be argued that with the rejection of *varṇa*, Jainism and Buddhism followed a classification of society into only two classes, the monastic (*bhikṣu*) and the householder (*gṛhastha*), mediated by the congregation or *saṃgha*. Signifi-

cantly, the tantric tradition also holds that only these two *āśramas* characterize society in *kaliyuga* (Kālī age).

UNITY, PLURALITY, AND THE TRINITY. The term referring to the Unity or the One is Brahman. The conceptualization of its nature and role and the theological issues that surround it make Brahman in many ways analogous to Yahveh in the Judaic tradition, God in the Christian tradition, and Allāh in the Islamic tradition. Just as with these three traditions, a central concern of Indian philosophies has been to relate the one to the plurality that characterizes the manifest world. As with Christianity, Trinity mediates between Unity and plurality. In place of the trinity of the Father, the Son, and the Holy Ghost, the Vedic tradition posits the trinity of Brahmā, the Creator; Viṣṇu, the All Pervading (Spirit); and Maheśvara/Śiva, the Destroyer. Brahmā is the eternal conceiver of name and form that constitute the very essence of plurality in the universe. Viṣṇu is the breath of God, as it were, the Holy Spirit that pervades the universe and enables nature to reflect the attributes of its maker. Finally, Śiva is the destroyer not of the plurality of the universe as is generally believed, but of the duality of unity and plurality. Thus he is the beginning and the end, the first and the last, marking at once the destruction of plurality and the realization of Unity—as well as the destruction of Unity and its manifestation in the plurality. This is the theological role envisaged for Christ and Muḥammad who are in their respective religions mediator and intercessor, between God, humans, and nature.

Three possible relations between the Unity and the plurality emerge from this understanding of the Trinity, and these three positions are reflected in the points of view of the three major thinkers of the metaphysical schools of Vedānta, namely: (1) of the plurality emerging or being carved out of the Unity (the position held by Śaṅkara, of the Advaita school); (2) of the Unity and the plurality being independent realities, as it were, though bound by the Holy Spirit/*prāṇa* (the position held by Madhva, of the Dvaita school); and (3) of the Unity in the plurality (the position held by Rāmānuja, of the Viśiṣṭādvaita school).

The common reading of the Advaitic school is that it regards the universe constituted by name and form as a mere illusion (*māyā*). This leads to the misconception by contemporary scholars that the reality of this world must be forsaken to achieve identity of the individual soul (*ātman*) with Brahman. In fact Śaṅkara's position is that Brahman projects himself in the universe only in name and form. This of course implies that in reality He does not change or project himself but the statement has the added significance that Brahman, if he may be known in this universe, can be known only through name and form. To consider the universe of name and form as independent of Brahman is the illusion. Name and form are then neither real nor unreal, neither self nor not-self. Thus Śaṅkara effectively demonstrates the contradiction and complementarity, the difference and correspondence, that exist in the relation between Brahman and

the universe. In Swami Gambhirananda's translation of Śaṅkara's *Brahma-Sūtra Bhāṣya*, Śaṅkara writes:

Nothing but Brahman can be different from name and form, since the whole of creation consists of a manifestation of name and form. And the manifestation of name and form in an absolute sense is not possible for anything but Brahman; for the Upanishad mentions that Brahman is the agent of their revelation: "Let me manifest name and form by Myself entering as the individual soul." (1972, p. 239)

And Śaṅkara goes on to explain this further:

the intention here is to declare the identity of the individual soul and Brahman (and not agentship). From this very declaration of the manifestation of name and form, creatorship etc., as the indicative signs of Brahman become stated ipso facto. (1972, p. 239)

It may be argued then that to know name and form is to know them in their relation to the Unity/Brahman, which is to say to know them as a sign, symptom, or symbol (*liṅga*) of the relation between Unity and plurality. The name is a sign of the covenant between God, humans, and nature.

Depending on which type of relationship between the Unity and the plurality is assumed, names may refer either to substance, attribute, or relation. When plurality is seen to emerge from the Unity, names primarily refer to substance and there can be no real separation of substance and attribute. Śaṅkara thus posits that the essential nature of Brahman is such that a distinction cannot be made between substance and attribute, and for him the ultimate goal is the identity of the individual soul with Brahman. For those for whom Unity and duality are conceived of as separate realities, name and form may refer either to substance, to attributes of substance, or to relations between substance and attributes. Thus Madhva sees the possibility of attaining to three types of goals—of gods, seers, and humans, according to the merit of one's actions. These correspond respectively to the names of substance, of relations, and of attributes. For those for whom Unity exists in the plurality, all names and forms refer to a relation of the two. According to Rāmānuja, Brahman therefore has only auspicious attributes while the name and form of other objects in the universe may refer both to good or evil attributes.

Sāṃkhya, which means "number," characterizes the plurality of the universe as being constituted of *liṅgas* (specific combinations of the constituents of matter—*sattva*, *rajas*, and *tamas*) that in their turn individually associate with *puruṣa*, the spirit that is witness, enjoyer, and seeker of liberation, thus giving rise to a plurality of *puruṣas*/persons. The Sāṃkhyakārikā characterizes their relation thus: "From their association, the non-intelligent *liṅga* becomes intelligent as it were; and so too, though agency is of the constituents, the indifferent One (Puruṣa) becomes agent as it were" (Īśvara Kṛṣṇa [Īśvarakṛṣṇa], 1948, ch. 20, pp. 43–44). *Prakṛti* and *puruṣa* come together so that *prakṛti* ("nature") may be contemplated on through *liṅga* by *puruṣa* and so that *puruṣa* in

turn may be released from the three-fold misery that constitutes the universe; this is the necessary condition for the possibility of creation. Here the use of the term *liṅga*, indicating a particular form of the specific person evolving from this association, is significant since it points to the fact that it is only through *puruṣa* seeing himself in name and form that liberation is possible. According to Yoga, then, it is *liṅga* that is the object of meditation. Unlike knowledge by inference or testimony, *liṅga* refers to the determinate object and the individual soul, and not to something general. Such knowledge arising from the meditation upon the *liṅga* is “truth/reality-bearing.”

From this, one can argue that though it is a topic not given much attention in the secondary literature, the mediation between Brahman and the universe—or between transcendence and empirical existence—is the crux of the issue, and not the nature and reality or unreality of one or the other. Such mediation is achieved through the specific example (of *liṅga*) and its contemplation. Thus, knowledge of name and form as signs of this mediation is the basis of knowledge (*jñāna*), vocation (*karma*), and invocation (*bhakti*). It is not by accident then that the saints of the Bhakti and tantric traditions, the new religions of Liṅgāyatism (Virasairism) and Sikhism, and Mohandas Gandhi’s experiments with Truth, share a recognition of the potency of the name. Bhakti does not, as is generally believed, have its basis merely in experience, or simple faith, but in an understanding of the theory of names as the quintessence of the classical tradition and as crucial to the mediation between God, humankind, and nature—in other words, to the mediation of religion, politics, and science. This mode of prayer is considered to be available to men and women of all *varṇas*.

JÑĀNA, KARMA, AND BHAKTI. Philosophers like Karl H. Potter and Jitendra Nath Mohanty have attempted to find unity in the variety of systems that comprise Indian philosophy by claiming that they are all, with the possible exception of Cārvāka, metaphysical schools with the goal of achieving liberation or *mokṣa*. However, not all schools articulate such an engagement with *mokṣa* explicitly, nor are they all necessarily theistic. Other scholars attempt to make a distinction between the schools on the basis of whether a particular system follows the path (*mārga*) of *jñāna*, *karma*, or *bhakti*. Here the specific meaning these terms take on in a particular system is of importance. For instance, it is often said that Śaṅkara Vedānta accepts *jñāna mārga* and is of the view that all *karma* ceases when the identity of Brahman and *ātman* is achieved. It is only a sense of agency that assumes the distinction of subject and object that is denied here and not action. So, there may be action but it is as if there is none. Thus the dichotomization of the question of *jñāna*, *karma*, and *bhakti* in contemporary readings is a forced one. Failure to understand their unity and method arises from an incomplete realization of the implications of the fact that Indian philosophies do not separate the scientific or cognitive from the spiritual, nor do they separate theory from practice or means from ends. Furthermore, it may be argued that there exists

a unity of method amongst the different systems. They all attempt, with varying emphasis, a non-dualism which presupposes a necessary and systematic relation between *jñāna*, *karma*, and *bhakti*. It is significant that etymologically *bhakti* means “partaking,” referring to humanity’s share in Creation, through labor in production and reproduction. Thus humanity’s participation in this universe, in *jñāna*, *karma*, and *bhakti*, involves the principle of compassion for all creatures. One may note therefore that according to the *Nyāyasūtra*, compassion is a necessary requirement for the person who may bear witness—that is, for the speaker of truth (*āpta*). By inference, then, truth must itself be such that it embodies this principle of compassion. If the trinity of Brahmā, Viṣṇu, and Śiva represents the conditions for the possibility of the Unity translating itself into the plurality, *jñāna*, *karma*, and *bhakti* represent the means or conditions for the possibility of the realization of the Unity in the plurality by humankind.

TEXTS: ŚRUTI, SMṚTI, AND ITIHĀSA. Texts of the Vedic tradition are classified into three categories: (1) *śruti*, or revelation, comprising a compendium of hymns found in the four Vedas (*R̥k*, *Sāma*, *Yajur*, and *Atharva*), rituals in the Brāhmaṇas, and interpretations of vedic sacrifice in the Āraṇyakas, which include the Upaniṣads; (2) *smṛti*, meaning remembrance; and (3) *itihāsa*, meaning history or proof.

Etymologically, *śruti* refers to “that which is heard.” As has been said already, the orthodox systems of philosophy accept the authority of the Vedas, which are *śruti* texts. *Śruti* is eternal and impersonal (*apauruṣeya*). Some interpret *apauruṣeya* to mean nonhuman and infer a transcendental author of *śruti*. As the etymology of the term *śruti* suggests however, what is indicated is a “hearer” and not a transcendent speaker. Thus it is an eternal and universal revelation that may be heard by one who is chosen (or, that is, has the capacity to “hear”), and the ones who hear may speak in different tongues (*vāṇi*). Thus *śruti* and *vāṇi* make a pair, the one ineffective without the other. This is demonstrated by the fact that the Mīmāṃsaka, who believe in the eternalness of the Word, deny the possible contradiction to this assumption posed by the fact that a variety of sounds may associated with a single letter, by explaining that the modification of letter sounds is only in the hearing.

The philosophical systems and treatises in science, politics, medicine, art, architecture, and so on are classified as *smṛti*. *Smṛti* etymologically means remembrance (of *śruti*), and refers to the invocation of the name, which, as has been said, is the sign of the covenant between God, humankind, and nature. Thus *smṛti* in conjunction with *śruti* refers to the law that governs religion, politics, and science and identifies the law of God as the law of nature. Each discipline works out the laws in their specific determination in that specific science in such a way that the application of the law is at once the invocation of God/Unity by that specific name and the means to the realization of Unity through that calling and discipline. This presumes therefore the love of the All (cre-

ation) and makes necessary the principle of nonviolence in the constitution and application of all laws whether in science, religion, or politics.

Itihāsa, or “history,” includes the Purāṇas and the two great Indian epics, the *Rāmāyaṇa* and the *Mahābhārata*. They embody the dialogic and dramatic defense of and attack on the truth of the *śruti* and *smṛti* in the history and living experience of man in his relation to God, society, and nature.

EXPERIMENTS WITH TRUTH: RELIGION, PHILOSOPHY, AND CIVIL SOCIETY. This section will deal with Liṅgāyatism (Virasaivism), Sikhism, and Gandhism as examples of religio-philosophical schools that experiment with truth, and thus herald the modern period of Indian philosophy and history. Like Jainism, Buddhism, and Cārvāka philosophy, they also represent the vernacular tradition and the strength of civil society with regard to religion and the state. They critique Hindu dogma and ritualism, and its rigid and alienating social stratification. Without denying the essential truth of the Vedas, they emphasize the importance of experiment and of a living faith. Their example serves as proof of the existence of a principle of motion within Indian philosophy, society, and history.

It is not often noticed that the critique of *varṇāśramadharmā*, in whatever form, is accompanied by a realization of the necessary relation between the theory of the name and *bhakti*. This is significant because the social stratification along lines of *varṇa* was based on a division of labor and office. The theory of the name and *bhakti* together bring into focus the relation between vocation and invocation, labor and sacrifice, and service and office in the “partaking” of the creative and reproductive aspect of the universe. It may be said, then, that they announce for the modern age a theory and method of following one’s calling and conscience, which, while breaking away from medieval class hierarchy and rigidity, does not lapse into dichotomies of opportunism and idealism, or of individualism and communism.

Lingayatism was founded by Basava (also known as Basavaṇṇa or Basaveśwara) in South India in the twelfth century CE. It proposed a system of thought called Śakti-viśiṣṭādvaita, which argues that the principles of Unity (Śiva) and the potency (Śakti) to become plurality are inalienably and necessarily united in the *liṅga* (sign). The trinity that forms the conditions for the possibility of the transfiguration of the plurality through the realization of the Unity consists of *sthala* (substance/substratum), *liṅga* (sign/relation), and *aṅga* (part/attribute of the body of Śiva). *Liṅga* and *aṅga* are in a relation of complementarity and correspondence, as the object of service or worship is to the one who offers service or worship, as the macrocosm is to the microcosm, and as the whole is to the part. One may read Lingayatism as referring to a theory of signs and the trinity above as referring to the names of substance, relation, and attribute. Since the sign itself mediates between Unity and plurality, it refers to the category of relation.

The Vīraśaiva initiate wears a *liṅga* around his neck as a sign of being in a constant state of worship; the *aṅga* being incomplete without the *liṅga*, they are witness, each to the other. *Kāyaka*, the orderly conduct of life in this world, is itself “heaven” (*kailāsa*). The Liṅgāyat is at once householder and renouncer, as Śiva himself is. Thus the division of society into the monastic and householder’s way of life established by Jainism and Buddhism is overcome. The potency (Śakti) of the One (Śiva) has two modes—Śakti and *bhakti*. Though *bhakti* is a modification of Śakti, paradoxically it is the former that is considered superior since the latter is the impulse towards separation and plurality, veiling herself and her Lord, while *bhakti* is the impulse towards unity with the Lord. Men and women, high and low, all without exception have equal access to salvation in and through their respective vocation and station in society.

Sikhism carries further the experiment to bridge the dichotomy between religion and civil society and between the householder and the renouncer by taking into account their relation with a third category, the political, represented by the state. As J. P. S. Uberoi comments:

The new departure of Sikhism, in my structural interpretation, was that it set out to annihilate the categorical partitions, intellectual and social, of the medieval world. It rejected the opposition of the common citizen or householder versus the renouncer, and of the ruler versus these two, refusing to acknowledge them as separate and distinct modes of existence. It acknowledged the powers of the three spheres of *rājya*, *saṃnyās* [*saṃnyāsa*], and *gṛihasta* [*gṛhastha*], but sought to invest their virtues conjointly in a single body of faith and conduct, religion-in-society-and-history, inserted by grace and effort as mediation between heaven and the world, or the *ātma* and *Paramātma*, the individual and the All, as the modern Indian form of non-dualism of self, the world and the other. (1996, p.16)

Uberoi argues that the five, along with an unstated sixth, symbols of Sikhism—the *kēś* (unshorn hair) and *kaṅga* (comb) of Saṃnyāsa yoga, the uncircumcised state which is not stated but structurally indicated and the *kachh* (tailored loin garment) of *gṛhastha* yoga, and the *kirpan* (sword) and *kaṛa* (band of ritual constraint) of *rājya* yoga—signify the assumption of the offices of these three spheres, by an “ordered renunciation of renunciation,” and not as opposed to one another

The five symbols of Sikhism may be fruitfully compared with the eight *āvarṇas* (“sheaths”) of the Vīraśaiva, which form four pairs of symbols—*gurū* (example) and *liṅga* (sign of the unity of Śiva and Śakti), *jaṅgama* (the *jīvanamukta* “moving”/living in this world) and *vibhūti* (“ashes,” symbolizing renunciation), *rudrākṣa* (Śiva’s eye, indicating the status of being witness) and *pādodaka* (the water that has cleansed the feet of *gurū*, *liṅga*, and *jaṅgama*, indicating service), and *prasāda* (“grace”; the potency of that which we partake of through one’s vocation in the presence of the congregation) and *mantra* (invocation/potency of the name). These pairs

reflect the juxtaposition of form and name, being in the world and renunciation, through self-restraint and self-denial with respect to the world and the other, the inner and outer aspects of worship, and grace and potency in the world and the word respectively. Though it is perhaps right to argue that Vīraśaivism, unlike Sikhism, does not oppose religion and society to the state, the two traditions are nonetheless united in assigning primacy to the worship of the name, the life of renunciation in (and not “of”) this world, and worship through sacrifice and service.

With Sikhism is introduced the notion of the *samgha* (or congregation) as a society of the saved, membership of which is the condition for the reception of service and worship. This may be compared with Liṅgāyatism, which emphasizes the service and worship of the Ishtalinga (a personal deity) and the union of Śiva and Śakti symbolizing the possibility of creation, production, and reproduction of the species as the condition for the possibility of its reception. The notion of the congregation also plays a significant role in Gandhi’s philosophy.

The trinity that forms the foundation of Gandhian philosophy is comprised of truth, nonviolence, and experiment. Gandhi demonstrates through example and experiment that the study of the self cannot be separated from the study of the other and the world, in religion, politics, and science, and therefore that the truth of the one can not be independent of that of the other. According to him the adherence in spirit and practice to the principle of nonviolence, based on a love that embraces the meanest of God’s creatures, alone can be the method of investigation by which one may arrive at the truth. Thus he was as much against vivisection as a means of scientific study and progress as he was against the evil of untouchability as a social institution:

I abhor vivisection with my whole soul. I detest the unpardonable slaughter of innocent life in the name of science and society so-called, and all the scientists’ discoveries stained with innocent blood I count as of no consequence. If the circulation of blood theory could not have been discovered without vivisection then humankind could well have done without it. And I see the day clearly dawning when the honest scientist of the West will put limitations upon the present methods of pursuing knowledge. Future measurements will take note not only of the human family but of all that lives and even as we are slowly but surely discovering that it is an error to suppose that Hindus can thrive upon the degradation of a fifth of themselves or that people of the West can rise or live upon the exploitation and degradation of the Eastern and African nations, so shall we realize in the fullness of time, that our dominion over the lower order of creation is not for their slaughter, but for their benefit equally with ours. For I am as certain that they are endowed with a soul as that I am. (*Collected Works*, vol. 29, pp. 325–326)

Thus Gandhi presents a new theory of experiment as the discovery of nonviolent means of realizing truth in every aspect

of life with the self as the subject and the object of study in its relation of service to God, humankind and nature; it is new as much to the idea of the Indian tradition as it is to the modernity of the Enlightenment. Without deferring to either, it establishes the conditions for the possibility of true *swaraj* (*svarāj*) or self-rule of individual, society, and nation through labor, service, self-denial, and self-sacrifice in religion, politics, and science. The *satyāgrahi*, the nonviolent seeker after truth, equipped with fearlessness and a spirit of self-sacrifice, and invoking the name of God (*Rāmanāma*), is at once devotee, community/political worker, and scientist, combining service and experiment in faith, experiment and faith in service, and faith and service in experiment.

Denying that *varṇa* and *āśrama* had anything to do with caste, Gandhi drew attention to the fact that *varṇāśrama* asserts the law governing one’s being in society, refers to the calling by which we earn our bread, defines one’s duty not right, and emphasizes that all callings must necessarily be conducive to the welfare of all humanity. From this he concludes: “It follows that there is no calling too low and none too high. All are good, lawful and absolutely equal in status. The callings of a Brahmana—spiritual teacher—and a scavenger are equal, and their due performance carries equal merit before God and at one time seems to have carried identical reward before man” (1987, pp. 12–13).

According to Gandhi individual prayer is only a prelude to collective prayer and is ineffective without the latter. It is a necessary means to the realization of the brotherhood of man and the fatherhood of God, and to the realization of membership in society, and is necessary training for the use of the “weapon” of *satyāgraha* (“soul force”). Congregational prayer lays the foundation for the unity in plurality and the plurality in unity of religions, which is achieved through equality and difference, and complementarity and competition between them:

It becomes man to remember his Maker all the twenty-four hours. If that cannot be done we should at least congregate at prayer time to renew our covenant with God. Whether we are Hindus or Musalmans, Parsis, Christians or Sikhs, we all worship the same God. Congregational worship is a means for establishing the essential human unity through common worship. (1987, pp. 194–195)

CONCLUSION. The method of the non-dualism of *jñāna*, *karma*, and *bhakti*, in Indian philosophy, is based on a presupposition of the necessary relation between theory and practice, fact and value, means and ends, and the individual and the collective. This method therefore defines the nature and scope of both the dialectic within the scriptural traditions and between them and the vernacular traditions. The specific examples of issues and of religions discussed above demonstrate, albeit not exhaustively, the existence of a principle of motion within Indian philosophy that inspires the direction and development of its problematic in history and society.

In method, spirit, and project Indian philosophies present a species of modernity diametrically opposed to the modernity that derives from the European Enlightenment. The former presents a systematic working out of experiments to consider the necessary relation between religion, politics, and science in philosophy, history, and society, whereas, the project of the latter is to separate, systematically, their study in theory and practice.

- HISTORY OF STUDY

INDIAN RELIGIONS: AN OVERVIEW

The Indians, anthropologically a mixture of immigrant Aryans and partly autochthonous peoples, gradually elaborated a many-sided, highly developed culture rooted in the archaic structure of the human mind. This culture is characterized by an often almost complete integration of heterogeneous elements, by unity in diversity, by homogeneity despite the utmost variety and complexity of its ethnic and social composition, by a multitude of languages and different cultural

patterns, and by a great diversity in mental character and socio-religious customs, cults, beliefs, practices, and ways of life varying widely both regionally and, within the same region, from class to class. Indian culture gives free scope to the emotional and imaginative sides of human nature, to speculative, more or less visionary thinking and modes of apprehension, and it has long preserved the cohesion of its provinces: religion, art, literature, and social organization.

VEDISM. The religious life reflected in the oldest Indian literature in preclassic Sanskrit, the Veda (from about the thirteenth century BCE), is that of a predominantly ritual and sacrificial system (Vedism) developing, almost in seclusion, at first in the Punjab, later in the Ganges Plain, among the immigrant Aryans (Indo-Europeans), whose ideas and representations of the divine constitute an almost unified synthesis embodied in an elaborate mythology partly paralleled by ritual equivalences. Vedic thought was based on the belief in an inextricable coordination of nature, human society, ritual, and the sphere of myth and the divine; it was also founded on the belief that these spheres influence one another continuously and that men have, by means of ritual, an obligatory part to play in the maintenance of universal order and the furtherance of their common interests. In later times also, Indians have constantly sought correspondences between objects and phenomena belonging to distinct spheres of nature and conceptual systems. Many hymns and individual stanzas of the oldest literary corpus (the *Rgveda Saṃhitā*, an anthology drawn from family traditions) were intended for the cult and used in the liturgy of spectacular solemn (*śrauta*) ceremonies, which gradually increased in number, length, and complexity. These ceremonies were to ensure the orderly functioning of the world for the benefit of noble or wealthy patrons. The rites were performed in the open on a specially prepared plot—there were no temples or idols—by specialized officiants. Part of this literature was employed, along with texts from the *Atharvaveda Saṃhitā*, in the domestic or magic ritual performed by a householder or single priest to ensure an individual's health, safety, success, prosperity, and longevity. These texts and the ritual formulas of the *Yajurveda*, which invariably fulfill some ritual function, are collectively called *mantras*. They are believed to be revelations of aspects of the divine, the product of the exalted experiences of sages (*ṛṣis*) and hence constitute sacred and inherently powerful verbal formulas for producing a desired result. Some Vedic *mantras* remained in Hinduist rites, which, however, generally require other ones.

No definite chronology can be established for Vedic literature or the development of religious ideas and ritual practices. It is known that the collections of hymns were succeeded by the Brāhmaṇas, texts that discuss rites and rituals and explain their origin, meaning, and validity. These sacrificial acts, being the counterpart of the cosmic drama, are in fact also the symbolic expression of speculations about the origin and functioning of the universe and the significance, activity, and operation of the powers, personal and impersonal, presiding over its provinces and manifesting their presence and

influence. Thus the ceremonious construction of a special place for the ritual fire is believed to reintegrate the creator god, enabling him to continue his creative activity and to bring about a transformation and higher existence of the patron of the sacrifice, who in and through this ritual is identified with the creator and delivered from death. Mainly based on the Brāhmaṇas are the Śrauta-sūtras, manuals in which the rites are for practical purposes systematically and authoritatively described. No information is given on the earlier, prehistoric cult, which cannot be reconstructed. These works arrange the solemn rites in three classes: the partly inherited bloodless sacrifices, the more elaborate animal sacrifices, and the typically Indian soma ceremonies. In the course of time these elite *śrauta* rituals fell largely into disuse and were superseded by Hinduist rites performed at the expense of and for the benefit of much larger parts of the population.

HINDUISM. Some prehistoric forms of Hinduism—the civilization of the Hindus, consisting of their beliefs, practices, and socioreligious institutions—must have existed at the Vedic period, especially in the unrecorded religion of the lower classes, and probably earlier. Domestic ritual, which is entirely different from the solemn rites, consists of many rites that, though described and systematized by *brahman* authorities in the Vedic Grhyasūtras, are in essence not typically Vedic, or rather constitute Vedic varieties of widespread rites of passage, rites of appeasement, cult of the dead, and so on. Later chapters of this literature show markedly non-Vedic and post-Vedic influences, such as strong leanings toward Vaiṣṇava ritualism, which attest to the gradual incorporation of non-Vedic rites and substitution of extra-Vedic elements for those recognized by the original compilers of Hindu rites and practices. Gradually these elements became more prominent.

Non-Aryan influences. How much influence was exerted by the religions of the non-Aryan inhabitants of India on the formation and development of Hinduism is a matter of dispute. Although aborigines may have contributed some elements, their religion is generally different in many respects (e.g., they do not venerate the cow, and they allow their widows to remarry). The Vedic religion had no demonstrable relation with the great civilizations of Harappa, Mohenjodaro, and vast regions to the east of the Indus Valley (c. 2500–1500 BCE). As long as the graphic symbols on seals from these sites are not convincingly deciphered and the language is not identified (that it was Dravidian—the name of non-Aryan languages of southern India—is still unproved conjecture), most of the conclusions drawn from archaeological material and argumentation regarding links with elements or characteristics of older and even contemporary Hinduism remain as speculative as the hypothesis of a predominantly influential Dravidian substratum. Do the clay figurines of women really attest to some form of worship of a mother goddess that continued in the historical period, or to the existence of a prehistoric Śaiva *śakti* cult? Is the figure of a male dancer identical with the dancing Śiva? The wide distribution in various countries of, for instance, objects that

may have been amulets or votive offerings should prevent one from hastily regarding their occurrence in Hinduist religions as an uninterrupted continuance of a function supposedly attributed to certain Indus objects.

General characteristics. The main current of Hinduism, the so-called great tradition, is a remarkably continuous whole. The tendency to maintain continuity has always been deep-rooted but did not exclude the constant accretion and integration of further elements derived from non-Aryan peoples, extraneous sources (invaders on the northwestern frontier may have contributed to the custom of *satī*, the self-immolation practiced by widows, for example), and the activities of individual religious leaders. While continuity and change have been the prevailing patterns, incorporation and synthesis between the new and the traditional usually were more obvious than the often almost imperceptible elimination of those elements that no longer had a useful and recognizable function. Nevertheless, it is more common to draw upon the past than to invent anew, and apparently original ideas may be foreshadowed by concepts apparent centuries earlier. Thus many features of Hinduism have their roots in the Vedic past, and some characteristic ideas inherited from that past and developed in a few main currents—primarily doctrines of salvation—have up to the present largely determined the Indian view of life and the world.

The older Upaniṣads are the first recorded attempts at systematizing Indian philosophical thought. They are esoteric supplements to the Brāhmaṇas, intended for advanced pupils with a bent for reflection, abstract speculation, and philosophical discussion rather than ritual theory, and therefore answering the needs of ascetics and anchorites. Few Indians are inclined to reject the contents of these Upaniṣads, with which every subsequent philosophy had to show itself in accord. While emphasizing the philosophical value of the Vedic tradition, they are essentially concerned with describing the nature of what is alternately called *brahman* (the Absolute) or *ātman* (universal soul), and its relation with the individual soul (often called *jīva*). The realization of the identity of the latter with the former came to be substituted for the ritual method of conquering death and attaining integral life, the ultimate goal of all speculation. Being compilations, the Upaniṣads do not present a homogeneous philosophical theory, but there was a move to reconcile the references to the dualistic and evolutionistic doctrines of what was to become the influential Sāṃkhya school of philosophy with the prevailing monistic doctrines. Hinduism, directed by these works toward monism, has largely sought its inspiration in them.

There are a number of more or less constant elements of Hinduism. The central focus of India's spiritual life is the belief in and search for an uncreated eternal, fundamental principle (*brahman*), the ultimate source and goal of all existence. *Brahman* is the One that is the All and the sole reality, which transforms itself into the universe, or causes all existence and all beings to emanate from itself, and which is the

self (*ātman*) of all living beings. *Brahman* may also be conceived of as a personal “high god” (usually as Viṣṇu or Śiva), characterized by sublime and adorable qualities. Further elements are the confidence that one’s own existence and the culture of one’s community are founded on an eternal and infallible basis, and the craving for building one’s life and ideals on this firm foundation; the recognition of a pristine body of religious literature (the Veda) as an eternal and absolute authority considered to be *brahman* appearing as words, however unknown its contents; and acknowledgment of the spiritual supremacy by birth of the *brahmins*, another manifestation of *brahman*, who are regarded as representing the norm of ritual purity and who enjoy social prestige. The keystone of Hinduist ethics is the belief in the unity of all life and its corollary respect for life and fellow feeling with all living beings (*ahiṃsā*); the doctrine of transmigration and rebirth (*saṃsāra*, a post-Vedic term), first adumbrated in one of the oldest Upaniṣads (c. 600 BCE), and its complement, the belief in *karman* (previous acts) as the factor determining the condition into which a being is reborn, a consequence of a cyclic view of all worldly processes and existence. These doctrines encourage the opinion that mundane life is not true existence (the so-called Indian pessimism) and hence relate to the conviction that human endeavor should be directed toward final emancipation (*mokṣa*) from the mechanism of *karman* and transmigration, the only goal of this effort being the One (*brahman*) that is beyond all phenomenal existence. In view of the above, Hinduism exhibits a natural tendency to speculation hand in hand with religion as well as to a monistic philosophy and mysticism that has left intact traditional mythology and common beliefs. Finally, it is characterized by a complex polytheism subsumed in a fundamental monotheism and by a propensity to ascribe the attributes of other gods to the deity one is worshipping.

Early history. The history proper of Hinduism begins with the emergence of the great works on *dharma*, the totality of traditional custom and behavior that, agreeing with standards considered to derive their authority from the Vedas, manifests and maintains order and stability. This is also the age of the epics, especially the *Mahābhārata* (c. 300 BCE–300 CE), that “encyclopedia of Hinduism” that shows, even then, what appears to be a varied and confused conglomerate of beliefs and practices. However, there are two main currents, soteriologies when viewed from their doctrinal aspect and religions from the viewpoint of their adherents: Vaiṣṇavism and Śaivism. Neither current is in itself a unity. Yet all Vaiṣṇavas are essentially monotheistic, believing in Viṣṇu as their immanent high god (Īśvara), although in many contexts he appears as one of the divine polytheistic figures (*devas*). In the Vedas, Viṣṇu represents universal pervasiveness; his beneficent energy, in which all beings abide, reaches the world through the *axis mundi*, the central pillar of the universe. Vaiṣṇavas often worship him through his manifestations or incarnations (*avatāras*), such as Rāma or Kṛṣṇa. These and other originally independent figures had fused with Viṣṇu mainly as a result of the tendency to identi-

fy the various representatives of the Highest Person with the Primeval Person (Puruṣa), whose self-limitation, according to a Ṛgvedic hymn, inaugurated the era of creation. Preference for an *avatāra* is mainly traditional; in the North, Kṛṣṇa is more often worshiped; in the South, it is Rāma, Viṣṇu himself, or Viṣṇu’s consort, Śrī. In many myths the versatile Viṣṇu performs, often in well-known Indian places, great and miraculous deeds to confirm the *dharma*, protect humanity, and preserve the world. The *Bhagavadgītā*, an episode of the *Mahābhārata* and the most seminal of all Vaiṣṇava works, founded Vaiṣṇava ethics: Fulfilling their duties disinterestedly, humans should realize God’s presence in themselves, love him and their fellow beings devotedly, and dedicate all their actions to him so as to earn the prospect of final emancipation.

The Hinduist worship, in many different groups and currents, of Śiva in his various manifestations results from a complex development to which the often malevolent outsider god Rudra of the Vedas has contributed much. (There may also have been Dravidian influences.) Rudra, primarily representing the untamed aspects of uncultivated nature, was called Śiva (“the mild one”) when the benevolent and auspicious aspects of his nature were emphasized. Śaivism is an unsystematic amalgam of pan-Indian Śaiva philosophy, local or folk religion, mythological thought, and popular imagery. Śiva’s many-sided character, to which accreted features of great gods as well as demoniac powers, is split up into many partial manifestations representing aspects of his ambivalent nature. As Īśvara he is the unique and almighty Supreme Person, representing an abstract, sole principle above change and variation, less human than Viṣṇu, and much less active, although elsewhere, in his role as Nāṭarāja the dancer, he originates the eternal rhythm of the universe. He is both mild and terrible, a creator and destroyer, an ascetic and a sexualist. Thus Śiva represents a composite god who is a unity to his devotees, and he plays many apparently contradictory roles in myths, which, on various levels, resolve logically irreconcilable contradictions.

BUDDHISM AND JAINISM. The same period saw the spread of two heterodox soteriologies, heterodox because they reject the authority of the Veda and the social prejudices of the *brahmins*, although they scarcely attack the fundamentals of Hindu belief and practices. The way in which the early Buddhists presented their doctrines has much in common with the oldest Upaniṣads, which must antedate the spread of the Aryan culture to the south and the activity of Gautama (c. 560–480 BCE). Gautama, the Buddha, first gave an exposition of his basic doctrine in Banaras. He taught that those who wish to be delivered from *saṃsāra* and the automatism of *karman*, which does not rely upon a permanent transmigrating soul (whose existence the Buddha denied), should realize four basic truths: (1) earthly existence is pain; (2) the cause of pain is craving for existence, leading to rebirth; (3) cessation of that craving is cessation of pain; (4) an eightfold path leads to that cessation. Final deliverance is realized only in an ascetic and monastic life by those who, after having suc-

cessfully observed definite rules of life and reached complete meditation (*samādhi*), experience the undefinable state of *nirvāna*, the cessation of all becoming. The daily activities of Buddhist monks were recitation, meditation, instruction, and collecting alms from the laity (who largely continued adhering to Hindu belief and observing Hindu practices). As the number of adherents increased, the Buddhist order received large gifts that led to the establishment of monasteries. The multiplying order spread to different parts of India, including the south and Sri Lanka (third century BCE). In the beginning of the fourth century BCE the community began to be split by successive schisms, each of which made its own collection of canonical texts. After about 500 CE, Indian Buddhism began to decline.

The Buddha was not the only illuminated teacher who, after renouncing the world, organized his initiates into a community. In Bihar one of his contemporaries, Vardhamāna Mahāvīra, reformed an existing community and founded the predominantly monastic Jainism, which spread to northern and central India, Gujarat, and the Deccan, and in the last few centuries BCE split into two groups, not on philosophic disagreement but on points of rules for the monks. Jainism is systematic and has never changed in its basic ideology. Its philosophy is dualistic: It posits nonliving entities (including space and time) pervaded by (partly transmigrating, partly emancipated) immaterial and eternal souls; the world, eternal and changeless, is not governed by a supreme being; the system is characterized by the absence of gods (*devas*); *karman* is the central power that determines the destiny of unemancipated souls. Humans have to perfect their souls and those of their fellow creatures; *ahiṃsā* and universal tolerance are the main duties and cardinal virtues. Whereas the adherents of Buddhism were from a variety of social classes, Jainism attracted the wealthy and influential. The Jains erected beautiful temples with statues of their perfect souls (*siddhas*) and produced an enormous body of moral and narrative literature. Nowadays they often tend to return to Hinduism, against whose social order they have never revolted.

HINDUISM AFTER ABOUT 300 BCE. When Buddhism and Jainism enjoyed royal protection, they could extend their influence. However, the masses doubtless always remained Hinduist, even under the Maurya dynasty (c. 326–c. 187 BCE), from which time the epigraphical records left by kings create the impression of a Buddhist supremacy, and in the first and second centuries of the common era, when foreign rulers accorded Buddhists protection. Until the fourth century, inscriptional and numismatic evidence of Vaiṣṇavism and Śaivism is scanty, but the period of the Gupta dynasty (320–c. 500 CE), which patronized the *brahmins* and the Hinduist communities, saw the full development of classical Sanskrit and the rise of a non-Buddhist architectural style. The construction of a temple, a rite based on mythical reality, a sacrifice leading to a higher level of self-realization for the builder, is, like the construction of the great Vedic sacrificial fire-place (usually, though inaccurately, called “fire

altar”), always the material expression of the doctrine of reintegration. At the temple the god is worshiped through his image (*mūrti*), whose beauty contributes to its force as a sacred instrument. In elaborate ceremonies the god, as an exalted personage and royal guest, is offered food, flowers, and incense. His iconography, consecration (introduction of the god’s spirit), and installation, as well as the *mantras* used, the significance of the material and requisites, and the spirit animating the execution of temple and images, are all meticulously described. This daily worship (*pūjā*) probably continues many non-Aryan elements that were gradually received by the higher classes and incorporated into the Brahmanical literature. *Pūjā* is also performed at home by the household. As far as the uncomplicated older private cult survived, it was supplemented by the traditional (*smārta*) cults of Viṣṇu, Śiva, and other gods, morning and evening rites, oblations in the consecrated fire, recitation, and mental adoration.

During many centuries after about 300 CE there arose an enormous body of mainly Vaiṣṇava and Śaiva literature. The Puraṇas, stemming from various circles and regions, but significantly all attributed to the redactor of the Vedas and the *Mahābhārata* and claiming to be inspired, deal with cosmogony, cosmology (the universe exists cyclically, its eternal return implying the eternal return of souls to bondage and suffering), mythology and legends, principles and philosophy, religious practices and ceremonies, local cults and sanctuaries, sacred rivers and places of pilgrimage. The many, still-influential Āgamas, also in Sanskrit, mainly teach the practical realization of religious truths, while largely governing temple and household ritual and the traditional religious life and behavior of Hindus. Their subject matter is theoretically divisible into four categories: higher knowledge, which gives access to final emancipation; physical, mental, and psychic concentration, that is, complete control of all corporeal and mental functions, leading to the same goal (*yoga*); meritorious works; and rites, including the many socially and religiously important festivals that are believed to stimulate and resuscitate the vital powers of nature. The Āgamas favor various philosophical doctrines. A feature of the Vaiṣṇavāgamas, usually called *Samhitās*, is *bhakti*, “participation (of the soul in the divine),” devout and emotional worship and adoration of a personal deity in a spirit of deep affection, amounting to surrender to God. Because these works also teach non-Vedic tenets, they are often considered heterodox, in that they deviate from the Hindu *dharma*. Some religions, such as the northern Śaiva Pāśupatas, have propagated consciously divergent rites and practices. Most Vaiṣṇavas, among them the Pāñcarātras, however, deny that they deviate from the generally accepted tradition; many southern Śaivas regard their Āgamas (although with no certain proof) as the Sanskritization of an originally Dravidian tradition; some assume the influence of oral esoteric doctrines. In fact, numerous elements are, notwithstanding argumentation to the contrary, non-Brahmanical in origin.

ŚAIVA RELIGIONS AND TANTRISM. Some religions of India do deviate from common Hinduist traditions and institutions. In contrast to the Śaiva Siddhāntins of the Tamil-speaking South—who, basing themselves also on the mysticism of the Śaiva Tamil saint-poets (Nāyanārs), teach that God in the shape of a spiritual guide, or *guru*, graciously permits himself to be realized by the purified soul—the Vīraśaivas, or Līngāyats, in southwestern India (not mentioned before the twelfth century) abandon many traditional elements (e.g., caste, image worship). Doctrinal dissent is always possible. The religio-philosophic idealist and monist Kashmir school of Śaivism disagrees in certain important respects with the teaching of Śaṅkara (eighth century), the founder of Advaita monism, derived from the Upaniṣadic Vedānta as a system of absolute idealism that is mainly followed by the intellectual elite. Śaṅkara, a native of Malabar who resided in Banaras and traveled throughout India, was a superb organizer; he established a monastic order and monasteries (*maṭhas*), which, like the many hermitages (*āśramas*) and the great shrines, became centers of religious activity and contributed to the realization of his ideal of Hindu unity.

From about 500 CE, Tantric ritual and doctrines manifest themselves more or less frequently in Buddhism, Śaiva Siddhānta, and Pāñcarātra. Tantrism, primarily meant for esoteric circles, yet still an important aspect of Hinduism, is a systematic quest for spiritual excellence or emancipation through realization of the highest principle, the bipolar, bisexual deity, in one's own body. The possibilities of this microcosmos should be activated, sublimated, and made to exert influence on the macrocosmos, with which it is closely connected (physiological processes are thus described with cosmological terminology). Means to this end, partly magical, partly orgiastic, include recitation of *mantras*, contemplation of geometrical cosmic symbols (*maṇḍalas*), leading the performer of the rites to the reintegration of consciousness; appropriate gestures (*mudrās*), and meditation. Tantric *pūjā* is complicated and in many respects differs from conventional ceremonies. Especially in Bengal, Tantrism has tended to merge with the Śākta cult. The term *Tantra* commonly applies to Śaiva or Śākta works of the Tantric tradition. Śāktism, not always clearly distinguishable from Śaivism, is the worship of the Supreme as divine creative energy (*śakti*), a female force that creates, regulates, and destroys the cosmos; when regarded as a person, she usually is Śiva's spouse, often the dreadful goddess Durgā or Kālī. In contrast to the so-called right-hand Tantrists, who emphasize yoga and *bhakti*, the left-hand Tantrists seek to realize the union of the male and female principles in the One by combining control of the senses with the sexual act; in addition, they make sacramental use of what is forbidden (e.g., meat) to the *brahmans*.

VAIṢṆAVA RELIGIONS AND BHAKTI. Although Vaiṣṇavism, less coherent than Śaivism, had, in the sixth century, spread all over India, it reached predominance in Tamil Nadu, which became the cradle of important schools and move-

ments that still have many adherents. The tradition known as the Śrī Vaiṣṇavas was inaugurated between about 900 and 1130 by Yāmuna, the first apologist of Vaiṣṇava theology, and consolidated by the great philosopher Rāmānuja (c. 1017–1137). The Śrī Vaiṣṇavas introduced into their temple ceremonies the recitation of Tamil hymns of the Ālvārs, which evince a passionate belief in and love of God. Considering these poets and their great teachers (*ācāryas*) integral parts (*aṃśas*) of God's nature, they often worship images of them in their temples. According to Rāmānuja, *brahman* is as a "person" (*puruṣa*) the sole cause of his own modifications (emanation, existence, and absorption of the universe), immaterial, perfect, omnipotent, the soul of all being, the ultimate goal of all religious effort, to which God induces the devotee who wishes to please him. The purificatory significance of the ritual, meritorious works, disinterested discharge of duties, and *bhakti* are emphasized.

The influential *Bhāgavata Purāna* (c. 900?), also composed in Tamil Nadu, teaches that God through his incomprehensible creative ability (*māyā*) expands himself into the universe, which is his outward appearance. On the basis of this teaching, Bengal Vaiṣṇavism developed the theory of a relation of inconceivable difference in identity and identity in difference between God and the world, as well as the belief that God's creative activity is his sport (*līlā*). The emotional and erotic description of young Kṛṣṇa's sport with the milkmaids (*gopīs*), who represent souls pervaded by *bhakti* who yearn for God, enjoys lasting popularity. In this Purāna, *bhakti* religiosity was expanded, deepened, and stimulated by singing, meditation, and looking at Kṛṣṇa's image. As the safest way to God, *bhakti*, a mystical attitude of mind involving an intuitive, immediate apprehension and loving contemplation of God, often overshadows the devotee's aspirations to final emancipation and assumes a character of uncontrollable enthusiasm and ecstasy, marked by tears, hysteria, and fainting.

In northern and central India the *bhakti* movement flourished from the thirteenth to the eighteenth century, producing a vast and varied literature in vernacular languages. Even today these areas feel the influence of a long succession of saint-poets, passionate itinerant preachers (among them Caitanya, in Bengal, 1485–1533), and *gurus*. These mystics and religious (rather than social) reformers propagated public singing of their devotional songs and *kīrtana* (the praise of God's name and glory), and preached a nonextremist way of life. While so addressing the masses, *bhakti* influenced almost all religious communities and contributed as a unifying force considerably to a revival of Hinduism.

REACTION TO FOREIGN RELIGIONS. The revival of Hinduism in the south and the spread of the *bhakti* movement also prepared the Indians to withstand the proselytizing of external religions, particularly Islam. From 1000 CE onward, the Muslims conquered the Northwest, made Delhi their capital, and extended their influence to Bengal, the Deccan, and the

South, destroying temples and idols and making many converts, particularly among the untouchables. But Islam scarcely affected the Hindu way of life; rather, it provoked a counterreaction in the form of increased adherence to the Hindu *dharma* and the Hindu religions and stricter observance of rites and ceremonies. Nevertheless, the presence of Islam in India involved an age-long conflict between strict monotheism and the various manifestations of Hinduism. In one field, however, Islam and Hinduism could draw near to each other: Muslim and Hindu mystics have in common the idea of an all-embracing unity. To be sure, the Šūfīs made this idea a channel of Islamization, but some Indian spiritual leaders tried to bridge the gulf between Islam and Hinduism. Kabīr (c. 1450–1525), an itinerant ascetic, mystic, and strictly monotheist poet and eclectic teacher and preacher, rejected traditional ritual and Brahmanical speculation but retained the belief in basic concepts such as *karman* and *samsāra*. In the course of time his syncretistic religion became largely Hinduized. Nānak (1469–1539) was likewise a strict monotheist who stated that any pluralistic and anthropomorphic idea of the Supreme should dissolve in God's only form, the really existent. An opponent of caste and idolatry, he organized his followers, the Sikhs, in an exclusive community, an amalgam of Islam and Hinduism, which gradually was transformed into an armed brotherhood hostile to Islam but separated from the Hindus. Supreme authority resides in their holy scripture (*Granth*), the reading of which is their main form of worship.

India's contact with the West, Christianity, and modern life since the early nineteenth century has led to the emergence of many new religious movements and spiritual groups, as diverse in their principles, ideals, and reactions to foreign influences as the personalities of their founders; most distinguish themselves from traditional devotional movements by a more pronounced interest in ethical, social, and national issues. The extent of their influence in India has, however, often been exaggerated in the West, for the beliefs and customs of the Indian masses are still largely traditional.

The first product of this cultural encounter, the Brāhmo Samāj, a partly social, partly religious organization, was founded by the Bengali *brahman* Ram Mohan Roy (1772–1833), who, using modern vehicles of propaganda such as the press, advocated social reform and a reformation of Hinduism, which, if purged of abuses and with its monotheistic features underscored, might become the foundation of a universal religion. Schisms resulting mainly from the activities of the *bhakti* mystic Keshab Chandra Sen (1838–1884) led to the coexistence of various small groups of differing aims and ideals. In the second half of the nineteenth century, anti-Muslim and anti-Western ideas as well as religious nationalism led to movements of reformation and modernization or to the propagation of what was considered the essence of traditional Hinduism. One such reformation movement representing the former tendency is the Ārya Samāj, founded in 1875 by Dayananda Sarasvati (1824–1883). Sarasvati advo-

cated absolute adherence to the religion of the Vedic hymns, which he regarded as a continually misinterpreted source of pure monotheism, moral and social reform, and guidance toward the right way to salvation; however, most of the doctrines Sarasvati accepted (e.g., *karman*) were post-Vedic. Opposed to foreign religions, the Ārya Samāj propagates a refined nationalist and democratic Hinduism without symbols and local cults but including the worship of God with praise, prayer, meditation, and daily ceremonies. The main object of Ramakrishna (1836–1886), perhaps the best-known modern Hindu saint, was the propagation of the Vedānta as a superior and comprehensive view of life that synthesizes all faiths on a higher level of spiritual consciousness. A devotee of Rāma and later of Kṛṣṇa, he practiced the Vaiṣṇava form of love; convinced that Hinduism, Islam, and Christianity all lead to the same God, he also adopted Christian methods. Under his disciple Vivekananda (1862–1902), who turned the trend of Vedānta philosophy toward new values, the Ramakrishna Mission (founded 1897) became, in India, an important force for spiritual regeneration and unification.

INDIAN RELIGIONS: RURAL TRADITIONS

The religious beliefs and practices of rural India reflect the influence of three general cultural traditions that throughout history have mingled and mixed in varying degrees. Grouped generally, these traditions are those of agricultural cultures, food-gathering communities, and nomadic societies.

Since the third millennium BCE the most stable groups within these three traditions have been those of the agricultural cultures, which are typified by their development of written script and by their emergent sophistication in the production of artifacts reflecting a pervasive consciousness of the earth and its vegetation. The myth-bound lives of people in these cultures have long been linked to the cycles of time experienced in the circular movement of the seasons and in the resulting change in the earth's character. The fundamental energy that gave life to sprouting seeds was commonly understood to be feminine and was represented in female im-

ages—although a variety of icons, figurines, and magical geometric drawings painted on home floors and walls also reveal a pervasive worship of the sun, water, grain, and other natural phenomena. Possessed of an archaic knowledge of tools and agricultural methods, these people were India's first inventors and creators and have given as their cultural inheritance to India agrarian technologies that until recently remained unchanged for five thousand years.

A second general cultural stream arose from the archaic food-gatherers living in India's forests and mountain regions and whose myths reflect the notion that they are the firstborn of the earth. Made up mostly of tribal societies with a remote past and no recorded history, these groups established kingdoms and ruled large areas of the vast interior of India, but then disappeared again into the wilderness, where they lived in caves, hunted animals, and collected wild foodstuffs from the dark and pathless forests. These peoples, too, experienced life as power and developed magical and sacerdotal means by which they could please or combat the intensely felt but unseen and terrible potencies of the natural world. Like the ancient agriculturalists, they also felt kinship with the earth but in their case revered the animals and wild plants of the forest rather than of the domestic arena. They, too, knew the earth intimately and understood her to whisper her secrets to them as long as they did not wound her breasts with the plough.

The third cultural stream was comprised of nomadic peoples, wanderers across the lands who have bequeathed to their descendants a racial memory of ancient migrations across wild deserts, over rugged mountains, and through lush valleys. These were cattle herders and horse riders who first entered India, the land of rivers, seeking water for their stock. They had a penetrating visual vocabulary based on an astute appreciation of color and light. Their rituals and art forms share in this vibrant experience of the world. Their bards and dancers were vigorous drinkers who lived a free and spontaneous life full of the passion of war and love.

India's rural religious traditions arose from the confluence of these three cultural streams. These ancient societies are the predecessors of the rural people today whose farming techniques, arts, and rituals give form to primordial tribal myths. When women today paint ceremonial drawings, when artisans create fecundative images, when singers and performers tell of epic conquests, they concretize the legends and mysteries of these ancient groups. From this archaic unconscious come rural myths of cosmic power, of cyclical destruction and creation, of natural processes in which human beings live their lives.

Women of today's higher castes in northern Mithila recount a myth that is identical both in form and meaning to a legend sung by autochthonous women of the deep south who worship the goddess Pedammā. The long history of the myth indicates a substratum of powerful and energetic female memories, the unconscious source of which is transmitted through feminine culture and given form in the act of communication between mother and daughter. In this myth

are to be found remnants of ancient wisdom regarding creative power that carries the germ of its own destruction. Out of this tradition arises values that are deeply understood by the women of Mithila, who say with great simplicity that “these insights come from a time without beginning; we carry this wisdom in our wombs.”

Candrakālā Devī, a traditional artist of Mithila, narrates the following myth:

First there was Ādi Śakti (“primordial power”), another name for whom was Mahāmāyā (“great creator”). She was the one, alone. She desired [a partner] and, displaying her *māyā*, created the manifest world out of the void. A cosmic egg appeared and the new male gods Brahmā, Viṣṇu, and Śiva emerged when it hatched. As these gods grew to young manhood, Ādi Śakti turned with fiery passion to Brahmā and sought to marry him. Brahmā recoiled, saying, “You are our mother!” The goddess laughed at him and reduced him to ashes. The same thing happened to Viṣṇu: He, too, retreated, filled with horror and he, too, was consumed by fire. The luminous goddess then approached Śiva, the young, beautiful, long-limbed youth who, hearing her demands, smiled and accepted her as his bride.

The story’s versions as told in the South and the North are the same to this point. But now they diverge. In the legend as told in Mithila (in the North), Śiva responds to the goddess Ādi Śakti by asking her to accept him as her disciple. She agrees to his request, and Śiva learns from her the secrets of life and various incantations for raising the dead. Having mastered these mysteries and ancient secrets of power, Śiva then destroys the primordial Ādi Śakti by engulfing her with flame and reducing her to ashes, promising to her as he does so that he will marry her again after many aeons when she is reborn as Satī, the daughter of Dakṣa. The story acknowledges that this second marriage did, indeed, eventually take place.

The Dravidian variant—one in which passionate youth is said to lead irrevocably to old age and decrepitude—is darker and more archaic. As in the northern version, Śiva agrees to marry Ādi Śakti after the goddess has reduced Brahmā and Viṣṇu to ashes for refusing to do so. In the southern account Śiva is then said to ask Ādi Śakti if he may have as a gift from her the brilliant jewel that shines as brightly as ten thousand suns and that rests on her forehead. Infatuated, she agrees to the request and hands the jewel to her young lover. As he takes it from her hand the goddess ages frightfully, as if centuries had just elapsed in the moment’s duration. Formerly a beautiful goddess who lived unhindered by time, she is now suddenly a bent and undesirable old woman. Time, the devourer of all things, has entered the world. Śiva merely smiles; for he is Kālā, the lord of time. With this action, the new gods have taken over. The primordial primacy of female power is reduced to ashes, its brilliance usurped. The female takes second place in the Puranic pantheon to the male.

Candrakālā Devī molds images of Ādi Śakti out of clay and paper pulp to which has been added *methi* (cumin seed), ground to a paste. The image of the goddess has many arms, an elongated body, and hollow eyes. She is reminiscent of the ancient and universal Mātālas, the earth mothers. Their gaunt, passionless, masklike faces have crater-deep eyes, stark with the secrets of death and life.

Images of Ādi Śakti, the primeval mother, are made at harvest time. Also known as Aṣṭabhuja (“eight armed”), she holds in her hands the cosmic egg as well as a cup that holds the seed or blood to fertilize the fields; she also holds the sun and moon, the earth (depicted as a flat plate and covered with grass and sprouts of other plants), two bullocks pulling a plow, a plowshare, a flower, and a sword.

By the beginning of the second millennium (no one knows exactly how early), groups of peoples migrated into India from the Northwest. They were not of one tribe, nor had they all reached the same levels of cultural development or of artistic abilities. The best-known of these migrating groups were the Vedic Aryans. Strong, heroic, and proud of their identity, these people had wandered the steppes for generations, never settling long enough to establish any cities.

The Vedic Aryans were warriors who brought with them into the river valleys of northern India the songs and poems that came to be included in the *mantras* (hymns) of the Vedic religious textual tradition. Their songs were robust, loud, and full of life: hymns to the awesome processes of nature; invocations to Aditya, the sun god; praises to Vāyu, the wind, and to Uṣas, the maiden of the dawn. Moving into the decaying or destroyed Harappan urban areas, the Vedic Aryans introduced to those agricultural peoples the instruments of war, new dimensions of language, new volumes of sound, new relationships with nature, and pulsing vitality.

In successive waves through the centuries the Vedic Aryans moved on their horse-driven chariots along the densely forested banks of the Indus, Ganges, and Yamunā rivers. It took a thousand years for them to reach the Narmada River in central India (in modern Madhya Pradesh), by which time they had merged into the cultures of the vast hinterland through intermarriage and by adopting local customs, skills, and tools.

It is likely that the Vedic Aryans found the original inhabitants of India living at various levels of technological culture, those groups living within the walled cities of Mohenjodaro and Harappa contrasting vividly with the Paleolithic societies living in the dense forests along the banks of the Ganges or in the caves of the Vindhya Mountains. Five-thousand-year-old ruins scattered throughout the Harappan sites indicate that the people of the Indus Valley had established a highly developed society: They had discovered the wheel, with which they transformed their methods of transportation and increased the sophistication with which they molded their clay pots; they had developed simple tools with which they could measure angles and with which they could

build structures with precision and accuracy; they had learned to grow and spin cotton, to weave and dye cloth, to mold clay, and to cast bronze into figurines.

Intense intellectual and psychological activity accompanied the tremendous revolution in technology and the production of tools brought about by these early city dwellers. They had developed a script to illumine their pictographs, and they practiced yoga and other meditative techniques to expand their minds.

With the fall of the cities to natural and martial forces, large numbers of people took refuge in the wilds of central India, traveling all the way to the banks of the Narmada and Tapti rivers and even farther south. They carried with them into the inner lands of the subcontinent their knowledge of agriculture, technology, ritual, and magic. The influence of these urban skills and perceptions appear in their symbols, worship, and magical practices.

The migrations of nomadic peoples onto the fertile plains of India were to continue through the centuries. One of the most important of these tribes to the development of Indian culture and its rural traditions were the Ahirs, who came to be known in the epic *Mahābhārata* as the “snake-loving” Abhiras.

The figure of Kṛṣṇa also was known as Māyōṇ or Māyavan in ancient Tamil *samgam* literature; the dark-skinned, non-Aryan god emerged in the culture of Mathurā and reflects a mixture of elements from Ahir and tribal backgrounds. The name itself, *Kṛṣṇa* (“dark one”), is pregnant with early Aryan scorn; but it was Kṛṣṇa who was to supply the generative vitality that transformed Indian arts and culture.

Stories about the personalities and affairs of Kṛṣṇa, of the Goddess, and of other local heroes were collected by the compilers of the epic poems the *Mahābhārata* and the *Rāmāyaṇa*. These tales, as well as myths and legends recounted in the various Purāṇas, traveled by word of mouth through the vast lands of India. Transmission of these stories was enhanced by their widespread multifaceted use of song, dance, mime, drama, and iconography. These various media allowed all kinds of people, particularly members of those tribal groups living outside the mainstream of society, to experience the sensory nature of the divine presence and to express the immediacy of that presence through an active, personal, and contemporaneous participation.

Rural painters and balladeers drew their inspiration and source material from Ahir love songs, accounts of brave and victorious heroes, and tales of the Puranic gods and their erotic adventures. The most famous of these ballads was the *Lorikagan*, which was composed in Avadhi (a dialect of Hindi) and which recounts the love held by Lorik, an Ahir from the Mithila country, for Chaṇḍa, the wife of Śrīdhara. According to the tale, Śrīdhara had become impotent as a result of a curse placed on him by the goddess Pārvatī. Chaṇḍa then fell in love and eloped with Lorik. Śrīdhara

searched for the couple, only to be killed by Lorik when he found them. The young couple then approached the master gambler Mahāpatra Dusadh and engaged him in a game of dice. Lorik lost Chaṇḍa and all his wealth to Mahāpatra Dusadh. But Chaṇḍa argued with Dusadh that the stakes involved in the game did not include her clothing and demanded that the gambling continue. On resumption of the game she sat down in front of Dusadh and exposed her beautiful body. Intoxicated by the sight of Chaṇḍa’s nakedness, Dusadh lost control of the game and was defeated by Lorik, who later killed him. This legend finds expression in paintings, theater, and song.

The tribal kings of central India also had an ancient bardic tradition. The Gond *rājās* included in their courts official tribal genealogists and musicians known as Pardhans, who recounted to the royal household the ancient stories of the Gond hero-kings and warriors. Serving also as priests and diviners, in time the Pardhans absorbed Hindu legends, gods, and even ethics into their tribal epics, ballads, and other expressions of folklore.

A Pardhan today worships his musical instrument, the *bana*, as the god Bara Pen. “As his sacred books [are] to a Brahmin, as his scales [are] to a Bania, as his plough [is] to a Gond, so is the bana to the Pardhan” (Hivale, 1946, p. 66).

It is said that the original Pardhan was timid when he first played his wonderful new music in the house of the Gond brothers. But he played so divinely that all those residing in the heavenly as well as earthly worlds were enchanted. Even the supreme god, Nāyāyaṇ Deo, stood watching in amazement. Then the Pardhan forgot his shyness and completely lost himself in his music. He danced ecstatically with his *bana*, with which he produced sounds the world had never heard before. On that day, it is said, three new *par*s (sounds or combination of sounds) known as Sarsetī Par, Nāyāyaṇ Par, and Pujan Par were first created.

Pābujī is a folk hero who is especially popular among the Bhils, a tribal group living in Rajasthan. According to legend, Pābujī was suckled as an infant by a lioness and grew to be a brave warrior. He was given a powerful black mare named Kālīmī by Deval, a *cāraṇ* woman of a pastoral community. In return for this gift Pābujī promised to protect Deval’s life and cattle, and he eventually died in the attempt to keep his promise. Among the Bhils are a group of bardic musicians (*bhopās*) who travel through the countryside with a fifteen-foot long painted scroll known as the Pābujī-ka-Pad (Pābujī’s scroll). In its center lies the main figure, a portrait of Pābujī himself, painted in vibrant red, black, olive, and yellow ocher. Surrounding this main figure are depictions of warriors engaged in battle, images of horses, lions, and tigers, and scenes of heroic incidents that serve to illustrate the legend of Pābujī. Performers reenact stories based on that legend at night. The scroll is stretched out, oil lamps are lit, and the *bhopā* sings his story. As he sings, a woman lifts the lamp to the cloth in order to illumine for the crowd the figures

of warriors on horseback, animals, birds, and other elements of the tales. She joins with the *bhopā* in singing the refrain and, at times, dances.

The bards of the Santāls in Bengal and Bihar are known as *jādu paṭuā* (“magic-painters”), who carry from village to village their painted *paṭ*s depicting scenes from the Purāṇas as well as their own tribal cosmogonic and anthropogonic myths.

The fundamental assumptions of male supremacy in Brahmanic culture were established by the time of the classical law books such as the *Manusmṛti* (c. 200 BCE–100 CE) and the various Dharmaśāstras. According to these and other texts, a girl was dependent on her father and then, as a woman, was inferior to her husbands and sons. Such ideals of Indian womanhood as obedience and faithfulness to the male were embodied in the images of the goddesses Sītā and Savitrī.

Vedic learning was closed to women by the time of the *smṛti* (“remembered”) literatures. However, in the vast and flat countryside that encircled the cities and in the rural life of the village and fields surged a powerful, flexible, ancient, and secret undercurrent among women, wandering yogins, Tantric adepts, and magician-priests, who focused their religious sensibilities on the primeval female, Śakti, and on Śiva, the mysterious god of the autochthonous tribes.

The earliest, almost primordial, images of the earth mother glorified a feminine creative principle made manifest by the image itself, which often celebrated the secrets of birth and death. The dark earth-bound goddess was a mother, yet a virgin, for “no father seemed necessary to the society in which she originated” (Kosambi, 1962, p. 90). Originally represented aniconically through hieroglyphs and vegetation symbols, through the centuries the primeval mother came to be represented in animal and finally in anthropomorphic images of Śakti, who had a thousand names and forms. Potent with the energy of life itself, and holding within herself the essence of her earlier incarnations, she had the capacity to heal and transform. Such earlier forms find expression in the hieroglyphic triangle resting on her heart or generative organs. Her vegetal nature appeared in the plants she held in her hands. Her animal incarnations were transformed into the various beasts on which she rode. As the primary physical and spiritual essence of the universe, Śakti was alive in the experience of color, form, taste, and fragrance. In her final form she was Durgā—the holder of all life, brighter than a thousand suns.

Tantric texts describe Durgā’s symbols: “The Goddess of renowned form assumes in times of protection the form of a straight line. In times of dissolution, she takes the form of a circle. Similarly for creation she takes the brilliant appearance of a triangle” (Sastry, 1906, p. 280).

A new priesthood and new relationships with the gods became inevitable with the rise of the male godhead into the Puranic pantheon. The emergent potent male deity was

known as the *kṣetrapal* (guardian of the field and womb), Thakur Dev. The *kṣetrapal* protected and fecundated the earth and field, the body of the goddess. In the religious rites the people expressed their search for cosmic transformation, embodied in the act of sexual union between the God and Goddess. Agricultural magic fused with alchemical and Tantric practices.

Either the aboriginal magician-priest known as the *baiga* or a priest from the potter, the barber, or the *camār* community presided at ceremonies worshiping trees and river-washed stones held at the village or forest shrines honoring the primeval mother, the Goddess, various deities, or the tribal hero. The potency of his magic was recognized and accepted by the villagers and householders living in the sheltered rural societies. The Tantric doctrines outlined in the Āgama and Nigama textual traditions, the frenzied ecstatic worship of Śakti through ritual performance and *mantra*-recitation, had pervaded the Indian psyche to the depths of the cultural subconscious. In prosperous villages the Puranic gods were worshiped; but along with this praise, and at a deeper level, a worship of the pre-Vedic deities continued and the practice of Tantric rituals remained.

One of the attributes of the Goddess was *jāgaritṛ* (wakefulness). Through practicing such *vrata* (“vow”) rites as fasting, meditative concentration, and other observances, the woman votary directly invoked the power of the goddess by awakening her power (*śakti*) inherent in various symbols, stones, trees, and water pots. She drew geometric shapes (*maṇḍalas*) on the ground and on the wall of houses, worshiped the interlocking triangle known as the *yantra* dedicated to the Goddess, and performed in the darkness various rituals accompanying the sprouting of corn. Songs, dance, and image-making flourished as part of the ceremonies. The worshiper hoped through creative expression, *vrata*, and ritual song and dance to awaken Śakti and to ensure that, once awakened, that primal energy was not dissipated or dispersed.

Unlike the temporary clay images of the *grāma mātṛkās* (“village mothers”), which have mysterious links with the earth and its cyclical patterns of creation and destruction, the images of the *vīras* (deified “heroes”) and the *kṣetrapals* are shafts embodying virility and power carved in stone and wood. Rising as pillars to the sky and toward the sun and yet rooted in the earth, the harsh simplicity of the flat visual planes thus gives to the images a heroic dimension representing the sanctity of the immovable and the eternal divine presence.

The term *vīra* (“hero”) is often used to refer to the valiant ancestors killed in battle while protecting women, fields, and cattle. It also is used to describe the alchemists, yogins, magicians, and enlightened ones who gained control over and conquered the ways of their bodies and minds. Both types of *vīras* were deified and worshiped in the form of the *vīrakāl* and *pālīā* stones. The *vīra* cult itself is an ancient one that centers on an admixture of ancestor worship, vener-

ation of the heroic protectors and guardians as well as of magicians and seers, and praise of such figures as the Hurā Purā (deified heroes) or the Āyi Vaḍil (deified ancestors) of the Bhil tribes. The cult also includes the worship of a wonderfully rich symbolic complex associated with the *yakṣas*, spirits of the forests and rivers known by the compilers of the *Atharvaveda* and the Purāṇas. Depicted as having tall male bodies (which they are mysteriously able to transform), the *yakṣas* were regarded at first as malevolent beings, but underwent a significant change at some point when they became associated and identified with the *kṣetrapaks* and the *vīrās*, with whom they protected and watched over the welfare of the earth and the Goddess.

India's most powerful symbol of the hero is a rider on a horse. Carved in memorial stones or cast in metal icons and amulets, the image displays the vitality and energy of the heroic male.

Elements of the *vīra* cult evolved through time into the worship of Śiva, the supreme god of rural India. Śiva is described as late as the third century CE as a *yakṣa* who is to be propitiated in the wild regions beyond the village walls. Rural customs still exist in India that reflect Śiva's autochthonous origins. In the Punjab and in Himachal Pradesh, for example, women are not permitted the worship of Śiva. Women in Uttar Pradesh can worship Śiva in the form of the *liṅga*, but they must carry their offerings to the god in the corner of their *sārīs* and must never allow their hand to touch the phallic form as they circumambulate it.

The tribal Bhils worship Śiva as their first ancestor. The Gonds of Bastar sing an epic, Lingo pen, in which they describe the appearance of Śiva in human form:

There the God Mahādev was ruling from the upper sea to the lower sea. What was Mahādev doing? He was swimming like a rolling stone, he had no hands, no feet. He remained like the trunk [of a tree]. Then Mahādev performed austerities for twelve months. And Bhagavān [i.e., Śiva] came and stood close to Mahādev and called to him. "Thy devotion is finished, emerge out of the water." He said, "How shall I emerge? I have no hands, no feet, no eyes." Then Mahādev received man's form. Thus man's form complete was made in the luminous world. (Hislop, 1866, pp. 2–3)

Next to their drawings of the corn goddess the Warlis of Maharashtra often display an image known as Pāñc Siryā Dev, a headless male figure with five sheaves of sprouting corn emerging from his body. Among the Bhils of Gujarat a five-headed figure with an erect penis is cast in metal and is called Pāñc Mukhi Dev. Both images are linked to Śiva and to cultic fertility rites.

In some regions of West Bengal the roles and personalities of Śiva and the sun god fuse into the worship of Dharmā Thākur. The *maṇḍala* (village headman) performs rituals centered on the marriage of Śiva and Gaurī at which Kalighat painters used to congregate in order to sell their paintings to pilgrims.

At the Nilā Gajan or Gambhira festivals Śiva is worshiped as Nilākaṅṭha (*nilā* is an indigo cloth worn by low-caste devotees of Śiva who worship the planets and for whom the Gambhira is a key harvest ritual). Singing abounds in these rites. One song describes Śiva as a cultivator of cotton and as one who loves Koch tribal girls:

The month of Baisakh came,
The farmer ploughed the field;
The month of Āṣāḍh came,
God Śiva planted cotton seeds,
As the planting was over,
Śiva went to the quarter of the Koch women.
He stayed and stayed on there,
Until he knew that cotton had grown.
Śiva returned to gather cotton,
He placed the stuff in the hands of Gaṅgā,
She spun yarn out of it.
Śiva wove a piece of cloth,
The washerwoman Netā washed it clean,
She washed it by water from the ocean of milk.
(Bhattacharya, 1977, pp. 60–61)

Having become the central deity in rural areas, Śiva then became the figure from which all of the minor rural gods emerged. The elephant-headed Gaṇeśa ("lord of the folk"), for example, is regarded as the son of Śiva, though no legend specifically relates the nature of his birth. Originally worshiped as a malevolent spirit and the creator of obstacles, Gaṇeśa underwent a transformation during the time of the composition of the Purāṇas and assumed the role of protector of the people and the remover of obstacles. Hanumān (or Māruti), the devotee of Rāma, is also known to be an incarnation of Mahābhairav, who, in turn, is one of Śiva's many manifestations. No forest or village masculine deity is free of an intimate association with Śiva, the central personality of the cosmos and locus of the processes of creation and destruction.

Deep within the religious practices and ideologies of rural India lie the recognition of cosmic transformation marked by the flexive flow of creation and destruction, the appreciation of the vital forces of life, and the longing to be protected from the powers of the physical and spiritual worlds. The gods fuse and merge, or they are transformed, or they vanish with the receding forests and disappearing tribes. New gods come into being and new rituals emerge, bringing with them changes in the form and content of religious expressions. But the sacredness and the mystical power of rural religious sensibilities survive the many changes in deities and rituals throughout history.

Revised Bibliography

INDIAN RELIGIONS: MYTHIC THEMES

India, like other civilizations, has myths that deal with themes shared by all human beings—the great themes of life and death, of this world and the world beyond—which she inflects with her own personal colorations and thus makes different from the myths of other civilizations. Moreover, Indians have been inspired to create myths on themes that have not appealed to other civilizations with the same intensity,

or on themes that simply do not exist outside of India. One can go further in laying out this spectrum of the general and the particular, beginning with the universals and moving through large shared cultures (such as the Indo-European) down through India as a whole until one reaches the many particular, local traditions within India. This approach views myths on the analogy of languages (as F. Max Müller taught), which can be broken down into language families (again, the Indo-European), languages, dialects, and regional dialects. Indeed, if one wishes, one can go still further, until one reaches, in India, at least a single language (or dialect) that is said to be spoken by a single person. So, too, at the end of the line (and perhaps at the beginning of the line too, *in illo tempore*), each myth exists in a unique version in the mind of the individual who knows it.

In attempting to present an overview of Indian mythic themes, the author of this article has chosen to begin with the great universal themes as they appear in their Indian incarnations (primarily Hindu forms, though with some passing references to the Buddhist variants of the pan-Indian themes) and to move through the narrower Indo-European functions of the myths in India to variants that are uniquely Indian. There the article shall perforce stop; it would be impossible to trace the regional subvariations in an essay of limited size and wide range, and of course the subvariations in the minds of all the individual myth-knowers are infinite. But it must never be forgotten that these subvariations do exist (and have been recorded in some of the books listed in the bibliography attached to this article) and that, moreover, they flow not only downstream (from the pan-Indian to the local) but upstream, from the local to the pan-Indian, in a cybernetic process that lends the great myths much of their particular flavor, texture, and vivid detail.

ANIMALS. Although it is no longer believed, as it once was, that all mythology is somehow connected with totemism, it is certainly still true that you cannot have a mythology without animals. Animals and gods are the two communities poised on the frontiers of the human community, the two “others” by which humans define themselves. And though all animals can be mythical, certain animals tend to be more mythical than others, more archetypal, if the reader will. Birds and snakes recur throughout the mythologies of the world, both individually and as a matched pair. Individually, birds (and eggs) are symbols of creation; their wings make them part of the kingdom of heaven, where they come to function as symbols of God (in Christianity) or of the magic woman from the other world (the swan-maiden of European folklore). Snakes slough their skin to become symbols of rebirth, or bite their tails to become symbols of infinity (the Uroboros); they bring about the loss of innocence (as in the *Book of Genesis*) or the loss of immortality (as in the *Epic of Gilgamesh*). Together, birds and snakes symbolize the elements of air and subterranean water, spirit and matter, good and evil, or simply the principle of opposition, through the observed natural enmity of the two species.

All of this symbolism is found in Indian mythology, together with more narrowly Indo-European themes: the killing of the dragon-serpent (Indra killing Vṛtra, Kṛṣṇa subduing Kāliya); the battle between birds and snakes (the quarrel between Vinatā, the mother of snakes, and Suparṇā, the mother of birds, in the opening books of the *Mahābhārata*). Also found in the *Mahābhārata* are traces of the more subtle Indo-European theme of the battle between the snake and the horse (of which is found echoes in paintings of Saint George, always mounted on his white horse, killing the dragon): In the course of the quarrel between Vinatā and Suparṇā, the black snakes form the hairs of the tail of the sacred horse, a trick that leads eventually to a great sacrifice in which snakes are killed in place of the usual stallion. But as might be expected in a country as snaky as India, snake symbolism is more luxuriant than it is elsewhere. The *nāgas*, half serpent, half deity, who inhabit the waters of the lower world, participate in many myths and adorn most temples; Viṣṇu sleeps on Ananta, the serpent of eternity, and Śiva wears snakes for his bracelets, his necklaces, his sacred thread, and (with occasionally embarrassing results) his belt. Birds of a rich mythological plumage are equally pervasive; Viṣṇu rides on the *garuḍa* bird (a descendant of the Vedic sunbird), Skanda on a peacock (an appropriate emblem for the general of the army of the gods), and Brahmā on a royal goose or swan (the *haṃsa* that is also a symbol of the transmigrating soul).

Another important Indo-European pair of animals, the horse and the cow, remain essential to the mythology of the Vedas and to that of later Hinduism. The stallion loses in India some of his ancient power as a symbol of royal, martial, and fertile functions (the Indo-European triad), although he remains an important figure on the local, village level, where one still encounters many minor horse deities and equine heroes, as well as charming terra-cotta horses, some of enormous size. The mare became in India a symbol of the voracious female who must be tamed (like the submarine fire in the form of a mare held in check by the waters of the ocean, until the moment when she will emerge at doomsday to destroy the universe). But the animal who truly usurped the stallion's place of honor is the cow, which became symbolic of all the values of the society of the newly settled Ganges Valley (in contrast with the nomadic, warring Indo-European society that was so well symbolized by the stallion); the cow represented motherhood, nourishment, chastity, and noninjury (the cow being an animal able to furnish food without having to be slaughtered). The bull plays a relatively minor role, primarily as Nandi, the vehicle of Śiva.

A more purely Indian symbol is the elephant, representing royalty, power, wisdom, fertility, longevity, and much else. The mother of the future Buddha dreamed, upon conceiving him, that a white elephant had entered her womb; Lakṣmī, the goddess of good fortune, is lustrated by two elephants; elephants support the earth and the quarters of the sky; the god Gaṇeśa, patron of scribes and of all enterprises,

has the head of an elephant, the source of his cunning and of his ability to remove obstacles. At the other end of the Indian animal spectrum is the dog, already maligned in Indo-European mythology (Kerberos, the dog of Hades, appears in the *Rgveda* as the two Sārameyas, the four-eyed brindled dogs of Yama, the king of the dead). In India, the dog became a vehicle for all the negative values of the caste system; he was regarded as unclean, promiscuous both in his eating habits and in his (or, more often, her) sexual habits; dogs are said to be the food of untouchables (who are called "dog-cookers," *śvapakas*, in Sanskrit). Yet Yudhiṣṭhira, the righteous king in the *Mahābhārata*, refused to enter heaven until the gods allowed to enter with him the dog that had followed him faithfully through all his trials, a dog who turned out to be none other than the god Dharma himself, incarnate.

In addition to these individual animals, Indian mythology teems with animals of a more miscellaneous sort. Every Indian god has an animal for its vehicle (*vāhana*). This association means not only that the god is literally carried about on such an animal (for the elephant-headed Gaṇeśa is awkwardly mounted on a bandicoot, or large rat) but also (and more importantly) that the animal "carries" the god in the way that a breeze "carries" perfume, that the god is always present in that animal, in all of its manifestations (the bandicoot, for example, shares Gaṇeśa's nimbleness of wit and ability to get past anything, and so is indeed an appropriate vehicle for the god). This is the only sense in which animals (including cows) are sacred in India; the tendency not to kill them (which does not, unfortunately, generally extend to a tendency not to ill-treat them) arises from something else, from the concept of noninjury (*ahiṃsā*) that discourages the taking of any life in any form. In addition to these official vehicles, many gods appear in theriomorphic or semitheriomorphic forms; Viṣṇu becomes incarnate as the man-lion Narasiṃha, but he also is often represented with the head of a boar and the body of a man in his *avatāra* as the boar. When Śiva makes war on Viṣṇu the boar, he takes the form of a *śarabha*, a beast with eight legs, eight tusks, a mane, and a long tail.

More generally, whether or not people get the gods they deserve, they tend to get the gods that their animals deserve; the natural fauna of any country has a lot to do with the ways in which the people of that country perceive their gods. For example, two animals that play an important role in Indian mythology are the monkey and the tiger. Although neither of these animals is the vehicle of a god, the monkey is a cousin of Hanuman, the monkey ally of Rāma, the divine hero of the *Rāmāyaṇa*, and the tiger sometimes replaces the lion as the vehicle of the goddess Devī (especially in places where lions have long been extinct). But the influence of monkeys and tigers extends far beyond their recorded roles in the mythology. The ingenious mischievousness of the monkey and the uncanny cruelty and beauty of the tiger are qualities that have found their way into the images of many Hindu gods and goddesses. If Judaism has a mythology of lions, and

Christianity a mythology of sheep, India has a mythology of monkeys and tigers.

THE TREE AND THE MOUNTAIN AT THE CENTER OF THE EARTH. Many, if not all, of the mythologies of the world have located a tree or a mountain, or both, at the center of the world. In India, the sacred mountain is Mount Meru, the golden mountain, wider at its peak than at its base. The sacred tree, too, is inverted, the banyan with its roots in the air. The particularly Indian variants of this myth begin in the *R̥gveda*, where the sacred *soma* plant, which bestows immortality on the gods, functions as the *axis mundi*, or cosmic pillar, in propping apart heaven and earth. The same *soma* plant is said to have been stolen from heaven by Indra, mounted on an eagle, who carried the plant down to the mountains of earth. This is the Indian variant of the Indo-European myth of the theft of fire; Prometheus carried fire down to earth in a hollow fennel stalk, while Indra (who also embodies the lightning bolt) carries the fiery liquid of *soma* in its own hollow stalk. The association of the mountain, the sacred plant, and the theft continued to produce offshoots in later Hindu mythology. In the *Rāmāyaṇa*, Hanuman is sent to fetch a magic plant that will revive the fallen hero; he flies to the magic mountain and, unable to decide which plant it is that he wants, uproots the entire mountain and brings it to the battlefield. Elsewhere in the *Rāmāyaṇa*, and in the *Mahābhārata*, the gods and demons join forces to use the sacred mountain Mandara as a churn with which they churn the waters of the ocean to obtain the *soma*. As soon as they get it, the demons steal the *soma* from the gods, and the gods steal it back again.

Snakes are also associated with the mountain and the magic plant (as is the serpent in Eden) and with the cosmic waters: When the serpent Vṛtra has wrapped himself around a mountain, holding back the waters (which are homologous both with the *soma* juice that Indra loves and with the rains that he controls), Indra pierces him so that the waters flow again; it is a snake, Vasuki, who is used as the rope for the churn when the gods and demons churn the ocean for *soma*; and when Viṣṇu sleeps on the serpent of eternity in the midst of the cosmic ocean, a lotus plant grows up out of his navel—the navel of the universe. This web of associations forms the framework for the many local myths about particular trees (banyan trees, coconut palms, the sacred mango tree in the temples of South India) and particular plants sacred to particular gods (the *tulsi* of Viṣṇu, the *rudrākṣas* of Śiva).

COSMOGONY, THEOGONY, AND ANTHROPOGONY. Most Indian mythologies seem to agree about the way in which the universe is arranged: It has a sacred mountain in the center, and concentric oceans and continents around the center; the sacred mountain connects the earth with heaven above and the underworld below. This is the basic Indian cosmology. But there are many different explanations of how the universe came to be the way that it is; these are the Indian cosmogonies. The earliest source, the *R̥gveda*, refers glancingly to many different theories of creation. Sometimes the world

is seen as the result (often apparently a mere by-product) of a cosmic battle, such as the victory of Indra over Vṛtra, or as the consequence of the seemingly unmotivated act of separating heaven and earth, an act that is attributed to several different gods. These aspects of creation are woven in and out of the hymns in the older parts of the *R̥gveda* (books 2–9). But in the later, tenth book one encounters for the first time hymns that are entirely devoted to speculations on the origins of the cosmos. Some of these hymns seek the origins of the existence of existence itself, or of the creator himself, the golden womb or golden embryo (later to become the golden egg or the golden seed of fire in the cosmic waters). Other hymns speculate upon the sacrifice as the origin of the earth and the people in it, or upon the origins of the sacrifice itself. Sacrifice is central to many concepts of creation, particularly to those explicitly linked to the sacrificial gods or even sacred speech itself, but it also appears as a supplement to other forms of creation, such as sculpture or the spreading out of dirt upon the surface of the waters.

In more anthropomorphic conceptions, creation takes place through a primeval act of incest. In the Brāhmaṇas, the incestuous father is identified as Prajāpati, the lord of creatures; his seed, cast into the fire in place of the usual oblation of clarified butter or *soma* juice, was distributed into various life-forms, ritually creating the living world. Later Indian cosmogonies in the epics and Purāṇas continue to combine the abstract with the anthropomorphic. Sometimes the universe is said to arise out of the waters of chaos, from a flame of desire or loneliness that expresses itself in the creation of living forms as well as such abstract entities as the year, logic, grammar, and the thirty-six musical scales. Sometimes a single god (Brahmā, the creator, or Śiva or Viṣṇu, according to the sectarian bias of the text, or even an undifferentiated sort of Vedantic godhead) arises out of the primeval waters and begins to create, more precisely to emit, the world from within himself; this emission (*prasarga*) is the act of projecting his mind onto formless chaos to give it the form that is its substance. In this latter case, the god usually continues to create by taking the form of an androgyne or by producing a woman out of his own body. From there creation proceeds through anthropomorphic methods, often by a combination of sexual intercourse and the generating of ascetic heat, or *tapas*.

The link between abstract cosmogony and highly inflected anthropogony is made explicit in the Purāṇas, which are traditionally expected to deal with five basic topics: the primary creation (of the universe) and the secondary creation (of gods and humans and all the other living creatures); the dynasties of the sun and of the moon (that trace their lineage back to those divine celestial bodies and forward to the rulers at the time of the recension of the text that contains the list); and the ages of the Manus or ancestors of humans, generally said to be fourteen (the present time is the seventh Manus age). A different sort of cosmogony-cum-anthropogony begins back in the *R̥gveda*. This is the Indo-European theme

of the dismemberment of a cosmic giant or primeval man (Puruṣa), a theme that also appears, outside of India, as the dismemberment of the primeval androgyne. In the *R̥gveda*, this man is the victim in a sacrifice that he himself performs; the moon is born from his mind, the sun from his eye, the gods from his mouth, and so forth. Moreover, from this dismemberment there arise the four classes, or *varṇas*, of ancient Indian society: the *brahmins* from his head, the rulers and warriors from his chest, the workers from his arms, and the servants from his feet. The Indian text thus extends the three original Indo-European functions that Georges Dumézil taught researchers to recognize (priest-kings, warriors, and producers of fertility) by adding a fourth class that is “outside” the original three, for these three alone receive the epithet “twice-born” (that is, reborn at the time of initiation) throughout Indian social history.

But the myth of the dismembered man says little about theogony, and the *R̥gveda* contains no systematic narration of the birth of the gods as a whole, although the births of various gods are described in some detail: Indra, kept against his will inside his mother’s womb for many years, bursts forth out of her side and kills his own father; Agni, the god of fire, is born of the waters; and so forth. One important late hymn does speak of the birth of the gods in general, from a female called Aditi (Infinity), who is more particularly the mother of the sun and who remains the mother of the solar gods or *adityas* (who are contrasted with the *daityas*, or demons, the sons of Diti) throughout later Indian mythology.

In the epics and Purāṇas, the creation of the gods (and, in turn, of humankind and the animals) is usually attributed to whichever god is regarded by the text in question as the supreme god; thus the Vedic tendency to worship several different gods, but to regard the god one is addressing at the moment as God (a kind of theological serial monogamy that F. Max Müller dubbed henotheism or kathenotheism, “one god at a time”) continues into post-Vedic theogonies and anthropogonies.

ESCHATOLOGY AND DEATH. At the end of each aeon comes doomsday, or *pralaya*, when the universe is destroyed by a combination of fire and flood until at last the primeval waters of chaos close back over the ashes of the triple world. In anthropomorphic terms, this is regarded as the moment when God, whose waking moments or whose dream has been the source of the “emission” of the universe from his mind, falls into a deep, dreamless sleep inside the cosmic waters. And at the end of that sleep, at the end of the period of quiescence, the universe, and the consciousness of the god, is reborn once more out of the waters of chaos.

Thus, eschatology is necessarily the flip side of cosmogony; the wave set in motion by the act of creation is already destined to end in a certain kind of dissolution. The particular Indian twist on the Indo-European model, which added a fourth class to the original three in the anthropogony, places its stamp on the Indo-European eschatology, with its twilight of the gods. First of all, India developed, like Greece,

a theory of four ages of declining goodness; where the Greeks named these ages after metals, the Indians called them after throws of the dice, the first and best being the *kr̥ta-yuga*, which is followed by the *tratā*, the *dvāpara*, and finally the present age, or *kaliyuga* (the equivalent of snake-eyes in dice). The choice of the metaphor of dice, with its implication of a fortuitous, impersonal controlling mechanism (which is, moreover, a negative one—the house always wins), is not itself fortuitous; it expresses a basic Indian belief in the inevitable loss of goodness and happiness through the fault of no conscious agent, but just “through the effects of time.” The Indian version of the loss of Eden (which appears in Buddhist and Jain as well as Hindu texts) further emphasizes a change in quality between the first three ages and the fourth: The first three are the mythic ages, while the last is real, happening now. And the “end” that comes after the fourth age is not the end at all; the linear decline is combined with the circular pattern of cosmogony and eschatology that has already been seen, and the end becomes the beginning. Time spirals back in on itself like a Möbius strip.

This eternal circularity of time is further developed in India within the context of the unique Indian mythology of *karman*, according to which there is a substance that is intrinsic to all action (*karman*, from the Sanskrit verb *kr̥*, cognate with the Latin *creo*, “to do, to make”) and that adheres to the transmigrating soul throughout its life and across the barrier of death, determining the nature of the next rebirth. There are many assumptions embedded in this theory: that there is a transmigrating soul; that one’s positive and negative actions are tallied up and carried across the bottom of the ledger page at the end of each life. But the mythology of *karman* reveals a hidden ambivalence in the values expressed by the theory of *karman*. That is, in many myths of *karman*, people want to go on being reborn, in better and better conditions of life, and ultimately in the heaven of the gods. These are the myths within the Vedic and Puranic corpus that exalt *pravṛtti*, or active involvement in worldly life (*saṃsāra*). But there are many other myths in which people want to escape from the wheel of rebirth, to cease from all activity (*nivṛtti*), to find release (*mokṣa*); these are myths influenced by Vedānta and by Buddhism and Jainism. In this latter view, the universal eschatology is replaced by the individual eschatology (or soteriology), the ultimate dissolution of the individual soul (*ātman*) in its final release from the universe itself.

A parallel development took place in the mythology of death. In the *R̥gveda*, death is vaguely and uneasily alluded to as the transition to a place of light where the ancestors live, a place ruled by Yama, the primeval twin and the first mortal to die. Much of the subsequent mythology of the Brāhmaṇas is an attempt first to explain the origin of death and then to devise means by which death may be overcome, so that the sacrificer will be guaranteed immortality. The Upaniṣads then begin to speak of the terrors of re-death, and to begin to devise ways of obtaining not immortality but release from

life altogether, *mokṣa*. And in medieval Hinduism, *bhakti*, or the passionate and reciprocated devotion to a sectarian deity (Śiva, Viṣṇu, or the Goddess), was thought to procure for the worshiper a kind of combination of the Vedic heaven and the Vedantic release: release from this universe into an infinite heaven of bliss in the presence of the loving god. In this way, the mythology of *bhakti* resolved the conflict between the Vedic desire for eternal life and the Vedantic desire to be free of life forever.

HOUSEHOLDER AND RENOUNCER, DHARMA AND MOKṢA. A similarly irreconcilable conflict of values is addressed in the Hindu mythology of the householder and the ascetic. Again, one can, if one wishes, see this simply as the Indian version of the widespread theme of the conflict between involvement in the world and a commitment to otherworldly, spiritual values, the conflict between God and mammon. But one can still view the development of this theme within the particular context of Indian intellectual history, more particularly as another instance of the pattern that adds a (transcendental) Indian fourth to an older, Indo-European societal triad. Originally, there were three stages of life, or *āśramas*, in ancient India: student, householder, and forest dweller. That this was in fact the original triad is substantiated by the three “debts” that all Hindus owe: study (the first stage), the debt owed to the Vedic seers, or *ṛṣis*; the oblation (performed by all married householders) to the ancestors; and sacrifice (offered by the semirenunciatory forest dweller) to the gods. And there were three goals of life: (*puruṣārthas*): success (*artha*), social righteousness (*dharma*), and pleasure (*kāma*). At the time of the Upaniṣads and the rise of Buddhism, Jainism, and other cults of meditation and renunciation, a fourth stage of life was added, that of the renouncer (*saṃnyāsīn*), and a fourth goal, *mokṣa*. Although these fourth elements were basically and essentially incompatible with the preceding triads, revolutionary negations of all that they stood for, the dauntless eclecticism of Hinduism cheerfully embraced them as supplements or complementary alternatives to the other three. (Similarly, the *Atharvaveda*, a text wholly incommensurate to the other three Vedas in style and purport, was tacked on as the fourth Veda during roughly the same period.) This conjunction of opposites inspired many ingenious responses in the mythology. In some myths, the covert, ancient, anti-ascetic bias of worldly Hinduism was expressed through tales of hypocritical, lecherous, and generally carnal renouncers; in others, the self-deceptive aspirations of otherworldly householders were dashed or ridiculed. In yet others, the uneasy compromise of the forest dweller—half householder, half renouncer, and the worst half of both—was exposed as a double failure; the myths in which Śiva mocks the sanctimonious sages of the Pine Forest and their sex-starved wives, or the myths in which the impotent and jealous sage Jamadagni curses his lubricious wife, Renukā, are important examples of this genre.

The mythology of renunciation, particularly as it interacted with the mythology of the ancient, nonrenunciatory orthodox caste system, gave rise to an important cycle of

myths about kings and untouchables. Even in the Vedic period, the ritual of royal consecration included a phase in which the king had to experience symbolically a kind of reversal, renunciation, or exile before he could take full command of his kingdom. In the later mythology of the epics, this theme is crucial: Both the heroes of the *Mahābhārata* and Rāma in the *Rāmāyaṇa* are forced to dwell in exile for many years before returning to rule their kingdoms. In several of the early forms of this myth, the period of exile is spent in association with untouchables; thus Hariścandra, Viśvāmitra, and other great kings are “cursed” to live as untouchables among untouchables before being restored to their rightful kingship. In terms of world (or at least Indo-European) mythology, one can see this theme as the Indian variant of the motif of the true king who is kidnapped or concealed for his own protection at the time of his birth (the slaughter of the innocents) and raised among peasants before returning to claim his throne. This theme is well known through such figures as Moses, Jesus, Oedipus, Romulus, or even Odysseus, and, in India, Kṛṣṇa. But the particularly Indian aspect of this theme emerges from two special applications of the phenomenon of renunciation or exile.

First, this experience happens not only to kings but also to *brahmins*, many of whom are cursed or otherwise condemned to live as untouchables for a period before they are ultimately restored to their brahmanhood. This adventure is neither politically necessary nor psychosexually expedient (in the Freudian mode); it is simply an aspect of the initiation into suffering and otherness that is essential for the fully realized human being in Indian myths. For the king, at the top of the political scale, the experience among the untouchables is a descent from power to impotence; for the *brahman*, at the top of the religious scale, it is a descent from purity to defilement. The experience of impotence is regarded as just as essential for the wise execution of power as the experience of defilement is essential for the dispassionate achievement of purity.

Second, the Indian development of the myth of renunciation and exile does not always end with the resumption of political power. The most famous example of this alternative denouement is the myth of Gautama, the Buddha Śākyamuni, who dwelt among the Others not by actually leaving his palace to live as an untouchable but by seeing and empathizing with the quintessential “other” from the standpoint of a young king who had been sheltered from every form of weakness or sadness: the vision of an old man, a sick man, a dead man, and a renouncer. As a result of this vision, the Buddha left his palace, never to return again. This myth served as a paradigm not only for many Buddhist (and Buddhist-influenced) myths of renunciatory kings but also for many local, sectarian myths about saints and the founders of heterodox traditions, who left the comfort of orthodoxy to dwell among the Others—not necessarily true untouchables, but non-*brahmins*, even women, people who did not know Sanskrit and had no right to sacrifice—and who never returned.

A final cycle within the corpus of myths of renunciation is the series of myths in which “good” demons “renounce” the canons of demonality in order to become ascetics or devotees of the sectarian gods. The myth of the demon Prāhlada, who loved Viṣṇu and was saved from the attacks of his truly demonic father by Viṣṇu in the form of the man-lion, is the most famous example of this genre. One could view these myths as covert attacks on the threat posed by the ideal of asceticism to the worldly basis of conventional Hinduism: Anyone who strove for renunciation, instead of remaining within the bourgeois, sacrificial Hindu fold, was “demonic.” To this extent, the myths of good demons can with profit be related to other, non-Indian myths about conscientious devils and saintly witches, myths in which religious innovators or inspired misfits are consigned by the religious establishment to the ranks of the ungodly. But, as always, the Indian variant is peculiarly Indian; here, these myths become myths about caste, and although there are many systems that may resemble caste, there is nothing outside India that duplicates the caste system.

The myths of the good demon are myths in which the overarching, absolute, pan-Indian values of universal *dharma* (*sanātana dharma*, which includes truthfulness, generosity, and noninjury) are pitted against the specific, relative, mutually contradictory, and localized values of “one’s own *dharma*” (*svadharmā*), which is peculiar to each caste. Thus, some castes may be enjoined to kill animals, to kill people in battle, to execute criminals, to carry night soil, or even to rob. As the *Bhagavadgītā* relates, it is better to do one’s own duty well (even if it violates absolute *dharma*) than to do someone else’s duty (even if it does not violate absolute *dharma*). The good demon—good in relativistic, demonic terms—would be good at killing and raping, not good at telling the truth. Thus, in the mythology of orthodox Hinduism, the gods send Viṣṇu in the form of the Buddha to corrupt the “good” demons, to persuade them (wrongly) to give up Vedic sacrifices in favor of noninjury and Buddhist meditation. Stripped of their armor of absolute goodness, the demons are destroyed by the gods, while the demons who remain safely within the fold of their relative goodness survive to contribute their necessary leaven of evil to the balance of the universe. In the later mythology of *bhakti*, however, which successfully challenged caste relativism, the “good” demons are not destroyed; on the contrary, they are translated out of the world entirely, forever absolved of the necessity of performing their despicable duties (despicable in absolute terms), to dwell forever with the God for whom caste has no meaning.

These myths may also express the conflict between life-affirming Vedic values (which, traditionally, have included killing one’s enemies in battle as well as killing sacrificial animals) and life-renouncing Vedantic values (of which *ahimsā*, the ideal of noninjury, is the most famous if not the most important). They may also be viewed as conflicts between contradictory cosmogonies. The traditional Hindu universe, or “world egg,” was closed; those who died must be reborn

in order to allow life to recirculate; those who were virtuous had to be balanced by others who were evil in a world of limited good. This reciprocity was further facilitated by the *karman* theory, which held that one’s accrued good and bad *karman* could be transferred, particularly through exchanges of food or sexual contact, from one person to another; if one gained, the other lost. Thus, if there are to be saints, there must be sinners. Nor may the sinners refuse to sin, or the demon to rape and pillage, if the saint is to be able to bless and meditate. (Or, in another part of the forest, the householder must not refuse to sacrifice and produce food if the renouncer is to be able to remain aloof from sacrifice and yet to go on eating.) Yet the renouncer wished, ideally, to leave this universe altogether; the good demon wished to abandon demondom forever. The *bhakti* mythology of good demons was thus inspired to create a series of liminal heavens in which the devotee, or *bhakta*, demonic or human, could satisfy the absolute demands of universal *dharma* while disqualifying himself from, rather than defying or explicitly renouncing, the demonic demands of his own *svadharmā*.

GODS VERSUS DEMONS. But it is a mistake to view demons as merely the symbolic expression of certain human social paradoxes. Demons *exist*, and are the enemies of the gods. Indeed, in India that is what demons primarily are: non-gods. In the earliest layer of the *Rgveda*, which still shares certain important links with Avestan mythology and looser ties with the Olympian gods and Titans, gods and demons were not different in nature or kind; they were brothers, the children of Prajāpati, the lord of creatures. The demons were the older brothers, and therefore had the primary claim on the kingdom of heaven; the gods were the usurpers. The gods triumphed, however, and post-Vedic mythology (beginning with the Brāhmaṇas) began to associate the divine victors with a cluster of moral virtues (truthfulness, piety, and all the other qualities of universal *dharma*) and the demonic losers with the corresponding moral flaws. The “good” demons of the medieval pantheon, therefore, were not so much upstarts as archconservatives, reclaiming their ancient right to be as virtuous as the gods of the arriviste establishment.

These palace intrigues in heaven had interesting repercussions on earth, in the relationship between humans and gods. In the *Rgveda*, humans and gods were pitted against demons. Humans and gods were bound to one another by the mutually beneficial contract of sacrifice: The gods kept humans prosperous and healthy in return for the offerings that kept the gods themselves alive and well and living in heaven. The demons were the enemies of both gods and humans; the major demons or *asuras* (the ex-Titans) threatened the gods in heaven, while the minor demons, or *rākṣasas* (more like ghouls or goblins), tormented people, both in their secular lives (killing newborn children, causing diseases) and in their sacred offices (interfering with the sacrifices that maintained the all-important bond between heaven and earth).

But with the rise of the ideal of renunciation as a challenge to the sacrificial order, these simple lines were broken.

For demons might offer sacrifice, but if they sacrificed to the gods they strengthened their enemies, which went against their own interests, while if they offered the libations into their own mouths (as they were said to do in the Brāhmaṇas) they exposed their innate selfishness, and the powers of truth and generosity abandoned them, taking with them their power to overcome the gods in battle. But if demons amassed ascetic power they could not be faulted on traditional moral grounds—for they had, in effect, renounced traditional moral grounds—and their power could not be neutralized by the powers of the gods. In this situation, demons were like human ascetics, who could bypass the entire Brahmanic sacrificial structure and strike out as religious loners, outside the system, with powers that, although gained by nonsacrificial methods, could nevertheless challenge the sacrificial powers of the gods on equal grounds, because the heat (*tapas*) generated by the ascetic was of the same intrinsically sacred nature as the heat generated by the sacrificial priest. In the myths, this challenge is expressed by the simple transfer of heat: The *tapas* generated by the demonic or human ascetic rises, as heat is wont to do, and heats the throne of Indra, the king of the gods; Indra immediately recognizes the source of his discomfort (for it recurs with annoying frequency) and dispatches from heaven a voluptuous nymph (an *apsaras*) to seduce the would-be ascetic by siphoning off his erotic heat in the form of his seed. In this middle period, therefore, the epic period in which Indra ruled in heaven, humans and demons could be pitted against the gods.

A further realignment took place with the rise of the great sectarian gods, Viṣṇu and Śiva. The mythology of the “good” demon brought into play a mythology of the “good” untouchable or the good non-*brahman* in local and vernacular traditions; one aspect of this development has been seen in the myths of the king among the untouchables. For in *bhakti* mythology the devotional gods are on the side of good humans and good demons alike; they are against only evil humans and evil demons. The straightforward lines of Vedic allegiance are thus sicklied o’er with the pale cast of morality. While in classical orthodox Hinduism, it was one’s action that mattered (*orthopraxy*), now it was one’s thought that mattered (*orthodoxy*). Thus, devotional Hinduism can be generous to untouchables, and even to Buddhists and Muslims, whose ritual activities made them literally anathema to orthodox Hinduism, but it can be bitterly intransigent toward wrong-thinking Hindus (and, of course, to wrong-thinking Muslims, Buddhists, and untouchables), no matter how observant they might be of caste strictures governing behavior. In this view, what one is (demon or untouchable) or what one does (kill, tan leather) is not so important as what one thinks, or, even more, feels (love for the true God).

ILLUSION. This emphasis on what is thought or felt in contrast with what is done or brought into existence is basic to all of Indian mythology. Its roots go back to the Vedas, where the gods use their powers of illusion (*maya*) not merely to delude the demons (themselves masters of illusion) but to create the entire universe. The Upanisadic doctrine that the

state of unity with the godhead is closer to dreaming sleep than it is to waking life (and closest of all to dreamless sleep) paved the way for the concept, already encountered in the myths of cosmogony, that the universe is merely a projection or emanation from the mind of a (sleeping) god, that humankind is all merely a dream of God. The belief that the gods are seen most closely in one’s dreams is encountered widely outside of India and accounts, in part, for the universal value set on premonitory dreams. But just as Indian philosophy, particularly Mahāyāna Buddhist philosophy, developed the doctrine of illusion to a pitch unknown in other forms of idealism, so too Indian mythology played countless imaginative variants on the theme of dreams and illusion.

In its simplest form, the theme could transform any myth at all into a myth of illusion: At the end of any number of complex adventures, the god appears *ex machina* to say that it was all nothing but a dream. All is as it was at the beginning of the story—all, that is, but one’s understanding of what the situation *was* at the beginning of the story. This is a motif that is known from other cultures (although not, one suspects, from any culture that could not have borrowed it from India). But in its more complex form, the theme of illusion is combined with the folk motif of the tale within a tale, the mechanism of Chinese boxes, with the peculiar Indian Möbius twist: The dreamers or tellers of tales are dreaming of one another, or the dreamer of the first in a series of nested dreams, one within the other, turns out to be a character inside the innermost dream in the series. Ultimately, the worshiper is dreaming into existence the god who is dreaming him into existence.

THE PANTHEON. This article has left until last the theme that is usually regarded as the meat and potatoes of mythology: the pantheon of gods and goddesses. These will all be treated separately elsewhere in this encyclopedia, so for this author it remains only to remark upon their interrelationships and the patterns of their interactions. The basic structure of the Indian pantheon might be viewed, appropriately enough in the home of *homo hierarchicus*, in terms of a decentralized hierarchy. At the center of the pantheon is a single god, or a godhead, recognized by most Hindus. They may refer to it (him/her) as the Lord (Īsvara), the One, the godhead (*brahman*), or by a number of other names of a generally absolute character. This godhead is then often identified with one of the great pan-Indian gods: Śiva, Viṣṇu, or the Goddess (Devī). The concept of a trinity consisting of Brahmā the creator, Viṣṇu the preserver, and Śiva the destroyer is entirely artificial, although it is often encountered in the writings of Hindus as well as Western scholars. If there is any functional trinity, it is the triangle of Śiva, who is married to Devī, who is the sister of Viṣṇu.

On the third level of differentiation, Viṣṇu may be worshiped in the form of one of his *avatāras* (of which Rāma and Kṛṣṇa are by far the most popular), and Śiva may be worshiped in one of his “manifestations” or “playful appearances” on earth. Devī is often identified with a local goddess

who brings as her dowry her own complex mythology. In general, local gods are assimilated to the pan-Indian pantheon through marriage, natural birth or adoption, or blatant identification: Durgā marries Śiva; Skanda is the natural son of Śiva; the demon Andhaka becomes Bhṛṅgin, the adopted son of Śiva; and Aiyanar is Skanda, a god by another name. These assimilations work in the upstream direction as well; the pan-Indian concept of the dancing Śiva probably originated in South India, and the erotic liaison of Kṛṣṇa and Rādhā in Bengal. Such cross-fertilizations result in gods and goddesses who are truly and literally multifaceted; their many heads and arms reflect not merely the many things that they are and can do, but the many places they have come from—and are heading toward.

At this point, the pantheon splinters into a kaleidoscope of images and tales that demonstrate how the one God became manifest right here, in Banaras or Gujrat or Madurai, how this particular temple or shrine became the center of the earth. For, like a hologram, the entire Indian mythological panorama is always present in its entirety in every single spot in the Indian world.

BIBLIOGRAPHY

There are several good introductory collections of Indian myths. Both my own *Hindu Myths* (Harmondsworth, U.K., 1975) and Cornelia Dimmitt and J. A. B. van Buitenen's *Classical Hindu Mythology* (Philadelphia, 1978) give translations of selected central texts. The latter inclines more to folkloric and localized Sanskrit traditions; the former leans more toward the classical themes and includes a detailed bibliography of primary and secondary sources. The available surveys are useful as reference works: Sukumari Bhattacharji's *The Indian Theogony* (Cambridge, U.K., 1970), Alain Daniélou's *Hindu Polytheism* (London, 1964), V. R. Ramachandra Dikshitar's *The Purāṇa Index* (Madras, 1955), E. Washburn Hopkins's *Epic Mythology* (1915; reprint, New York, 1969), A. A. Macdonell's *Vedic Mythology* (1897; reprint, New York, 1974), Vettam Mani's *Puranic Encyclopaedia* (Delhi, 1975), and Sören Sörensen's *An Index to the Names in the Mahābhārata*, 13 pts. (London, 1904–1925).

Most of the primary sources for Indian mythology in Sanskrit are now available in English translations of varying reliability. For the *Rgveda*, see my *The Rig Veda* (Harmondsworth, U.K., 1982); for the Brāhmaṇas, see Arthur Berriedale Keith's *Aitareya and Kauṣītaki Brāhmaṇas* (Cambridge, Mass., 1920); Julius Eggeling's *The Śatapatha Brāhmaṇa*, 5 vols., "Sacred Books of the East," vols. 12, 26, 41, 43, and 44 (Oxford, 1882–1900; reprint Delhi, 1966); Willem Caland's *The Pañcaviṃśa Brāhmaṇa* (Calcutta, 1931); and A. A. Macdonell's *The Brhaddevatā Attributed to Śaunaka* (Cambridge, Mass., 1904). The *Mahābhārata* has been completely if awkwardly translated by Pratap Chandra Roy and K. M. Ganguli, 12 vols. (1884–1896; 2d ed., Calcutta,

1970); a fine new translation by J. A. B. van Buitenen, terminated by his death when he had completed only five of the eighteen books (Chicago, 1973–1978), is in process of completion by the University of Chicago Press at the hands of a team of translators. The *Rāmāyaṇa* has been completely if clumsily translated by Hari Prasad Shastri, 3 vols. (London, 1962), and is now being properly translated by Robert P. Goldman and others and published by Princeton University Press.

The Purāṇas, which are the main sources for the study of Hindu mythology, are now becoming available in English translations in several different series: "Ancient Indian Tradition and Mythology" (AITM), published by Motilal Banarsidass in Delhi; the "All-India Kashiraj Trust" (AIKT), in Varanasi; and two older series that have recently been resurrected, the "Chowkhamba Sanskrit Series" (CSS), in Varanasi, and the "Sacred Books of the Hindus" (SBH), originally published in Allahabad and now republished in New York by AMS Press. These are the Purāṇas that have emerged so far:

Agṇipurāṇam. 2 vols. Translated by M. N. Dutt. CSS, no. 54. Calcutta, 1901; reprint, Varanasi, 1967.

Bhāgavata. 4 vols. Translated by Gānesh Vasudeo Tagare. AITM, nos. 7–10. Delhi, 1976.

Brahmāṇḍa. 5 vols. Translated by Ganesh Vasudeo Tagare. AITM, nos. 22–26. Delhi, 1983.

Brahma-vaivarta Purāṇam. 2 vols. Translated by Rajendra Nath Sen. SBH, no. 24. Allahabad, 1920–1922; reprint, New York, 1974.

Śrīmad Devī Bhāgavatam. Translated by Swami Vijnanananda. SBH, no. 26. Allahabad, 1922–1923, issued in parts; reprint, New York, 1973.

Garuḍapurāṇam. Translated by M. N. Dutt. CSS, no. 67. Calcutta, 1908; reprint, Varanasi, 1968.

Kūrma Purāṇa. Translated by Ahibhushan Bhattacharya and edited by Anand Swarup Gupta. Varanasi, 1972.

Liṅga Purāṇa. 2 vols. Edited by Jagdish Lal Shastri and translated by a board of scholars. AITM, nos. 5–6. Delhi, 1973.

Markandeya Purāṇa. Translated by F. Eden Pargiter. Bibliotheca Indica. Calcutta, 1888–1904, issued in parts; reprint, Delhi, 1969.

Matsya Purāṇam. 2 vols. Translated by a *talūqdar* of Oudh. SBH, no. 17. Allahabad, 1916–1919.

Śiva Purāṇa. 4 vols. Edited by Jagdish Lal Shastri and translated by a board of scholars. AITM, nos. 1–4. Delhi, 1970.

Vāmana Purāṇa. Translated by Satyamsu M. Mukhopadhyaya and edited by Anand Swarup Gupta. Varanasi, 1968.

Viṣṇu Purāṇa. Translated by H. H. Wilson. London, 1940; 2d ed., Calcutta, 1961.

For a complete list of Sanskrit editions of the Purāṇas, see my *Hindu Myths*, cited above.

There are also several useful studies of selected Indian mythic themes. Still the best introduction is Heinrich Zimmer's *Myths and Symbols in Indian Art and Civilization*, edited by Joseph Campbell (1946; reprint, Princeton, 1972). Also helpful is Arthur Berriedale Keith's *Indian Mythology*, vol. 6, pt. 1, of *The Mythology of All Races*, edited by Louis H. Gray

(1917; reprint, New York, 1964). There are also a number of books devoted to particular gods or mythic themes: for Tamil mythology, David Dean Shulman's *Tamil Temple Myths* (Princeton, N.J., 1980); for gods and demons, my *The Origins of Evil in Hindu Mythology* (Berkeley, Calif., 1976); for cosmology, Richard F. Gombrich's "Ancient Indian Cosmology," in *Ancient Cosmologies*, edited by Carmen Blacker and Michael Loewe (London, 1975); for Kṛṣṇa, John Stratton Hawley's *Krishna, the Butter Thief* (Princeton, N.J., 1983) and *At Play with Krishna* (Princeton, N. J., 1981); for Śiva, my *Śiva, the Erotic Ascetic* (Oxford, 1981); for Devī, *The Divine Consort: Rādhā and the Goddesses of India*, edited by John Stratton Hawley and Donna M. Wulff (Berkeley, Calif., 1982) and my *Women, Androgynes, and Other Mythical Beasts* (Chicago, 1980); for the myths of illusion, my *Dreams, Illusion, and Other Realities* (Chicago, 1984). Finally, no study of Indian mythology can fail to take into account the writings of Madeleine Biardeau, particularly her *Clefs pour la pensée hindoue* (Paris, 1972); *Études de mythologie hindoue*, 4 vols. (Paris, 1968–1976); and her essays in the *Dictionnaire des mythologies*, edited by Yves Bonnefoy (Paris, 1981).

Revised Bibliography

INDIAN RELIGIONS: HISTORY OF STUDY

As is the case with other great traditions, the study of and interest in Indian religions cannot be described in terms of academic research alone; nor is it confined to the accumulation of factual information. It also involves questions of motivation, hermeneutic conditions, religious commitment, philosophical reflection, and interaction and dialogue between India and the West. It reflects the work and attitudes of missionaries and philologists, travelers and philosophers, anthropologists and theologians. It has roots and repercussions in the general trends and developments of Western science, religion, and philosophy. Its impact upon Indian as well as Western self-understanding is undeniable and still

growing. More than other religions, Indian religions and specifically Hinduism are integrated into the totality of forms of culture and life, and to that extent, Indian studies in general have a direct or indirect bearing upon the religion of Hinduism. In such broad and comprehensive application, the term *religion* itself has become subject to questioning and reinterpretation.

BEGINNINGS OF INDOLOGICAL RESEARCH. Although institutionalized Indological research and systematic and organized study of Indian religions are not older than two centuries (initiated in part by the foundation in 1784 of the Asiatic Society of Bengal and by the establishment in 1814 of the first chair for Indian studies at the University of Paris), the Western encounter with the Indian religious tradition was by no means an unexpected and unprepared event. Since the days of classical Greece, and in particular since the Indian campaign of Alexander the Great (327–325 BCE), there has been interest in and speculation about Indian wisdom and religion. On the one hand, such interest was nurtured by the idea that the origins of the Greek religious and philosophical tradition were to be found in the East; on the other hand, it may also have reflected a search for alternatives and correctives to the Greek tradition. In spite of this interest, however, verifiable contacts between West and East were rare; the linguistic and cultural barriers were usually insurmountable. Even Megasthenes, the Greek ambassador at the Maurya court in Pataliputra (today Patna, Bihar) from 302 to 291 BCE, was unable to explore Indian religion in its original textual sources. The rise of the Sassanid empire and then of Islam virtually precluded direct contacts between India and Europe for many centuries, and there was little more than a repetition and rearrangement of the materials inherited from Greek and Roman antiquity. However, a highly original and thorough study of India, based upon textual sources as well as travel experiences and accompanied by an unprecedented hermeneutic awareness, was produced in Arabic by the great Islamic scholar al-Bīrūnī (973–1051). But his work remained unknown in contemporary Europe, and even in medieval Islam it was a unique and somewhat isolated phenomenon.

The Portuguese explorers who reopened direct Western access to India (a development marked by Vasco da Gama's arrival in 1498 in the South Indian port city of Calicut) were motivated not by any interest in Indian religion or philosophy but by trade and missionary interests. Yet, the urge to teach and to proselytize turned out to be a powerful incentive to explore the contexts and conditions for spreading the Christian message. For several centuries, missionaries were the leading pioneers in the study of Indian languages and of Indian religious thought. Their greatest representative, Roberto de Nobili (1577–1656; active in Madurai, South India), learned Tamil and Sanskrit and acquired an unequaled knowledge of the Indian tradition. But his writings remained unpublished during his lifetime and were only recently rediscovered. The work of another missionary, Abraham Roger's Dutch-language *De opendeure tot het verborgen*

heyndom (The open door to the hidden heathendom), published in 1651, was translated into other European languages and widely used as a sourcebook on Indian religion. The works of travelers like François Bernier and Jean-Baptiste Tavernier provided additional information.

The ideological movements of Deism and the Enlightenment opened new perspectives on India and on non-Christian religions in general. One characteristic argument (used, for example, by Voltaire) was that the basic ideas concerning God and religion are older, more original, and less deformed in the ancient cultures of Asia than in the Christian West. Similarly, a certain deistic openness toward a universal religion can be found in the works of two eighteenth-century British pioneers of the study of Hinduism, Alexander Dow and John Z. Holwell. Like them, the French scholar A.-H. Anquetil-Duperron (1731–1805) did not have direct access to Sanskrit; instead, his Latin version of fifty Upaniṣads, published in two volumes in 1801–1802 under the title *Oupnek'hat* and of seminal importance for the appreciation of Indian religious thought in continental Europe, was based upon a Persian translation (*Sirr-i Akbar*, 1657). Even William Jones (1746–1794), founder of the Asiatic Society of Bengal and one of the most influential pioneers of modern Indology, initially studied Persian before gaining access to the Sanskrit language. Charles Wilkins (1749–1836), the first English translator of the *Bhagavadgītā* (1785), and Henry Thomas Colebrooke (1765–1837), whose wide-ranging studies set new standards for Indian studies, continued the work of Jones. The general British attitude toward India was, however, under the impact of more practical interests, and, accordingly, it viewed Indian religion most often in its association with social, administrative, and political issues.

The situation was significantly different in continental Europe, and specifically in Germany, where the Romantic movement produced an unparalleled enthusiasm for ancient India, celebrated as the homeland of the European languages and of true religion and philosophy. German scholars contrasted the original spiritual purity and greatness of India with a progressive degeneration and obscurity in more recent times. In several cases, this enthusiasm led to a serious study of the original sources and to a more sober assessment; a certain disenchantment, for example, is documented in Friedrich Schlegel's classic *Über die Sprache und Weisheit der Indier* (On the language and wisdom of the Indians, 1808). August Wilhelm Schlegel, who shared his brother's early enthusiasm, became the first professor of Indology in Germany (at the University of Bonn in 1818) and a pioneer in the philological treatment of Indian texts. The Romantic influence persisted to the time of F. Max Müller (1823–1900), a German-born leader of nineteenth-century Indology and at Oxford University an influential advocate of comparative religion and mythology. In general, the discovery of the Indian materials had a special, often decisive impact upon the development of comparative studies in the humanities.

CLASSICAL INDOLOGY. Textual and historical scholarship of the nineteenth century has laid the foundations for the current access to ancient and classical Indian sources. Dictionaries prepared during this period as well as catalogs of manuscripts and editions and translations of religious texts are still considered indispensable. Throughout the nineteenth century there was a particular fascination with the Vedas, the oldest religious literature of Hinduism, and especially with the *Rgveda*. The first complete editions of the *Rgveda* were prepared by F. Max Müller (1849–1874) and Theodor Aufrecht (1861–1863). Müller saw in it the origins and early developments of religion as such; his contemporary Rudolf Roth took a more philological approach. Interest in the vast ritualistic literature of the Brāhmaṇas remained more limited, and pioneering work was done by Albrecht Weber (1825–1901) and Willem Caland (1859–1932). For earlier scholars the Vedas had been primarily a record of Indo-European antiquity, and at the core of its religious impulse they had seen a mythology of natural forces. Subsequently, other dimensions of the Vedas were emphasized, and they were interpreted more specifically in their Indian context and with reference to later developments. Moreover, Western interest in the Vedic and Upaniṣadic texts further enhanced their reputation in India. Between 1816 and 1819 the Bengali reformer Ram Mohan Roy published Bengali and English translations of some of the Upaniṣads, which in Anquetil-Duperron's Latin version had already impressed European thinkers, most conspicuously Arthur Schopenhauer; Roy is an early example of an Indian author who contributed to the modern exploration and dissemination of ancient Indian religious documents. Toward the end of the nineteenth century, Schopenhauer's admirer Paul Deussen (1845–1919) made further significant contributions to the study of the Upaniṣads and to the Vedānta system, which is built upon the interpretation of the Upaniṣads.

The great epics the *Mahābhārata* and the *Rāmāyaṇa* were studied as both religious and literary documents. In particular, the most famous episode of the *Mahābhārata*, the *Bhagavadgītā*, which was first translated into English by Charles Wilkins (1785) and has since appeared in numerous new translations and editions, has become in the present time the most popular piece of Indian religious poetry in the West. The Purāṇas, by contrast, attracted much less interest in spite of the outstanding efforts of H. H. Wilson (whose English translation of the *Viṣṇu Purāṇa* was published in 1840) and Eugène Burnouf (whose edition and French translation of the *Bhāgavata Purāṇa* was published 1840–1847; a French version based upon a Tamil version had been published in 1788). A full exploration of this vast literature has begun only in the twentieth century. Serious scholarly work on the Tantras has lagged behind still further and is still in its infancy. The collection and description of Tantric manuscripts begun by Rajendralal Mitra and others, and the editions and studies done in this area by John George Woodroffe (pseudonym, Arthur Avalon), the chief justice of Bengal, broke new ground. R. G. Bhandarkar's *Vaiṣṇavism, Śaivism*

and *Minor Religious Systems* (1913) gave an authoritative summary of the information on sectarian Hinduism available at the time it was written.

Apart from his extensive Vedic studies and his contributions to other fields such as Brahmanic literature, Albrecht Weber laid the foundations for modern Jain studies, an area in which he was followed by scholars like Georg Bühler and Hermann Jacobi, who established the distinctive and extra-Vedic character of the Jain tradition. Another representative Indologist of the nineteenth century, Monier Monier-Williams (1819–1899), tried to combine textual learning with an understanding of living Hinduism and of practical missionary and administrative problems; this effort was visible, for example, in his work *Modern India and the Indians* (1878). By and large, popular Hinduism and the practical, institutional, or social dimensions of Indian religions were not among the topics of classical Indological research. Up to the beginning of the twentieth century, these phenomena were recorded principally by missionaries in accounts such as the controversial yet very influential report of Jean-Antoine Dubois entitled *Hindu Manners, Customs and Ceremonies* (1816, a translation of a French manuscript completed in 1805–1806). Further valuable information on social and religious life was provided by various gazetteers of India. Missionaries or scholars with missionary background also contributed richly to the study of religious literature in vernaculars, especially in South India, where they compiled most of the early dictionaries of Dravidian languages; and they produced as well the first accounts of the tribal religions of India, which are more or less outside the great scriptural traditions. The missionary J. N. Farquhar covered the whole range of Hindu religious literature in his still useful *Outline of the Religious Literature of India* (1920); his *Modern Religious Movements in India* (1915) is one of the first surveys of neo-Hinduism and related phenomena.

PHILOSOPHICAL APPROACHES TO INDIAN RELIGIONS. The results of Indological research have affected the thought of various Western theologians and philosophers. In turn, Western systems of thought have provided motivations and interpretive frameworks for the study of Indian religions or have even influenced Indological research directly. These influences are exemplified by three important nineteenth-century philosophers, namely, G. W. F. Hegel (1770–1831), Arthur Schopenhauer (1788–1860), and Auguste Comte (1798–1857).

Hegel rejects the Romantic glorification of India. Nonetheless, he is a careful witness of the beginnings of Indological research and deals with Indian religious thought and life in considerable detail. In Hegel's view, the way of the *Weltgeist* ("world spirit") leads from East to West. Eastern and in particular Indian thought represents an introductory and subordinate stage of development that has been transcended (*aufgehoben*, i.e., canceled, conserved, and exalted all at once) by the Christian European stage. The inherent and distinctive principle of Indian religion and philosophy (systems that

Hegel sees as inseparable) is the orientation toward the unity of one underlying "substance." God is conceived of as pure substance or abstract being (*brahman*), in which finite beings are contained as irrelevant modifications. The individual human person has to subdue and extinguish individuality and return into the one primeval substance. In this light, Hegel tries to give a comprehensive and coherent interpretation of all phenomena of Indian life and culture and to establish the basically static, ahistorical character of the Indian tradition. Whatever the deficiencies of this interpretation may be, it has had a significant impact upon the treatment of India in the general histories of religion, and it has largely contributed to the long-lasting neglect of Indian culture in the historiography of philosophy.

Schopenhauer's association with Indian thought is much more familiar to Western readers than that of Hegel, and his attitude is conspicuously different. He does not accept any directedness or progression in history, and he can recognize insights and experiences of foreign and ancient traditions without having to subordinate them to the European standpoint. In the religious metaphysics of Vedānta and Buddhism he rediscovers his own views concerning the "world as will and representation" and the undesirability of existence, and he claims these traditions as allies against what he considers to be the errors and evils of the Judeo-Christian tradition, such as the belief in historical progress and in the uniqueness of the human person. He sees the Old Testament as a worldly book without the genuine sense of transcendence and of final liberation that he discovers in the Indian religious documents. In the New Testament he finds more to appreciate; his speculations that its teachings were influenced by Indian sources are not uncommon in the nineteenth century. He hopes that the Indological discoveries will initiate a "New Renaissance." While in fact this may not have happened, Schopenhauer's ideas nevertheless have stimulated much interest in Indian and comparative studies, though largely outside the academic world. Among the followers of Schopenhauer who contributed to the textual exploration of Indian religion and philosophy Paul Deussen remains the most outstanding example.

Comte does not show any noticeable interest in Indian thought, but his conception of "positive philosophy" and his programmatic ideas about transforming philosophy into sociology and anthropology (i.e., the systematic study of the human phenomenon) have set the stage for important developments in European, specifically French intellectual and scholarly life, such as the work of Lucien Lévy-Bruhl, Émile Durkheim, and Marcel Mauss in ethnology, sociology, and religious studies. In general, these writings have provided a broad ideological background for the anthropological and sociological study of religion. Paul Masson-Oursel's *La philosophie comparée* (1923; translated as *Comparative Philosophy*, 1926) reflects this tradition in its own way. By juxtaposing and comparing the "facts" of philosophical and religious thought in India, China, and Europe, Masson-Oursel tries

to explore the full range of human potential and to discover the basic regularities of its development. Indeed, he presents himself as a disinterested cartographer of the human mind, an observer no longer attached to one particular cultural tradition or metaphysical viewpoint.

The three approaches just outlined remain exemplary and influential. There are, of course, numerous variants, as well as other, genuinely different approaches. Among the latter is a wide spectrum of attempts to find a common core or horizon of religiosity or a "transcendent unity of religions" (as proposed by Frithjof Schuon) or to approach the Indian tradition in the name of "religious experience" or "comparative mysticism" (as proposed by Rudolf Otto); another approach, with a psychological and agnostic emphasis, was taken by William James. Again, instead of Hegel's European self-confidence or the rigid Christian absolutism of such theologians as Karl Barth, there is now found a variety of more or less far-reaching ideas about encounter and dialogue, adaptation, and even synthesis. Among Catholic theologians, Karl Rahner has set new standards of openness toward other religions. Psychological or psychoanalytic methods and viewpoints have repeatedly been applied to the study of Indian religions, most conspicuously and influentially in the works of C. G. Jung and some of his followers. Other methodologies or ideologies, too, have had an explicit or implicit bearing upon the study of Indian religions; in particular, structuralist orientations have gained momentum. A Marxist interpretation of the Indian tradition exists as well, represented by Walter Ruben and others.

SCIENTIFIC CONTRIBUTIONS. The study of Indian religions by anthropologists and other social scientists is largely a phenomenon of the period after 1945. These studies rely principally on field investigations of living communities to generate their descriptions and models of Indian religions, and only indirectly on historical works or classical textual sources.

From their predecessors in the study of Indian religions, social scientists have inherited the following major questions about Indian religions. What is the nature and structure of the dominant religious traditions of India? What is the relationship between the legacy of norms, concepts, and beliefs contained in the great textual traditions of India and the day-to-day religious lives of its people? In what way does religion in India affect social structure (and, in particular, the caste system)? To what degree do the religions of India inhibit its economic development and vigor? Social scientists have inherited also a tendency to focus on Hinduism, the majority religion of the subcontinent, so that minority religions, including Islam, have till recently not been the focus of sustained research except insofar as they support or refute ideas about Hindu social forms.

In the period since 1945, social scientists trained principally in India, England, France, and the United States have translated these overarching questions into a series of more manageable ones about the functioning of religion at the village level of Indian society, addressing the following subjects:

the ritual aspects of hierarchy in village life; the structure of the village pantheon; the links between social mobility and changed religious practices; the Hindu grammar of purity and pollution; indigenous ideas about power and authority; Indian explanations of fate, misfortune, and determinacy; and Hindu conceptions of space and time, death and liberation. Although much of this investigation has been conducted and communicated within the village framework, there has been throughout this period a concomitant countertradition of synthetic works that aim to capitalize on and generalize from these many local studies. The four decades after 1945 can, for expository convenience, be divided into three phases, which are sequentially discussed below. The following discussion focuses on major or representative works, approaches, and authors, rather than on more specialized, peripheral, or transient trends.

The first phase, which began in 1945, was dominated by the publication of *Religion and Society among the Coorgs of South India* by M. N. Srinivas (1952). In this study, Srinivas used the term *Sanskritization* to characterize a general mobility strategy that enabled Coorgs, and many other groups, either to enter the social fold of Hinduism or to rise within its hierarchy. This concept, which has been much invoked, debated, and refined since then, rested on the assumption of a critical historical, linguistic, and conceptual gap between local religious beliefs and customs and those of what Srinivas called "Sanskritic Hinduism," that is, the Hinduism of esoteric texts, literate priests, and cosmopolitan centers. This approach dovetailed very fortuitously with the ideas of the American anthropologist Robert Redfield regarding the difference between "great" and "little" traditions in peasant civilizations. Subsequently, an influential group of anthropologists centered at the University of Chicago set themselves to refining, synthesizing, and operationalizing the ideas of Redfield and of Milton Singer as they applied to Indian religions and society. A collection of essays edited by McKim Marriott and titled *Village India* (1955) signals the beginning of this trend, and Singer's *When a Great Tradition Modernizes* (1972) marks its zenith. This latter work also contains the most thorough anthropological critique available of Max Weber's influential thesis about the antagonism between caste ideology (with its Hindu assumptions) and modern capitalistic enterprise. This first phase, rooted in the empirical study of village religion, was dominated by the problem of reconciling village-level diversities with what were perceived as pan-Indian uniformities in religious belief and practice.

In the second phase, inaugurated by the publication of *Homo Hierarchicus: The Caste System and Its Implications* by Louis Dumont (1966; first English translation, 1970), this problem was largely replaced by a concern to analyze the conceptual core of Hinduism. Dumont, whose intellectual starting point was the opposition of pure and impure in Hindu thought (an opposition first remarked by Celestin Bougle, 1908), denied the conceptual gap between "great"

and “little” traditions on the grounds of a shared conceptual scheme that animated Indian religious systems at all levels. He argued that the Hindu religious understanding of hierarchy was the philosophical basis of the caste system, and suggested that there was a radical incompatibility between approaches appropriate to the analysis of Western societies, which assume the axiomatic importance of equality and the individual, and those appropriate to the study of Indian society, with its cultural axiom of hierarchy—based on religiously defined purity—and its assumption of the priority of the social group. Dumont’s work, in spite of its controversial qualities, has generated two decades of anthropological and sociological writing on India characterized by a concern with hierarchy, an almost exclusive focus on Hinduism, and a tilt toward the conceptual rather than the behavioral aspects of religious life in India.

Starting approximately in 1975, there has been a turning away from some of these larger debates and a return to more focused ethnographic and thematic investigations. Recent approaches have included anthropological analysis of both specific Hindu texts and textual traditions in an effort to learn of their cosmological assumptions; more systematic effort to investigate the local incarnations and involutions of dominant civilizational concepts; and a rediscovery of oral traditions, which, together with local performance genres, reveal important variations on civilizational themes and motifs. This most recent phase continues to explore traditional problems in the study of Indian religions, but makes more explicit and self-conscious use of methods and theories developed recently in folklore, linguistics, and philosophy. But perhaps the most promising recent trend has been the turn toward historical analyses of religious institutions, processes, and symbolic forms, a shift that has involved renewed dialogue between historians and anthropologists. This trend has produced a number of studies reminding researchers that Indian religions are not unchanging ways of expressing timeless truths.

RECENT TRENDS AND DEVELOPMENTS. There is no single spectacular work separating modern from traditional Indology; instead, there is continuation and expansion, combined with gradual changes in orientation. The tradition of classical Vedic scholarship has been continued by Heinrich Lüders, Louis Renou, Jan Gonda, and others; these scholars have also reexamined the problems of continuity and change between Vedic and Hindu India. The quantity of available source materials has increased rapidly, and more scholars of different geographical, cultural, and religious origins and disciplinary backgrounds participate now in the process of research, which is no longer a primarily European affair. In the United States, the tradition of classical Indology (first represented by scholars such as William Dwight Whitney and Maurice Bloomfield) continues to some extent; but the study of Indian religion is pursued more vigorously in the context of other disciplines and of so-called area studies in the university curriculum. In Japan, which adopted Western academic institutions and methods of research in the late

nineteenth century, research interests have focused on Buddhism, but much significant work has been done also on the other religious traditions of India, primarily in the field of textual studies (by Ui Hakuju, Nakamura Hajime, and others). From the beginning of modern Indology, the participation of Indians as collaborators in the process of research and as interpreters of their own tradition has been indispensable. In the twentieth century, particularly since India’s independence (1947), their role has become more active, and their growing presence at Western universities, specifically in North America, has had a significant impact upon the exploration and teaching of Indian religions. Indian scholars have not traditionally been attracted by historical and philological methods; yet certain massive projects necessitating such methods could be executed properly only in India. Such a project was the critical edition of the *Mahābhārata*, which was inspired by Western philologists but actually produced in India (by V. S. Sukthankar and others). More recently, Indians have begun a systematic textual exploration of the Purāṇas, Āgamas, and Tantras, and of the vast devotional and philosophical literature of the sectarian movements. Still, there is on their part some reluctance to devote serious scholarly attention to religious literature considered to have lesser theoretical status (such as the *māhātmya* literature) or written in a vernacular language. The wide field of connections between religious texts on the one side and art, architecture, and iconography on the other also remains an important area for further studies; scholars like Ananda K. Coomaraswamy and Stella Kramrisch have made stimulating, though to some extent controversial, contributions in this area.

Much work remains to be done in the study of Indian religions. A new area of research (and speculation) was opened during the 1920s by the archaeological discovery of the pre-Vedic Harappan civilization; the religious practices of this civilization and its connection with Vedic India are still open to question. The Vedas themselves are being approached in new and unorthodox ways, for example, in the *soma* studies of R. Gordon Wasson. The vastness of classical and later Sanskrit materials available for study is made evident by the *New Catalogus Catalogorum* (edited since 1949 by V. Raghavan, continued by K. Kunjunni Raja), a comprehensive listing of extant Sanskrit texts. In addition, the materials in Prakrit (specifically in Jainism) and numerous South and North Indian vernaculars still await comprehensive cataloging and exploration. These are particularly relevant for the study of sectarian and theistic movements, such as the South Indian Śaiva Siddhānta or Śrī Vaiṣṇava traditions; moreover, the increasing awareness of the details and inner differentiations of the Hindu tradition leads to new questions concerning its identity and coherence and its manifold and ambiguous relations to Buddhism and Jainism, but also to Islam, which has been present in India for more than a thousand years, and finally to Christianity. This emergent complexity has been an occasion for discussions concerning the meaning and applicability of the idea of tolerance in the Indian con-

text. Furthermore, because of the pervasive role of religion in India, its study has to be based upon a wide variety of sources, including, for example, the Dharmaśāstras (law books); the work of such Dharmaśāstra scholars as P. V. Kane is immediately relevant for the study of Indian religion. More specifically, philosophical literature supplements religious literature because it is, with few exceptions, built upon religious foundations or motivated by religious goals; it also provides religious practices and ideas with a theoretical framework that at times challenges conventional Western understanding of such theological concepts as revelation, grace, or creation. Such interdependence gives the work of historians of Indian philosophy—for example, Surendranath Dasgupta—obvious importance for the study of Indian religion.

In the past few decades, the relationship of textual norms and theories to actual religious life has become an increasingly significant issue. A variety of nontextual approaches have been suggested to correct or supplement the understanding that can be gained from the texts alone. Combinations of textual and nontextual methods have been applied to such topics as the caste system, world renunciation, religious devotion (*bhakti*), and the doctrine of *karman* and rebirth in order to clarify not only their theoretical meaning but also their practical functions in the life of the Indian people. By means of such combined methods, local cults are correlated and contrasted with the standards of the great traditions; precept and practice, text and social context are investigated in their mutual relations. The pioneering works of Max Weber (1864–1920) continue to have an impact upon the sociological study of Indian religion. Anthropologists and other specialists have tried to construe theoretical frameworks to be applied to the textual-contextual continuum and to provide heuristic models for further research in this direction.

In a general and inevitably simplifying sense, it may be said that three basic attitudes dominate the current study of Indian religion:

- (1) the historical and philological approach, which derives its data and its direction from the Indian texts themselves and is primarily interested in historical reconstruction;
- (2) the sociological and anthropological approach, which tries to understand religious life in a functional manner, with reference to—or even directly in terms of—social, economic, ethnographic, political, and behavioral phenomena; and
- (3) the more existentially or ideologically involved approaches, which find in the Indian religious tradition a genuine religious, philosophical, or theological challenge and which respond to it in the name of specific worldviews or religious convictions.

These three approaches are not mutually exclusive; they can be and have been combined with one another. Still, they rep-

resent clearly distinguishable types of scholarly interest and orientation.

Finally, the development of Indological studies in the West has had a remarkable influence on India's interpretation of its own traditions. Not only do Indians now participate in the Western study of their religious past, but they also respond to it and to the challenge of Western thought in general, thus opening a religious dialogue with potentially far-reaching implications. Traditional Indian thought had not previously sought such dialogue or shown interest in non-Indian traditions, and yet it has produced a rich heritage of debate and refutation, as well as of coordination and harmonization of different standpoints. But foreign religions, including Islam and Christianity, did not become part of this process until the beginning of the nineteenth century, when Hinduism opened itself to the impact of Western ideas and entered into a fundamentally new relationship with the non-Indian world. At that time, Ram Mohan Roy (1772–1833) and others initiated a movement of reform and modernization of Hinduism that combines apologetics and self-affirmation with reinterpretation, adaptation, and universalization.

Thus, Western ideas and terms have been used not only to interpret the Indian religious tradition to foreigners but also to articulate a new Indian self-understanding. Modern reinterpretations of such key concepts as *dharma* exemplify the ambiguity of India's reaction to the Western challenge and specifically to the Christian notion of religion. In response to missionary activities, Christianity and other religions have been readily incorporated into traditional Hindu schemes of concordance, where they appear as different approaches to the same goal or as preliminary stages on a path often seen as culminating in the philosophical religion of Advaita Vedānta. In this context, "comparative religion" has found many advocates in India; similarly, against the Hegelian subordination of Asian thought to that of the West, Brajendranath Seal (1864–1938) formulated his program of "comparative philosophy." In general, there has been a tendency to respond to science and technology and to Western political domination by invoking religion and spirituality, which have been presented as genuinely Indian phenomena by such successful advocates of neo-Hinduism as Vivekananda (1863–1902; represented Hinduism at the World Parliament of Religions, Chicago, 1893). The concept of religious experience plays a crucial role in the modern self-presentation of Hinduism in the West. In increasing numbers, Indian scholars, teachers, gurus, and founders of syncretistic movements have come to the West and contributed to a growing awareness of the Indian religious tradition. At the same time, these developments are themselves continuations and transformations of the tradition, and they are a legitimate topic of study and research. Among those who have contributed to the scholarly and critical evaluation of Neo-Hinduism, Paul Hacker (1913–1979) ought to be mentioned especially.

The hermeneutic and religious position of neo-Hinduism is still problematic and tentative and has had difficulties in finding an adequate language for presenting the Indian religious tradition to the modern world. Accordingly, the situation of the religious dialogue between India and the West is still precarious. Nonetheless, the fact that the Indian religious tradition is no longer just an object of Western study but now speaks back to the West, questioning some of the very basic presuppositions of Western historical research, is in itself a highly significant event. It affects not only the modern Western perception of India but also the religious and philosophical situation of the modern world.

BIBLIOGRAPHY

Dandekar, R. N., and V. Raghavan, eds. *Oriental Studies in India*. New Delhi, 1964. A survey of Asian, primarily Indian, studies with sections on Vedic, Dravidian, and Islamic studies, philosophy and religion, archaeology, and so on, including a list of centers of teaching and research in India.

Dell, David, et al. *Guide to Hindu Religion*. Boston, 1981. A generously annotated bibliography of studies of Hinduism, covering such areas as history of Hinduism, religious thought, sacred texts, rituals, sacred locations, soteriology; emphasis on more recent contributions; not always fully reliable.

Gonda, Jan, et al. *Die Religionen Indiens*. 3 vols. Stuttgart, 1960–1963. One of the most comprehensive surveys of research on the religions of India, primarily from the standpoint of textual and historical studies. This survey is further extended in Gonda's *Viṣṇuism and Śivaism: A Comparison* (London, 1970).

Hacker, Paul. *Kleine Schriften*. Wiesbaden, 1978. A comprehensive collection of articles in German and English by a scholar whose studies of Indian religion combine a thoroughly philological orientation with theological and philosophical commitment; important methodological discussions and references to neo-Hinduism.

Halbfass, Wilhelm. *Indien und Europa: Perspektiven ihrer geistigen Begegnung*. Basel, 1981. A study of the intellectual and spiritual encounters between India and Europe, of the patterns of mutual understanding in the areas of religion and philosophy, and of the beginnings of Indological research.

Holland, Barron. *Popular Hinduism and Hindu Mythology: An Annotated Bibliography*. Westport, Conn., 1979. A useful bibliographical guide (including sections on "sacred literature," etc.), although the annotations are extremely short and often not very helpful.

Mandelbaum, David G. *Society in India*. 2 vols. Berkeley, Calif., 1970. This general introduction to the anthropological study of Indian civilization also contains (in chapters 28–31 of volume 2) the best introduction, for the nonspecialist, to the social and historical dynamics of Indian religions.

O'Flaherty, Wendy Doniger, ed. *Karma and Rebirth in Classical Indian Traditions*. Berkeley, 1980. A collection of essays, by authors with varied backgrounds, on one of the most fundamental ideas in Indian religious thought.

Otto, Rudolf. *Mysticism East and West: A Comparative Analysis of the Nature of Mysticism* (1932). New York, 1960. Although somewhat obsolete, still an exemplary approach to the Indian religious tradition by a liberal Christian theologian.

Radhakrishnan, Sarvepalli. *The Hindu View of Life* (1927). London, 1968. Not a contribution to the academic study of Hinduism, but one of the most eloquent and successful statements of neo-Hinduism, exemplifying its basic patterns of reinterpretation and modernization.

Renou, Louis. *Bibliographie védique*. Paris, 1931. An exemplary bibliography of scholarly literature on the Vedas. A sequel to this work is R. N. Dandekar's *Vedic Bibliography*, 3 vols. (Bombay and Poona, 1946–1973).

Schwab, Raymond. *La renaissance orientale*. Paris, 1950. Translated by Gene Patterson-Black and Victor Reinking as *The Oriental Renaissance* (New York, 1984). A comprehensive and richly documented account of the seminal period between 1770 and 1850, when the foundations were laid for modern Indology and for a new appreciation of Indian religion and philosophy; equally detailed on academic and nonacademic developments; analyzes thoroughly the intellectual background of Indian and Oriental studies. The translation is not always reliable.

Smith, Bardwell L., ed. *Hinduism: New Essays in the History of Religions*. Leiden, 1976. A collection of eight contributions, exemplifying recent approaches to the study of Hinduism, including structuralism.

Windisch, Ernst. *Geschichte der Sanskrit-Philologie und indischen Altertumskunde*. 2 vols. Strasbourg, 1917–1920. Though incomplete, somewhat obsolete, and not extending beyond 1900, this remains the most thorough and comprehensive survey of the history of Indology and of the textual exploration of Indian religion.

Zimmer, Heinrich. *Myths and Symbols in Indian Art and Civilization* (1946). Edited by Joseph Campbell. Princeton, 1972. A somewhat idiosyncratic, yet stimulating and influential study of Hindu religion and mythology, with particular reference to its visual illustrations.

INDO-EUROPEAN RELIGIONS

This entry consists of the following articles:

INDO-EUROPEAN RELIGIONS: AN OVERVIEW

The study of Indo-European religion has a relatively recent origin, for the very existence of the Indo-European language grouping was not recognized until a celebrated lecture given by Sir William (“Oriental”) Jones in 1786. Speaking to the Royal Asiatic Society of Bengal, Jones first observed that there were striking philological similarities between Greek, Latin, Sanskrit (the ancient language of India), and Persian, too numerous and precise to be explained by simple borrowing or chance. Going further, he suggested that the Celtic and Germanic languages exhibited many of the same features and argued that all of these geographically and historically far-flung languages were best understood as separate derivatives of a common parent language, a language nowhere preserved in written form, but which might be reconstructed through systematic comparison of the derivate stocks.

Later research has confirmed the relations among these languages, adding not only Germanic and Celtic firmly to the family now known as Indo-European but also Baltic, Slavic, Armenian, Albanian, Anatolian (chiefly Hittite), and Tokharian (an obscure language found in western China and Turkestan). Rigorous and systematic comparison of words in these various languages has permitted scholars to posit numerous prototypes as a means to explain the systematic resemblances that have been adduced. As a simple example of how this is done one might consider certain words for “god,” assembling a set of correspondences (to which other reflexes might be added) as shown in table 1.

From these correspondences, along with the knowledge of Indo-European phonetics gained from hundreds of other such comparisons, linguists can reconstruct a prototype **deywo-s* (the asterisk denotes a reconstructed form unattested in any written source), which means “god, deity.” Phonetic rules explain the various sound shifts in each language, but one must also note semantic changes in certain stocks, each of which is instructive for the history of the corresponding religion. Thus, for instance, the old word for “god” has become the most important word for demonic beings in Avestan (the Iranian language in which the most ancient Zoroastrian scriptures were composed), a transformation that seems to originate in the prophet Zarathushtra’s renunciation of the old Indo-Iranian pantheon.

The Greek reflex of **deywo-s* has also lost its sense as “deity,” being replaced in this usage by *theos*. The older term survives as an adjective, however, which reveals one of the fundamental attributes of deity in Indo-European thought: gods are celestial beings, characterized by light, for the word **deywo-s* (whence the Greek *dios*, “celestial”) is derived from a verb that means “to shine.” In contrast, one of the most important words for “human” identifies people as “terrestrial” beings (note the relation of the Latin *homo*, “man,” and *humus*, “soil”), while humans and deities are further contrast-

ed in other terminology that identifies them as “mortals” and “immortals” respectively.

This relatively simple example reveals some of the possibilities and some of the pitfalls of research into Indo-European religion. Careful examination of lexical items provides insight into the nature of thought on religious topics. But each of the separate Indo-European families differs from the other families in important regards, and just as Latin phonology differs from Iranian phonology for all that they are related (to cite but one example), so Roman religion is not identical to Iranian: a *deus* is not the same thing as a *daēva*.

Reconstruction that proceeds along linguistic lines is relatively safe, however, compared to research that seeks out correspondences in the myths, rituals, laws, cosmologies, and eschatologies of the various Indo-European peoples and that attempts to recover their hypothetical antecedents. Such research is possible, to be sure, but in all instances it is extremely risky and difficult, involving the adducement of parallel phenomena (usually called “correspondences” or “reflexes”) attested in the religions of several different Indo-European families; the study of each reflex in its cultural specificity; the isolation of those features that the scattered reflexes hold in common; the explanation of those features that diverge (often called “transformation”); and the positing of a hypothetical prototype that is capable of accounting for evident similarities, along with a train of historical development that explains the forces producing each transformation. Finally, the reconstructed prototype ought to be set within a plausible set of assumptions regarding the nature of Indo-European culture in general.

Based on linguistic and archaeological research, the ancient Indo-European peoples are generally considered to have been semisettled pastoralists, whose wealth consisted of relatively large herds, including domesticated sheep, pigs, goats, and, most important, cattle. Horses were also highly significant, especially when yoked to chariots and used in warfare, but cattle remained the normal draft animals for peaceful purposes, the source of most foods, and the fundamental measure of wealth. Some agriculture seems to have been practiced, although this was much less important and prestigious an activity than herding or war. The pursuit of warfare, especially the raiding of livestock from neighboring peoples, was facilitated not only by use of chariots but also by an elaborate weaponry built on a single metal, probably copper or bronze.

Linguistic data are insufficient to posit the existence of either a homeland or a proto-Indo-European community, and it is possible to view the similarity of the various Indo-European languages as the cumulative result of complex borrowings, influences, and cultural interrelations between multiple social and ethnic groups over many centuries. Some scholars have sought to employ archaeological evidence to demonstrate a specific point of origin for proto-Indo-European society. Of such theories, the most widely accepted

is that of Marija Gimbutas, who has delineated what she calls the Kurgan culture, dating to the middle of the fifth millennium BCE and located in the southern Russian steppes, in the area that stretches from the Urals to the land north of the Black Sea, and including such groups as the Jamna culture of the Ural-Volga region north of the Caspian and the Srednii Stog II culture north of the Black Sea.

MYTHIC LEGITIMATIONS OF SOCIETY, ECONOMY, AND POLITY. Comparison of texts in which are described the patterns of social organization among the Indian, Iranian, and Celtic peoples reveals a common structure, which is also preserved in the ideal republic envisioned by Plato. This system is characterized by the distinction of three hierarchically differentiated classes—or “functions,” as they are called by Georges Dumézil (1958), who was first to recognize their importance. Moreover, it is possible to reconstruct a number of myths that describe the origin of these classes, their nature, and their sometimes problematic interrelationships.

Most important of these is the creation myth, a complex, polyphonic story that told how the world was created when the first priest (often bearing the name Man, *Manu) offered his twin brother, the first king (often named Twin, *Yemo), in sacrifice, along with the first ox. From Twin’s body, the world was made, in both its material and social components. Portions of two reflexes of this myth may conveniently be cited: the first, from the Indic “Song of Purusa” (*Rgveda* 10.90.11–14) dates to about 900 BCE; the second, the Old Russian *Poem on the Dove King*, is mentioned in sources dating to the thirteenth century CE and was still circulating orally in the nineteenth century:

When they divided Purusa, how many pieces did they prepare?
 What was his mouth? What are his arms, thighs, and feet called?
 The priest was his mouth, the warrior was made from his arms;
 His thighs were the commoner, and the servant was born from his feet.
 The moon was born of his mind; of his eye, the sun was born;
 From his mouth, Indra and fire; from his breath, wind was born;
 From his navel there was the atmosphere; from his head, heaven was rolled together;
 From his feet, the earth; from his ears, the directions.

Our bright light comes from the Lord,
 The red sun from the face of God,
 The young shining moon from his breast,
 The bright dawn from the eyes of God,
 The sparkling stars from his vestments,
 The wild winds from the Holy Spirit.
 From this our little Tsars are on earth—
 From the holy head of Adam;
 From this princes and heroes come into being—
 From the holy bones of Adam;
 From this are the orthodox peasants—

Language	Phonetic Form	Semantic Sense
Latin	<i>deus</i>	“deity”
Lithuanian	<i>diēvas</i>	“deity”
Greek	<i>dios</i>	“celestial”
Hittite	<i>*šiuš</i>	“deity”
Sanskrit	<i>devāh</i>	“deity”
Avestan	<i>daēva</i>	“demon”

TABLE 1. Indo-European words for “God”

From the holy knee of Adam.

Although this article shall return to the cosmic dimensions of this myth, it is its social contents that are of concern now. Among these, the following four should be noted:

- (1) Society consists of vertically stratified classes, with priests or sovereigns in the first position, warriors in the second, and commoners—those entrusted with the bulk of productive labor—in the third. To these, a fourth class of relative outsiders—servants, or the like—was sometimes added, as in the Indian example cited above.
- (2) The characteristic activity of each of these classes is explained and chartered by the part of Twin’s body from which they originated. Thus, the intellectuals who direct society by exercise of thought and speech come from his head; those who defend society by their physical prowess come from his chest (heart) and arms; those who produce food, reproduce, and provide material support for the other classes come from the lower body, including belly, loins, legs, and feet.
- (3) The priest, following the model of Man, has as his prime responsibility the performance of sacrifice, sacrifice being the creative act *par excellence*.
- (4) The king, following the model of Twin, combines within himself the essence of all social classes and is expected to sacrifice himself for the good of the whole.

Another myth, which has as its central character the first warrior, whose name was Third (*Trito), provided an analysis of the warrior class. Within this story, it was related that cattle originally belonged to Indo-Europeans but were stolen by a monster, a three-headed serpent who was, moreover, specifically identified as a non-Indo-European. Following this theft, it fell to Third to recover the stolen cattle, and he began his quest by invoking the aid of a warrior deity to whom he offered libations of intoxicating drinks. Having won the god’s assistance, and himself fortified by the same intoxicant, Third set forth, found the serpent, slew him, and recovered the cattle, which had been imprisoned by the monster.

This myth, which is attested in more reflexes than any other (its traces are still apparent in countless fairy tales), speaks to the eternal themes of wealth and power. It asserts, first, that cattle—the means of production and of exchange in the most ancient Indo-European societies—rightly belong

exclusively to Indo-Europeans, falling into other hands only as the result of theft. Theft is condemned here because of its reliance on stealth and treachery, and it is set in contrast to raiding, which—far from being condemned—is heartily endorsed. Raiding emerges as a heroic action sanctioned by the gods, hedged with ritual, and devoted to regaining what rightfully belongs to the Indo-European warrior or his people. Throughout Indo-European history, Third in his various reflexes has remained the model for warriors, who repeatedly cast themselves in his image—raiding, plundering, and killing their non-Indo-European neighbors, convinced all the while that they were engaged in a sacred and rightful activity.

Yet another myth emphasized the importance of the commoner class to the social totality, although no individual heroic figure was provided as a model for commoners. Rather, the myth begins with separation and even hostility existing between the generalized representatives of the upper classes and those of the commoners. After an inconclusive struggle, however, members of all classes recognize their need for one another, and they merge into a larger, all-encompassing society. Thereafter the classes are expected to cooperate and live harmoniously, although the commoners continue to occupy a subordinate position, a considerable portion of their labor being diverted for the support of the noble classes of priests, warriors, and kings. At the level of mythic ideology, however, if not of actual social process, commoners were assured of their superiority to even the most privileged members of society, for an important set of myths, recently studied by Cristiano Grottanelli, focused on the conflict of a humble woman who was the mother of twins (thus signifying abundant reproductive power) with a king's horses (the emblem of martial and royal power), in which the lowly woman emerged victorious.

COSMOLOGY AND THE GODS. While Georges Dumézil and his followers have consistently argued that the Indo-European pantheon mirrored the organization of social classes, other scholars have at times been skeptical of this view. Chief among its difficulties is the fact that Dumézil's proposals include none of the gods for whom names can be linguistically reconstructed, all of whom are personified natural phenomena—Shining Sky (*Dyeus), Sun (*Swel), Dawn (*Ausos), and so forth—while reconstructible names exist for none of the deities he proposes.

In general, as noted above, deities were characterized as radiant celestial beings. In addition to the **deywo-s*, however, there was another class of divinities associated with the waters beneath the earth's surface and with darkness. These deities—whose names were regularly formed with the preposition signifying downward motion (**ne-*, as in Latin *Neptunus*, Greek *Nēreus*, Germanic *Nerthus*, Sanskrit *Nirṛti*)—figure in myths that are nothing so much as meditations on the interconnections between “above” and “below,” involving immersion into and emersion out of the world ocean, as has recently been demonstrated by Françoise Bader.

Speculation on the nature of the cosmos also forms an important part of the creation myth, the social contents of which was touched on above. It must be noted, however, that beyond this social discourse, the myth established a series of homologic relations between parts of the human body and parts of the physical universe—that is to say, an extended parallelism and consubstantiality was posited between the microcosm and the macrocosm. Many texts thus tell of the origin of the sun from the eyes of the first sacrificial victim, stones from his bones, earth from his flesh, wind from his breath, and so forth, while others invert the account—as for instance, in the following medieval accounts, the first Germanic and the second Slavic:

God made the first man, that was Adam, from eight transformations: the bone from the stone, the flesh from the earth, the blood from the water, the heart from the wind, the thoughts from the clouds, the sweat from the dew, the locks of hair from the grass, the eyes from the sun, and he blew in the holy breath. (from the Old Frisian *Code of Emsig*)

And thus God made man's body out of eight parts. The first part is of the earth, which is the lowliest of all parts. The second is of the sea, which is blood and wisdom. The third is of the sun, which is beauty and eyes for him. The fourth is of the celestial clouds, which are thought and weakness. The fifth is of the wind—that is, air—which is breath and envy. The sixth is of stones, that is, firmness. The seventh is of the light of this world which is made into flesh, that is humility and sweetness. The eighth part is of the Holy Spirit, placed in men for all that is good, full of zeal—that is the foremost part. (from the Old Russian *Discourse of the Three Saints*)

In these and other texts the elements of the physical universe are converted into the constituent parts of a human body, as cosmogony (a story of the creation of the cosmos) becomes anthropogony (a story of the creation of humankind). In truth, cosmogony and anthropogony were regarded as separate moments in one continuous process of creation, in which physical matter eternally alternates between microcosmic and macrocosmic modes of existence. Bones thus become stones and stones become bones over and over again, matter and change both being eternal, while the body and the universe are only transient forms, alternate shapes of one another.

RITUAL ACTION. The myths that have been under consideration were closely correlated with and regularly represented in numerous ritual forms. Thus, the creation myth was inextricably connected to sacrifice, the most important of all Indo-European rites. Insofar as the first priest created the world through the performance of a sacrifice in which a man and an ox were the victims, so each subsequent priest recreated the cosmos by sacrificing humans or cattle. This was accomplished through manipulation of the homologies of macrocosm and microcosm, such that when the victim was dismembered, its material substance was transformed into the corresponding parts of the universe. Thus, for example,

an Indic manual of ritual practice, the *Aitareya Brāhmaṇa* (2.6), provides instructions for the sacrificial dismemberment of an animal victim in terms drawn directly from the creation myth:

Lay his feet down to the north. Cause his eye to go to the sun. Send forth his breath to the wind, his life-force to the atmosphere, his ears to the cardinal points, his flesh to the earth. Thus, the priest places the victim in these worlds.

Without this matter drawn from the bodies of sacrificial victims all the items of the material world—earth, stones, sun, wind, water, and the like—would become depleted; it is only because they are replenished in sacrifice that the cosmos continues to exist.

If sacrifice is thus a sort of “healing” of the cosmos based on principles articulated in the creation myth, medical practice was also based on the same principles and bears a curious relation to sacrifice. For if in sacrifice the priest shifted matter from the body to the universe, then in the healing of a broken limb—as attested in the famous Second Merseberg Charm and corresponding materials throughout the Indo-European world—the healer took matter from the universe and restored it to a broken body, creating new flesh, bones, blood, and the like out of earth, stones, and water.

Royal investiture was based on yet another elaboration of ideas contained within the creation myth, as is suggested by the researches of Daniel Dubuisson. Investigating accounts of ancient “coronation” rituals in Ireland and India, he has shown that a king was ritually constructed by having the essential properties of the three Indo-European social classes placed within his body, symbolic gifts, clothing, unctious, and the like being employed toward this end.

Other rituals were closely related to the myth of Third. Embarking on cattle raids—which were raised to the status of a sacred act as a result of this mythic charter—Indo-European warriors invoked the assistance of martial deities, poured libations, partook of intoxicating drinks, and aspired to states of ecstatic frenzy. Moreover, each young warrior had to pass through certain initiatory rituals before he attained full status as a member of the warrior class. Regularly his first cattle raid was something of a rite of passage for the young warrior, and other initiations were consciously structured on the myth of Third and the serpent. It appears that in some of these, a monstrous tricephalous dummy was constructed, and the initiand was forced to attack it. If able to summon up the necessary courage to do so, he discovered that his seemingly awesome opponent was only a joke, with the implicit lesson that all of his future enemies, however fearsome they might seem, would be no more formidable than this dummy. Those enemies, of course, were to be cast in the role of the serpent—a monster, a thief, and, what is most important, an alien (i.e., a non-Indo-European)—the plunder and murder of whom was established by myth as not only a rightful but also a sacred act.

While the use of intoxicants was an important part of warrior ritual, these had other applications as well. The oldest Indo-European intoxicating beverage was mead, later followed by beer, wine, and a pressed drink known as *soma* to the Indians and *haoma* to the Iranians; the symbolism and ideology surrounding all of these remained relatively constant. In all instances, the drink appears as a heightener of abilities and activities. When consumed by a priest, it increases his powers of vision and insight. Similarly, it makes a poet more eloquent, a warrior more powerful, a king more generous and just.

A large group of rituals served to forge bonds of community and to cement important social relations. Extremely important in this regard were certain formalized reciprocal obligations, including hospitality and gift exchange, whereby individuals, lineages, and even larger units were brought into repeated contact and friendly interchange. Marriage also must be considered as a prolonged exchange relationship between social groups, given the predominant preference for exogamy. An individual marriage was thus as much a part of an ongoing exchange between lineages or clans as it was a permanent bond between two individuals.

Verbal rituals—including those of vow, oath, and treaty—played a highly important part in the establishment and preservation of social bonds; accordingly, truth and fidelity were cardinal virtues. Initially, this must be related to the lack of literacy among the most ancient Indo-European peoples, a state of affairs that also contributed to the high development of verbal art (epic poetry, for instance) and mnemonic techniques. But even after the introduction of writing among the scattered Indo-European peoples, a marked preference for the oral transmission of religious lore remained, for the spoken word was perceived as a live vehicle, in contrast to the dead written letter, and was preferred accordingly.

If verbal rituals could serve to establish social connectedness, they could also be used to sunder unwanted connections, as is attested in a formula of outlawry that survives in Hittite and Germanic reflexes, the former dating to 1600 BCE. Here, particularly disreputable individuals (an abductor and murderer in the first instance, a grave robber in the second) are told “You have become a wolf” and “May he be a wolf” respectively, the wolf being the most feared predator of pastoral societies, a dangerous outsider ever to be kept at bay. Ironically, however, it was not only outlaws who were regarded as wolves, for Indo-European warriors also styled themselves wolflike beings, as is attested by the many ethnic names derived from the word for “wolf” (thus the Luvians, Lykians, Hirpini, Luceres, Dacii, Hyrcanii, and Saka Haurmavarka), personal names so formed (Wolfram, Wolfhart, Wolfgang), and the Greek term *lussa* (“rabies, wolfish rage”), which denotes the highest pitch of fury attained by heroes such as Achilles and Hector in the *Iliad*. Apparently what legitimated the wolfish violence of these heroes is that it was directed outside the community of Indo-Europeans, in con-

trast to that of outlaws, which was directed internally, an inference that is supported by the fascinating name of a heroic warrior attested in the *R̥gveda*: Dasyave Vṛka, “wolf to the Dasyu,” that is, to the non-Indo-European.

DEATH, RESURRECTION, AND ESCHATOLOGY. A central issue in Indo-European religions, as in most religions, was what becomes of an individual after death. Although several scholars have devoted attention to certain details of funerary ideology, the full nature of Indo-European thought on this topic remains to be worked out. Among the major contributions thus far are the studies of Hermann Güntert (1919), who showed that there was a goddess *Kolyo (“the coverer”) whose physical form incarnated the mixture of fascination and horror evoked by death, for she was seductively beautiful when seen from the front, while hiding a back that was repulsive—moldy and worm-eaten—in the extreme. Paul Thieme (1952) has also contributed an important study of the view of death as a reunion with departed ancestors, and Kuno Meyer (1919) has shown that in Ireland as in India it was the first mortal (*Yemo, the twin) who founded the other-world.

If ideas regarding the fate of the soul are unclear—no reconstructible word approximates the semantic range of the English *soul*, the nearest equivalent being a term for “life-breath”—those on the fate of the body are extremely precise and reveal a remarkable religious content. For death is seen as the last sacrifice that an individual can offer, in which his or her own body is itself the offering. Moreover, that body is transformed into the elements of the physical universe, just as were those of Twin at the time of creation, each death being not only a sacrifice but a representation of the cosmogonic sacrifice. Such a view is preserved, for instance, in Euripides’ *The Suppliant Women*:

Let the corpses now be covered with the earth,
From which each of them came forth to the light
Only to go back thither: breath to the air
And body to earth. (531–534)

Or in the funeral hymn of the *R̥gveda*:

Your eye must go to the sun. Your soul must go to the
wind. You must go to the sky and the earth, according
to what is right.
Go to the waters, if you are placed there. You must
establish the plants with your flesh. (10.16.3)

This is not a final fate, however, for it would seem that nothing within the cosmos was perceived as final. Just as cosmogony was seen to alternate with anthropogony, so also death and resurrection. That matter that assumes its cosmic form when one specific human body dies will once again assume bodily form when that specific cosmos itself dies, as must inevitably happen. Greek, Germanic, and Indo-Iranian evidence permits reconstruction of a temporal scheme involving four world ages, the first of which is most pure and stable, followed by ages in which human virtue and the very order of the cosmos gradually break down. At the end of the fourth

world age, there is an apocalyptic collapse, followed by the creation of a new, pure, and regenerated world. One of the cardinal features of the eschatological destruction of the cosmos, however, is the resurrection of the dead, their bodies being formed out of the material substance freed when the cosmos falls apart. The new creation that follows is then in most versions accomplished with an initial act of sacrifice. Descriptions of the resurrection are preserved, *inter alia*, in the *Pahlavi Rivāyat Accompanying the Dādistān i dīnīg*, a Zoroastrian text of the ninth century CE, and in Plato’s *Politicus*:

[In order to accomplish the resurrection] Ohrmazd summons the bone from the earth, the blood from the water, the hair from the plants, and the life from the wind. He mixes one with the other, and in this manner, he keeps on creating. (*Pahlavi Rivāyat* 48.98–107)

When the transition of the old people to the nature of a child is completed, it follows that those lying [dead] in the earth are put back together there and brought back to life, the process of birth being reversed with the reversal of the world’s rotation. (*Politicus* 271b)

Behind these formulations stand several very simple, yet very profound, principles: (1) matter is indestructible; (2) matter is infinitely transmutable; (3) living organisms and the physical universe are composed of one and the same material substance; (4) time is eternal. While change is thus constant, it is also meaningless, for nothing that is essentially real is ever created or destroyed. Worlds come and go, as do individuals of whatever species, but being—material being—is always there.

The gods are also subject to the same rhythms of dissolution and reemergence, but in truth the gods seem to have been of much less concern than mythic ancestors such as Man, Twin, and Third. Certain statements made above, however, must be corrected in light of what has just been said about the nature of time and the cycles of creation and destruction. For whereas this article initially called these figures the “first” king, priest, and warrior respectively, it must now be concluded that they were merely the first of the current world age, time and the world receding infinitely into the past as well as stretching eternally into the future.

BIBLIOGRAPHY

Among the most interesting and important general studies of Indo-European religion are (in chronological order): Joseph Vendryes’s “Les correspondances de vocabulaire entre l’indo-iranien et l’italo-celtique,” *Mémoires de la Société de Linguistique de Paris* 20 (1918): 265–285; Hermann Güntert’s *Der arische Weltkönig und Heiland* (Halle, 1923); Paul Thieme’s *Mitra and Aryaman* (New Haven, 1957); Georges Dumézil’s *L’idéologie tripartite des Indo-Européens* (Brussels, 1958); Émile Benveniste’s *Indo-European Language and Society*, translated by Elizabeth Palmer (Coral Gables, Fla., 1975); Franco Crevatin’s *Ricerche d’antichità indoeuropee* (Trieste, 1979); and my own *Priests, Warriors, and Cattle: A Study in the Ecology of Religions* (Berkeley, Calif., 1981).

Specialized studies of particular merit are Marija Gimbutas’s numerous articles on the archaeological record of the Indo-

Europeans, most complete of which to date is "An Archaeologist's View of PIE in 1975," *Journal of Indo-European Studies* 2 (Fall 1974): 289–308; Georges Dumézil's three-volume *Mythe et épopée* (Paris, 1968–1973), in which he demonstrates the ways in which many myths were transformed into epic, pseudohistory, and other genres; Stig Wikander's *Der arische Männerbund* (Lund, 1938) and Lily Weiser's *Altgermanische Jünglingsweihen und Männerbunde* (Baden, 1927) on warriors; Wilhelm Koppers's "Pferdeopfer und Pferdekult der Indogermanen," *Wiener Beiträge zur Kulturgeschichte und Linguistik* 4 (1936): 279–411, and Kasten Rönnow's "Zagreus och Dionysos," *Religion och Bibel* 2 (1943): 14–48, on sacrifice (both to be used with caution, however); Daniel Dubuisson's "Le roi indo-européen et la synthèse des trois fonctions," *Annales économies sociétés civilisations* 33 (January–February 1978): 21–34, on kingship; Hermann Güntert's *Kalypso* (Halle, 1919); Kuno Meyer, "Der irische Totengott und die Toteninsel," *Sitzungsberichte der preussischen Akademie der Wissenschaften* (1919): 537–546; and Paul Thieme's *Studien zur indogermanischen Wortkunde und Religionsgeschichte* (Berlin, 1952) on death and the otherworld; and my own *Myth, Cosmos, and Society: Indo-European Themes of Creation and Destruction* (Cambridge, Mass., 1986) on the creation myth.

Two papers presented at a panel on Indo-European religion held during the Ninth International Congress of Anthropological and Ethnographic Sciences (Vancouver, 1983) were of considerable importance: Françoise Bader's "Une mythe indo-européenne de l'immersion-émergence" and Cristiano Grottanelli's "Yoked Horses, Twins, and the Powerful Lady: India, Greece, Ireland and Elsewhere."

On the problems and insecurities of research in this area in general, see Ulf Drablin, "Indogermanische Religion und Kultur? Eine Analyse des Begriffes Indogermanisch," *Temenos* 16 (1980): 26–38; Jean-Paul Demoule, "Les Indo-Européens ont-ils existé?" *L'histoire* 28 (1980): 108–120; and Bernfried Schlerath, "Ist ein Raum/Zeit Modell für eine rekonstruierte Sprach möglich?" *Zeitschrift für vergleichende Sprachwissenschaft* 95 (1981): 175–202.

BRUCE LINCOLN (1987)
Revised Bibliography

INDO-EUROPEAN RELIGIONS: HISTORY OF STUDY

Strictly speaking, the history of comparative Indo-European studies begins in the late eighteenth century as a direct result of the momentous discovery that the ancient languages now classified as "Indo-European" (e.g., Latin, classical Greek, Sanskrit, Old English, Old Persian, Old Icelandic, Old Church Slavonic, Old Irish, Hittite, etc.) all stemmed ultimately from a common source, that is, Proto-Indo-European. As shall be seen, it soon became apparent that the speakers of these languages, which can be considered along with their progeny as members of a grand "family" of languages, shared more than simply a common linguistic heritage, and that among the most important features of this extralinguistic, Indo-European heritage was a common body of religious beliefs and practices.

To be sure, the taproots of the discipline can be traced back to classical antiquity, to the theories of Euhemerus (fl. 300 BCE) and other Greek and Roman scholars who attempted to come to grips with the origin and meaning of myth. It is also possible to trace the immediate source of the ideas that flowered in the nineteenth century to the ideas of such eighteenth-century precursors as Bernard de Fontenelle (1657–1757), Giovanni Battista Vico (1668–1744), and Charles de Brosses (1709–1777), who first suggested that a search for natural metaphors might be preferable to the traditional euhemeristic and allegorical approaches that had heretofore been the rule. These ideas may also be traced as well to that curious (albeit all-pervasive) philosophical, literary, and artistic movement called Romanticism, adumbrated in the works of J. G. Herder (1744–1803), which profoundly influenced most of the scholars who first began to conceive of a distinctly Indo-European religious tradition in the early nineteenth century. But these ideas belong properly to the general history of comparative mythology and religion; for the purposes of this article, the survey begins with the discovery of the Indo-European language family.

DISCOVERY OF THE INDO-EUROPEAN LANGUAGE FAMILY.

Until the last quarter of the eighteenth century, most theories about the nature and origin of language were grounded in philosophical speculation, much of it centering on the idea of degeneration. Thus, the primordial language was often held to be Hebrew, since it must have been spoken in the Garden of Eden. Following the ancient notion of degeneration from an assumed "Golden Age," many writers on the subject maintained that Greek was a degenerate form of Hebrew, Latin a degenerate form of Greek, and that the modern languages of Europe were all degenerate offspring of Latin.

However, thanks to the voyages of discovery and the rapid expansion in European awareness of the range and diversity of human languages, and impelled by the romantic emphasis on national origins, which effectively precluded the notion that all languages were necessarily descended from Hebrew, scholars had begun to suspect that the degeneration hypothesis, whether secular or religious, was inadequate to

explain the historical relationships among languages. Nowhere was this more obvious than in India, which, by the latter part of the eighteenth century, had become in effect the private preserve of the British East India Company. As European awareness of this vastly complex region deepened, it became clear that Sanskrit, the ancient language of the Hindu sacred texts, occupied a position in religious and literary affairs similar to that occupied by Latin in Europe during the Middle Ages. Indeed, several scholars, beginning with Filippo Sassetti in 1600, had remarked on the curious similarities between Latin and Sanskrit, but these similarities defied explanation in terms of the “degeneration hypothesis,” as Sanskrit was patently as ancient as either Latin or classical Greek. Furthermore, the modern languages of North India—Hindi, Bengali, and the rest—seemed to bear the same immediate relationship to Sanskrit as French, Spanish, Italian and other members of what later came to be called the Romance languages did to Latin.

The problem was finally solved in 1786 by William Jones (1746–1794), who is generally considered the founder of scientific linguistics. An amateur philologist (he was reputed to have been fluent in some twenty-two languages), Jones had recently been appointed chief justice of the East India Company’s establishment at Calcutta, and in his off-hours he immediately set about learning Sanskrit. In September 1786, at a meeting of the Royal Asiatic Society of Bengal, he gave an after-dinner speech in which, for the first time, the idea of the language family was first clearly articulated. As Jones saw it, the relationship among Sanskrit and the ancient languages of Greece and Rome, as well as those spoken by the ancient Germans and Iranians, was that of a set of orphaned siblings: all were descended from a common parent language that had long since disappeared. That parent language, however, might be reconstructed by rigorously comparing the grammars and lexicons of these attested languages. The whole ensemble could be described as a family tree, one to which Hebrew, Arabic, and other Semitic languages did not belong, for they were members of another, wholly distinct language family.

Thus was born both comparative philology and the idea of the Indo-European language family. Although Jones himself never followed up his monumental discovery, others soon did, and by the beginning of the third decade of the next century the science of comparative philology, together with the discipline now referred to as comparative Indo-European religious studies, was well under way.

Almost from the outset, the practitioners of this new science, almost all of them steeped in romantic idealism, found themselves confronted by more than simply a set of linguistic similarities. The primary source materials—the *Rgveda*, the *Mahābhārata*, the *Iliad*, the Iranian Avesta, the Icelandic Eddas, and so forth—were religious and/or mythological texts, and it soon became apparent that the gods, heroes, rituals, and events described in these texts could be compared using the same basic methodology that Jones and others had

developed, that is, the *comparative method*, which is predicated on the assumption that anterior stages and/or prototypes can be systematically reconstructed from attested evidence, linguistic or otherwise. Thus, comparative mythology, and especially comparative Indo-European mythology, rapidly took its place as a sister discipline of comparative philology.

EARLY NINETEENTH CENTURY. As might be expected, many early nineteenth-century scholars, even those who were not directly concerned with Indo-European linguistic studies, had something to say about various aspects of the newly discovered parallels among the several Indo-European pantheons. This was especially true in Germany, where romantic concern with the origins of the *Volk* (German and otherwise) had become almost a national passion. Thus, Karl O. Müller (1797–1840) and G. F. Creuzer (1771–1858) drew heavily, albeit selectively, upon the linguistic evidence in their attempts to reconstruct the prototypes of Greek and other Indo-European gods and heroes. Even the philosopher G. W. F. Hegel (1770–1831), in whose works Romantic idealism reached the apex of its development, seems to have been strongly influenced by the new comparativism, and, as Richard Chase puts it, “longed for a ‘polytheism in art’ and imagination, a plastic and mythological philosophy” (*Quest for Myth*, 1949, p. 39).

Most of the pioneer philologists, among them Franz Bopp (1791–1867), Friedrich Schlegel (1772–1829), and Rasmus Rask (1787–1832), also made important contributions to comparative Indo-European mythological and religious studies. In many respects, the most distinguished member of this group was Jacob Grimm (1785–1863), who, with his brother Wilhelm (1786–1859), was responsible for amassing the great collection of tales that bears their name. However, Jacob Grimm was more than a mere collector of folk tales; he was also a preeminent philologist, and in 1823 he articulated the principle that later came to be known as “Grimm’s law,” which firmly established the phonological connections among Latin, Greek, and the ancient Germanic languages. His most important single contribution to Indo-European religious studies was a two-volume work entitled *Deutsche Mythologie* (1835). In it he developed the thesis that the *Märchen* he and his brother had collected were the detritus of pre-Christian Germanic mythology. This argument is bolstered by a host of etymologies, as well as comparisons to other Indo-European traditions. A good example of the latter is Grimm’s suggestion that the ancient Scandinavian account of a war between the gods (Óðinn, Vili, and Vé) and an earlier generation of giants (Ymir et al.) is cognate to the Greek Titanomachy, or the war between the Olympians and the Titans (that is, between Zeus and his siblings and the supernatural beings of the previous generation, led by Kronos).

Elsewhere in Europe and in America interest in mythology, if not exclusively Indo-European mythology, also ran high. In Britain, for example, most of the Romantic poets—Wordsworth, Coleridge, Blake, Shelley, Keats, Byron, and others—drew extensively upon mythological themes; and

Thomas Bulfinch's *The Age of Fable* (1855) popularized the study of mythology like no other work before it. Thus, by the middle of the nineteenth century, the science of comparative philology had reached maturity, interest in mythology and the history of religions had become widespread, and the stage was set for the appearance of the first grand paradigm in the history of Indo-European religious studies.

THE FIRST GRAND PARADIGM: F. MAX MÜLLER AND THE NATURISTS. In his seminal book, *The Structure of Scientific Revolutions* (1970), the eminent philosopher of science Thomas S. Kuhn makes a persuasive case for the proposition that all scientific knowledge expands in what amounts to an ascending and ever-widening spiral. In its earliest stages a new discipline necessarily finds itself groping for a central focus, for an overarching model in terms of which theories can be generated. Eventually, however, thanks to the efforts of a few scholars, a breakthrough is made, and there emerges a grand paradigm, which not only organizes the knowledge heretofore gained, but by its very nature generates a host of new discoveries and/or interpretations. The emergence of such a paradigm is revolutionary in its impact, and constitutes a quantum leap forward in the history of a discipline.

Kuhn, of course, focuses his attention upon the growth of the physical sciences, which so far have known at least two grand paradigms—Newtonian mechanics and quantum mechanics/relativity—and which may well be on the verge of a third. But the model applies generally. For example, in the history of linguistics, William Jones's discovery led to that discipline's first grand paradigm, which indeed precipitated the study of Indo-European religions. However, it was not until the 1850s, almost sixty years after Jones's death, that Indo-European religious studies finally achieved its own grand paradigm.

The person most responsible for this "revolution" was F. Max Müller (1823–1900), a German-born Sanskrit scholar, philologist, and student of Indian religions who had studied with Bopp and the eminent French Sanskritist Eugène Burnouf. Shortly after completing his formal studies, Müller accepted a position at Oxford University as a lecturer in Sanskrit and Indian religions; as it turned out, he spent the rest of his career there, eventually becoming one of the Victorian era's most distinguished men of letters.

In 1856, seven years after arriving at Oxford, Müller published a long essay entitled simply "Comparative Mythology" (published in *Oxford Essays*, 1856), and the revolution was launched. Although he went on to publish a veritable library of books, as well as innumerable collections of essays, articles, introductions, and so forth, most of his basic ideas were laid out in "Comparative Mythology."

Solar mythology and the "disease of language." First and foremost among Müller's ideas was the notion that the gods and heroes of the "Aryan" (i.e., Indo-European) peoples were basically metaphors for the sun, in all its aspects. To be sure, this was not a brand-new idea. In 1795, Charles-

François Dupuis (1742–1809) had suggested that Jesus Christ was a solar metaphor and that the twelve apostles could be interpreted as the signs of the zodiac. But it was Müller who escalated the notion into a full-blown paradigm, one that had special relevance to the ancient Indo-European-speaking domain. Moreover, as a philologist, Müller insisted that the key to understanding these solar metaphors lay in the etymologies of divine names.

Müller asserted that language, including Proto-Indo-European, which he identified in effect with the earliest form of Sanskrit, was in its pristine state eminently rational. Objects such as the sun, the moon, stars, and other natural phenomena were labeled without reference to any divine beings or concepts, as the earliest dialects were incapable of expressing abstractions. But as time went on, Müller concluded, a curious malady set in, a "disease of language," the prime symptom of which was metaphor. What had begun as simple, descriptive terms gradually evolved into increasingly complex and abstract metaphors, and these in turn came to take on a life of their own. In short, by the time the earliest religious texts (e.g., the *Rgveda* and Hesiod's *Theogony*) were composed, the disease of language had become terminal; myth and religion had replaced reason and rationality. By judicious use of the comparative method, however, one could cut through the layers of metaphoric accretion and arrive at the root meanings underlying divine and heroic names. Thus, for example, the equation between Zeus and the Indian figure Dyauh, which clearly stemmed from a Proto-Indo-European conception of the sky god, could be traced back to a series of abstract conceptions relating to light, brightness, dawn, and so on, which, in turn, ultimately derived from metaphors for various solar attributes. Although he admitted that other natural phenomena play a part in generating mythical metaphors, Müller constantly emphasized the sun as the prime source of Indo-European religious inspiration: "I am bound to say that my own researches have led me again and again to the dawn and the sun as the chief burden of the myths of the Aryan race" (*Lectures on the Science of Language*, 1864, p. 520).

Müller's solar mythology rapidly began to gain adherents, both in Great Britain and abroad. Perhaps the most important of these was the English classicist George W. Cox (1827–1902), author of *The Mythology of the Aryan Nations* (1887). Despite his obsession with "pan-Aryanism" and with solar and other natural metaphors, Cox added a new and important dimension to comparative Indo-European mythology through his emphasis upon structural as well as etymological equations. As shall be seen, this prefigured more recent theories about the nature of the Indo-European religious tradition. Another major disciple was the Semitist Robert Brown (b. 1844), who extended the paradigm far beyond the Indo-European domain and used it to explain the ancient Near Eastern divinities as well as those of the *Rgveda*. Two American scholars, John Fiske (1842–1901) and Daniel G. Brinton (1837–1899), also made significant contributions to

the literature of solar mythology. In *Myths and Mythmakers* (1888) Fiske attempted to reconcile the meteorological and solar varieties of naturism, and Brinton, in *The Myths of the New World* (3d ed., 1896), sought to demonstrate the parallels between North American Indian and Indo-European mythological figures.

It should be pointed out that Müller's was by no means the only naturistic school of comparative Indo-European mythology to flourish in the late nineteenth century. Indeed, the "first paradigm," as it has been termed here, actually included several rather distinct subparadigms, all of which shared essentially the same methodology and basic assumptions. For example, in 1859 Adalbert Kuhn (1812–1881) published his famous *Die Herabkunft des Feuers und des Göttertranks*, in which thunderstorms and their attendant bolts of lightning, rather than the sun, were conceived to be the prime source of Indo-European (and other) mythological and religious metaphors. Kuhn's most famous onomastic equation, later shown to be totally incorrect, was the assumed etymological connection between Prometheus and the Indian figure Pramantha. Both were seen as archetypal "fire bringers," and Kuhn and his followers were as assiduous in discovering other Indo-European fire gods as Müller and others were in discovering their solar divinities. Another prominent naturist was the Italian philologist Angelo de Gubernatis (1840–1913), who emphasized animal metaphors; thus, where Müller and Kuhn saw the sun and the lightning bolt, Gubernatis saw wild beasts, especially beasts of prey. Still others sought to find lunar and/or stellar metaphors in the Indo-European and other ancient mythological traditions.

Collapse of the first paradigm. While Müller, Kuhn, Cox, and the rest were developing their naturistic models, another scholarly approach to myth and religion per se was quietly taking a shape that would ultimately prove to be the undoing of these models. This approach was fostered by the pioneer anthropologists, such as E. B. Tylor (1832–1917), John Lubbock (1834–1913), and John McLennan (1827–1881), who, as might be expected, came to focus their attention not on the Indo-European tradition, but rather on the vast corpus of data that had come to light relative to the beliefs and practices of contemporary "primitive" peoples. In his *Primitive Culture* (1871), for example, Tylor laid the foundations for the theory of animism, that is, the notion that all religious beliefs are rooted in the concept of the human soul. The anthropologists were for the most part not trained philologists—although they did, of course, make use of the comparative method in its broadest sense—and therefore were not as attuned to etymologies and the metaphoric significance of names. The result was a profoundly different conception of the origin and evolution of human religious beliefs.

By the late 1880s the naturists and the anthropologists found themselves on a collision course. The anthropological attack was led by a brilliant and iconoclastic Scotsman, An-

drew Lang (1844–1912). A sometime disciple of Tylor, Lang set about to destroy naturism in general and the theories of Max Müller in particular. In a series of books, essays, and popular articles he hammered at Müller's assumptions and etymologies, and by the end of the century had effectively demonstrated the weaknesses in the naturistic paradigm so effectively that it did not long survive the death of its chief proponent in 1900.

It would be impossible here to trace all of the thrusts and counterthrusts that marked this famous scholarly debate, but Lang's principal objections can be summed up as follows: (1) Müller's theory—and, by extension, the theories of Kuhn, Cox, Fiske, and the rest—was implicitly based on the fallacious linkage of "degradation" to Original Sin, which, although the chosen people in this instance were the so-called Aryans (i.e., Indo-Europeans) rather than the Jews, was modeled on traditional Judeo-Christian historiography and did not take into account the comparative data from contemporary non-Western cultures; (2) too much emphasis was placed upon language and linguistic processes, especially metaphor and etymology, and too little on the differential effects of the social, cultural, and physical setting wherein myths and religious concepts originated; and (3) there was too much concern with origins and not enough with the historical development of myths and mythmaking, nor was enough attention paid to the universal, evolutionary stages evident in the Indo-European tradition. Needless to say, Müller attempted to answer these charges as best he could, and indeed his criticisms of unilineal evolutionism are remarkably similar to those of later critics. But in the end Lang was triumphant, and solar mythology, together with the other varieties of naturism that had flourished since the middle of the century, went into a permanent eclipse.

EMPIRICAL REACTION AND EMERGENCE OF NEW MODELS: 1900–1920. Thus passed the first grand paradigm in comparative Indo-European religious studies. As the new century dawned, the majority of scholars working in the field—classicists, Indologists, Germanists, Celticists, and so forth—rapidly abandoned the naturistic/etymological approach in favor of more intense efforts to explain the various Indo-European religious traditions on their own terms. As in other disciplines at this time, including anthropology, a new spirit of empiricism came to the fore, marked by a growing distrust of comparativism. Most of these specialists, as they may be termed (e.g., the Celticist Joseph Vendryes), relied heavily on the methods of textual criticism, phrasing their analyses in terms of new translations, new specific etymologies, and the like. Indeed, save for the purposes of linguistic reconstruction, the idea of a common Indo-European religious and/or mythological heritage was rarely mentioned in the first two decades of the twentieth century.

At the same time, unrelated, for the most part, to Indo-European studies, several new theoretical models for the study of religion emerged, two of which were to have an important impact on the future development of this discipline.

In his massive survey of primitive religion, *The Golden Bough* (3d ed., 12 vols., 1911–1915), James G. Frazer (1854–1941) came to the conclusion that religion everywhere was rooted in magic, and that all belief systems, including those of the ancient Indo-European-speaking communities, were predicated on a sacrificial ritual wherein a god was killed and replaced so as to renew the world. Among Frazer's prime examples was the death of Baldr, the Apollo-like son of the chief Norse god, Óðinn, who, thanks to the machinations of Loki, was unintentionally killed at the peak of his youthful vigor by his sibling, the blind god Høðr. Thus, through a form of "sympathetic magic" the gods, and the forces they incarnated, were periodically manipulated so as to keep them perpetually vigorous and fertile. Although largely rejected by subsequent generations of anthropologists, Frazer's influence lingered on in the so-called ritualist school of mythology associated with Jane E. Harrison, Francis M. Cornford, Jessie L. Weston, Gilbert Murray, F. R. S. Raglan, and H. J. Rose, all of whom drew heavily on Greco-Roman beliefs and practices in the formulation of their theories (indeed, most were classicists by academic training).

A second theoretical development occurred in France under the aegis of Émile Durkheim (1858–1917), one of the founding fathers of contemporary social science. In 1903, in collaboration with his principal student and disciple, Marcel Mauss (1872–1950), Durkheim published a short monograph entitled "De quelques formes primitives de classification: Contribution à l'étude des représentations collectives" (*Année sociologique* 6, 1903, pp. 1–72), which argued that social classification systems are necessarily "collectively represented" in a society's belief systems. This was followed in 1912 by his *magnum opus*, *Les formes élémentaires de la vie religieuse* (translated as *The Elementary Forms of the Religious Life*, 1917), in which he persuasively demonstrated that society itself is the stuff of the divine and that humans necessarily fashion their gods as collective representations of fundamental "social facts." To be sure, Durkheim's prime examples were drawn from the belief systems of the Australian Aborigines, but the implications for the study of religion per se were clear: a new primary source of religious metaphors had been identified, and the immediate implications for the study of Indo-European belief systems were also clearly present from the outset, as Durkheim's ideas themselves were in some measure influenced by the demonstration (1907) of Antoine Meillet (1866–1936) that the Iranian god Mithra (equivalent to the Vedic god Mitra) was the personification of the idea of "contract." Indeed, as shall shortly be demonstrated, Meillet, perhaps the most eminent Indo-European philologist of his time, had more than a little to do with the development of the second grand paradigm in Indo-European studies.

NEO-COMPARATIVISTS AND THE SEARCH FOR A NEW PARADIGM: 1920–1938. Although comparative Indo-European religious studies suffered a marked decline in the generation following Müller's death, the basic questions he and his colleagues had addressed regarding the fundamental similarities

among the several ancient Indo-European pantheons remained, and in the early 1920s the pendulum began to swing once again in the direction of what can best be labeled neo-comparativism. For example, Albert Carnoy began to speak in no uncertain terms about a "religion indo-européenne," and shortly thereafter, although they differed widely in inspirations and orientation, a number of German scholars, among them Walter F. Otto, Hermann Güntert, Friedrich Cornelius, and F. R. Schröder, came to the same general conclusion: that it is impossible to understand any single ancient Indo-European religious system without reference to a common set of deities, rituals, and myths, and that it is indeed possible to conceive of such a common Indo-European tradition without reference to the discarded theories of Müller and Kuhn. Another driving force in this new effort was provided by Meillet, who, although he himself never attempted with Indo-European mythological materials the kind of broad synthesis that characterizes his *Introduction à l'étude des langues indo-européennes* (1922), encouraged his students to undertake such studies. One of these students was Georges Dumézil (1898–1986), a young philologist and historian of religions who took his doctorate under Meillet in 1924.

Like the other neo-comparativists, Dumézil sought to find a viable theoretical basis upon which to build a new paradigm for comparative Indo-European mythology. In his early studies, for example, *Le festin d'immortalité* (1924), *Le crime des Lemniennes* (1924), and *Le problème des Centaures* (1929), which focused on what he came to call the "ambrosia cycle," that is, the common Indo-European traditions surrounding the preparation and consumption of a deified beverage (*soma*, mead, ambrosia, and so forth), he drew heavily on Frazer's theory of death and rebirth and of the ritual sacrifice of the king. But as he himself later observed, the Frazerian model ultimately proved to be insufficient for his purposes; it simply could not explain the multitude of common motifs that pervaded the several Indo-European traditions.

After a decade of grappling with the problem, Dumézil took an extended leave from his academic duties in the early 1930s and undertook the study of ancient Chinese religion under the guidance of Marcel Granet (1884–1940), an eminent Sinologist who had also been one of Durkheim's most devoted disciples. Yet although the project began as an attempt to gain a perspective on the Indo-European tradition by coming to grips with a wholly different ancient belief system, it ended by providing Dumézil with the framework he had been searching for and that he came to call *la méthode sociologique*. Thus, in 1938, not long after he had completed his studies with Granet, Dumézil achieved the breakthrough he had been seeking, and the second grand paradigm in Indo-European studies was born.

THE SECOND GRAND PARADIGM: DUMÉZIL AND THE NEW COMPARATIVE MYTHOLOGY. Although the breakthrough itself came in 1938, the first hint of what Dumézil now refers to as the tripartite ideology actually surfaced shortly before he began his Chinese studies. In 1930 he published an article

comparing the three divisions of ancient Scythian society—the “Royal Scyths,” the “Warrior Scyths,” and the “Agricultural Scyths,” each of which was believed to have descended from one of the sons of the primeval figure Targitaus (Herodotus, 4.5–4.6)—with the three *varṇas*, or classes (later to become full-fledged castes) of Vedic India: the Brāhmas (priests), the Kṣatriyas (warriors), and the Vaiśhīyas (herders and cultivators, that is, the food producers). He also recognized that the sovereignty of the Royal Scyths was based on the myth that their ancestor, Targitaus’s youngest son, had managed to recover three fiery golden objects, a cup, an ax, and a yoked plow, each symbolic of one of the social divisions, that had fallen from the sky, although the full import of this symbolism did not become apparent until the new paradigm had fully crystallized. Two years later, in 1932, the linguist Émile Benveniste arrived independently at a similar conclusion relative to the parallels not only between the Scythian and Indian situations, but also among these two and the social classes of ancient Iran. However, all of the societies concerned belonged to the Indo-Iranian substock, and at the time there seemed to be no reason to conclude that this tripartite hierarchy of priests (or priest-kings), warriors, and cultivators was necessarily pan-Indo-European.

Nevertheless, in the years that followed, Dumézil began to pick up hints of an analogous structure in the Roman tradition (see, for example, *Flamen-Brahman*, 1935), especially in the makeup of the most ancient of the Roman priestly colleges, the *flamines maiores*. Could the distinctions between the *flamen Dialis*, or chief priest of Jupiter, the *flamen Martialis*, who presided over the cult of the war god Mars, and the *flamen Quirinalis*, who served the popular divinity Quirinus, an incarnation of the mass of Roman society, reflect the same structure he and Benveniste had discovered in the Indo-Iranian tradition, especially in light of the probable etymological connections between the two terms *flamen* and *brahman*? It was not until he had focused his attention upon the ancient Germanic pantheons in the course of giving a series of lectures at the University of Uppsala in Sweden in the fall of 1938 that he finally came to the realization that this threefold hierarchy was in fact pan-Indo-European, and that it was reflected in both the structure of the pantheons and the structure of society itself, especially in the system of social stratification. And here, of course, his recent exposure to Durkheimian theory in the course of his studies with Granet served him well. The Old Norse gods Óðinn, Thórr, and Freyr reflected the same basic type of social organization, even though the priestly, or Brahmanic, level had long since disappeared as a viable social entity by the time the myths were transcribed by Snorri Sturluson and Saxo Grammaticus. Óðinn (Odin), like Jupiter and the Vedic god Varuṇa, was a collective representation of ultimate sovereignty; Thórr was the incarnation of the warrior stratum and thus was cognate to Mars and Indra; while Freyr (together with his father Njorðr), like Quirinus and the Vedic Asvins (“divine horsemen”), represented the producing classes, that is, the herders

and cultivators upon whom the other two classes depended for nourishment.

Dumézil’s discovery was in large measure confirmed by his Swedish colleague Stig Wikander’s conclusive demonstration that among the most prominent features of ancient Indo-European social organization was the *comitatus* (“war band”), which typically formed itself around the person of a chief. According to Wikander, the *comitatus* was mythologically reflected by such otherwise diverse phenomena as Indra and his Marut (i.e., the Rudriyas) and the war bands that followed Irish heroes like Cú Chulainn and Finn (see *Der arische Männerbund*, 1938). Thus, thanks to Wikander, who became one of Dumézil’s earliest and most productive supporters (see below), a major piece of the puzzle had fallen into place.

A preliminary statement of the new model appeared in *Les dieux des Germains* (1939), which was based on the lectures Dumézil had given in Sweden, and for the next decade the discoveries came thick and fast. Dumézil rapidly came to the conclusion that the sovereign level, shortly to be labeled the “first function,” was in fact represented by two complementary divinities: Varuṇa, Jupiter, and Óðinn were primarily concerned with the maintenance of cosmic order (e.g., the Vedic concept of *ṛta*), while Mitra, Týr, and the otherwise obscure Roman divinity Dius Fidius were concerned with social and juridical sovereignty. This idea of the “joint sovereignty” formed the major focus of *Mitra-Varuna: Essai sur deux représentations indo-européennes de la souveraineté* (1940). The first comprehensive statement of the new paradigm appeared a year later in a book entitled *Jupiter, Mars, Quirinus* (1941). Although Dumézil here focuses on Rome and its mythological origins, this book spelled out in detail for the first time the concept that came to be known as the “three functions” of social organization, that is, the “first function” (cosmic and juridical sovereignty in all its manifestations), the “second function” (the exercise of military prowess), and the “third function” (the provision of nourishment, health, physical well-being, wealth, the welfare of the masses, etc.).

In short, by the end of the 1940s, in a remarkable series of books, monographs, and shorter works, Dumézil had fully articulated the basic elements of the second grand paradigm in comparative Indo-European religious studies. The Iranian and Celtic traditions had been brought into the picture, and a great many secondary themes had been discovered; for example, the recognition that the juridical sovereign (e.g., Mitra and Týr) typically had two ancillary manifestations, each of whom was concerned with an aspect of this function. In the Vedic texts, these were the figures Aryaman and Bhaga, who represented, respectively, the Aryan community itself, along with its most basic social relationship, marriage; and the equitable distribution of goods and rewards. This idea was first enunciated in *Le troisième souverain* (1949).

In his first articulations of the new paradigm Dumézil had relied heavily on the previously mentioned Durkheimian

proposition that “social facts” give rise to “supernatural facts,” or “collective representations.” However, as he himself observed, around 1950 his orientation began to shift, and he took what amounted to a long step beyond strict Durkheimianism and “la méthode sociologique.” Adopting what in retrospect may be called a more structuralist perspective, he began to conceive of the three functions as expressions of a deep-seated, tripartite ideology that was manifest in both social and supernatural contexts, but which ultimately lay outside either sphere. Thus, the functions were gradually redefined as “un moyen d’analyser,” a method of analysis, and this revised orientation is, in some respects, not dissimilar to the structuralist vision espoused by Claude Lévi-Strauss (b. 1908). There is, however, a major difference between the two French scholars: Lévi-Strauss (in such works as *Le cru et le cuit*, 1964) is concerned primarily with the “deep structure” of the human mind per se, while Dumézil remains committed to the proposition that the tripartite ideology is uniquely Indo-European, and that other major language families, such as the Sino-Tibetan, the Hamito-Semitic, and the Uto-Aztecan, are probably characterized by their own unique ideologies. Perhaps the best way to describe this approach is to label it “structural relativism.”

In the course of the next three decades more important discoveries were made, not only by Dumézil himself, but also by the scholars who have come to adopt the paradigm. One of the earliest of these was Stig Wikander, who in 1947 demonstrated the extent to which the heroes of the *Mahābhārata* (Yudhiṣṭhira, Arjuna, Bhīma, Nakula, and Sahadeva) were at bottom transpositions of the major Vedic divinities (Mitra, Varuṇa, Indra, and the Nāsatya) and showed that the tripartite ideology could be detected at the epic as well as the mythological level. Other early followers of Dumézil were Lucien Gerschel, Jan de Vries, Edgar Polomé, Robert Schilling, Jacques Duchesne-Guillemin, François Vian, and Marie-Louise Sjoestedt.

In the late 1950s and early 1960s a new generation of scholars was attracted to the Dumézilian model, including Jaan Puhvel, Donald J. Ward, Françoise Le Roux, and myself, and the paradigm was extended even more broadly. Among the major subthemes discovered by Dumézil and his colleagues over the years, in addition to Wikander’s 1947 breakthrough, were (1) the “three sins of the warrior,” that is, the recognition that Indo-European warrior figures (e.g., Indra, Herakles, and the Norse figure Starkaðr) typically commit three canonical “sins,” one against each of the functions, and (2) the “war between the functions,” manifested principally in the Roman and Germanic traditions, wherein representatives of the first two functions defeat representatives of the third and incorporate them into the system, rendering it complete (e.g., the Sabine war and the conflict between the Æsir and Vanir).

In the early 1970s Dumézil pushed the paradigm in yet another important direction (see *Mythe et épopée*, vol. 2, 1971, especially “L’enjeu du jeu des dieux: Un héros”)

through his discovery that Indo-European warrior figures such as the Vedic character Śiśupāla are in the final analysis but counters in a game played by the gods, and that the gods themselves can be sorted into “dark” and “light” categories—that is, those who represent the chaotic forces of nature and those who seek to control these forces. In the Indian tradition this dichotomy is reflected in the difference between the “dark” divinity Rudra and the “light” divinity Viṣṇu; in ancient Scandinavia it appears in that between Óðinn and Thórr. The full implications of this discovery are being probed by several of Dumézil’s disciples, among them Udo Strutynski and the author of this article.

In the course of what may be termed his *phase de bilan*, Dumézil’s remarkable scholarly output continued unabated. Among his subsequent books were a reexamination of the Indo-European concept of sovereignty (*Les dieux souverains des Indo-Européens*, 1977) and a disquisition on Indo-European attitudes toward marriage (*Mariages indo-européens*, 1979). He also published several collections of earlier writings, all of which bear on one or another aspect of the tripartite ideology. Dumézil’s career was capped in 1979 when he was elected to the Académie Française.

This is not to imply that the “new comparative mythology” has become universally accepted by Indo-Europeanists. Indeed, almost from the outset it has been the subject of intense and persistent criticism from a variety of scholars, many of whom have suggested that Dumézil imposed the tripartite model on the data, and that it has no existence save in the minds of the researchers concerned. Among the most persistent of these critics was Paul Thieme, an Indologist, who asserted on numerous occasions that Dumézil’s interpretation of the Indic pantheon, especially the role played by the god Aryaman, was wholly incorrect. Thieme interpreted the Sanskrit root *ari-* to mean “stranger” rather than “the people” (or “the shining ones”), the common meaning of most ethnic self-identification terms, modern as well as ancient—for example, Hopi, Diné (Navajo), and so forth. Other prominent critics have included H. J. Rose (who took Dumézil to task for ignoring the “manaistic” basis of Roman religion), Jan Gonda, Angelo Brelich, the Germanist E. A. Philippson, and John Brough, a Sanskrit scholar who claimed to have discovered the tripartite ideology in the Bible and therefore asserted that it was not uniquely Indo-European.

Dumézil vigorously responded to these and other criticisms, and to date no single critic has emerged as a potential “Andrew Lang” as far as this paradigm is concerned. Indeed, it is fair to say that the majority of contemporary scholars in the field of comparative Indo-European mythology and religion continue to make effective use of the general theoretical and methodological framework developed by Dumézil and his colleagues in the course of the last five decades. A good example is Joël Grisward, whose brilliant analysis of the medieval French legends of Aymeri de Narbonne and the extent to which they have Indo-Iranian counterparts (see his *Archéologie de l’épopée médiévale*, 1981) is, as Dumézil himself

noted, perhaps the most important contribution to the new comparative mythology since Wikander's discovery of epical transposition in 1947. Another excellent example can be seen in Udo Strutynski's convincing demonstration that the English weekday names, at least from Tuesday through Friday, and their cognates in other modern Germanic languages, represent a persistence of a tripartite ideological formula—that is, "Týr's day," "Óðinn's day," "Thórr's day," and "Frigg's day" (see his "Germanic Divinities in Weekday Names," *Journal of Indo-European Studies* 3, 1975, pp. 363–384).

It would be impossible in the space of this brief article even to mention, let alone discuss in any detail, all of the significant research that has been pursued since the late 1960s by specialists in comparative Indo-European religion and mythology who have oriented their work around the Dumézilian paradigm. For example, Atsuhiko Yoshida, a Japanese Hellenist who studied with Dumézil for the better part of a decade, has demonstrated the strong probability that the development of Japanese mythology was profoundly influenced, either directly or indirectly, by Indo-European themes in the late prehistoric period (that is, the fourth and fifth centuries CE), and that the most likely source of this influence was one or another tribe of North Iranian-speaking steppe nomads (Scythians, Alans, etc.) that managed to reach East Asia during this period (Yoshida, 1977). The late Ōbayashi Taryō, an anthropologist at the University of Tokyo, and the author of this article subsequently joined Yoshida in this effort. Bruce Lincoln has published a book comparing Indo-Iranian and contemporary East African religious attitudes toward cattle (*Priests, Warriors, and Cattle*, 1981). David Cohen has expanded the understanding of the "three sins" typically committed by the Indo-European warrior (see above) in a penetrating analysis of the Irish hero Suibhne ("Suibhne Geilt," *Celtica* 12, 1977, pp. 113–124).

In France, Daniel Dubuisson, who took his doctorate under Dumézil in 1983, has attempted to develop a quasi-mathematical approach to Indo-European myth, based in large part on his Indological research. More recently, in 1994, he published a major overview of the current status of comparative Indo-European mythology. Bernard Sergent has illuminated the dual kingship at Sparta by judicious application of the Dumézilian paradigm ("La représentation spartiate de la royauté," *Revue de l'histoire des religions* 189, 1976, pp. 3–52). And in 1984 Dean A. Miller investigated the trifunctional implications of the "three kings" in Sophocles' *Oedipus at Colonus* from what can best be termed a neo-Dumézilian standpoint. Other scholars who have extended the paradigm in a variety of new and potentially important directions include Steven O'Brien, Miriam Robbins, Alf Hiltebeitel, David B. Evans, and Jean-Claude Rivièrè.

SOME RECENT DEVELOPMENTS. Like all grand paradigms that have been pushed to their effective limits, the Dumézilian paradigm is fraying a bit at the edges, and several of the most important recent advances in Indo-European religious

studies have involved matters that transcend the tripartite ideology. One of these is the matter of "dark" and "light" divinities mentioned earlier. Indeed, Dumézil himself suggested that this dichotomy cuts across the three functions, and perhaps reflects a more fundamental binary structure that underlies social and supernatural tripartition. If this proves to be the case, it may well be that the ideological model Dumézil first detected some fifty-odd years ago is but a special case of a broader and more deep-seated mental template, as it were, that is shared by *homo religiosus* as a whole. Such a template, if it exists, would closely parallel the presumably universal "deep structure" of the human psyche posited by Lévi-Strauss.

Another extremely significant development involves the nature of the common Indo-European cosmology, something Dumézil never really came to grips with and which, heretofore, had defied all attempts at elucidation via the tripartite ideology. In 1975, Puhvel and Lincoln, working independently, reached compatible conclusions; they agreed that the elusive cosmology was in fact embedded in a theme, present in the Roman, Indo-Iranian, and Norse traditions, wherein a primeval being kills his twin and makes the world from the latter's remains. This theme closely approximates the nearly universal concept of what Adolf E. Jensen calls the "dema deity," that is, a sacrificial victim whose body parts provide the *materia prima* of either the world itself or some important part thereof (as in the Ceramese myth of Hainuwele; see Jensen, *Myth and Cult among Primitive Peoples*, 1963).

For Puhvel, the point of departure was the pseudo-historical account of Romulus and Remus, in which the latter is killed shortly after the founding of Rome. Underlying the names *Romulus* and *Remus*, Puhvel suggests, are **Wironos* ("man") and **Yemo(n)s* ("twin"), to which may be compared *Yama* (Skt.), *Yima* (Av.), and *Ymir* (ON), as well as *Mannus* and *Tuisto*, mentioned in Tacitus's *Germania*. Although Romulus/**Wironos* did not explicitly "make the world" from Remus/**Yemos*'s remains, Remus's death seems clearly to have been somehow essential to the building of the city, like a sacrificial offering, and the fact that Remus's "crime" consists of jumping over the newly dug foundation for the city wall implies that the victim's essence was in one way or another mixed with the mortar that eventually filled the ditch. Lincoln's point of departure was the Indic manifestation of the theme and its implications as they relate to the *dema*-deity concept, that is, the account in *Rgveda* 10.90 wherein Manu (i.e., "man") sacrifices *Yama* (or *Puruṣa*, as he is called in the Vedic text) and creates the world from his corpse. (Unlike Remus/**Yemos*, *Puruṣa* was a willing victim, and Manu is credited with originating the institution of religious sacrifice; however, the basic context of the two accounts is remarkably similar.) As luck would have it, Lincoln sent a draft of his manuscript to Puhvel for comment and criticism, and the result was a pair of seminal articles that in 1975 appeared back-to-back in *History of Religions*.

The paradigmatic implications of this discovery are still under investigation, and various questions have been raised by scholars. Does the ideology itself spring from this primordial sacrifice? Is it possible that the account of Romulus and Remus, who began life as the foster children of a shepherd, became warriors, and finally went off to found a city, is a euhemeristic survival of an ontological myth wherein the three functions emerge successively after a primeval fratricide? And is there a connection between the *dramatis personae* of this primeval drama and the dark/light dichotomy (see above)? Or does the theme in question lie totally outside the parameters of the paradigm? As yet no clear answers have been provided to these questions.

Yet another extremely significant discovery relating to Indo-European religion was N. J. Allen's 1987 compelling case for the existence of a "fourth" ideological function (or "F4," as he labels it) that lies outside the tripartite paradigm per se and can thus be described as "other." A good example of a "fourth function" phenomenon in the Indic tradition the Shudra caste, that is, the non-Aryan outsiders, who are "other" to the three twice-born Aryan *varna* (that is, the Brāhmaṇs, Kṣatriyas and Vaiśhīyas, who reflect "F1," "F2" and "F3," respectively). This concept adds a new and extremely important dimension to the Dumézilian paradigm, the implications of which are only just beginning to be appreciated.

The common denominators among the several Indo-European epic traditions have also been the subject of some important recent research. For example, Dean A. Miller's book *The Epic Hero* (2000) has materially advanced the understanding of this most important aspect of the Indo-European worldview, while Julian Baldick's (1994) convincing demonstration that the *Iliad* is fundamentally cognate not to the *Mahābhārata*, as has long been held, but rather to the *Rāmāyana*, has led some scholars, including the author of this article, to the conclusion that the two epics in question are, at bottom, reflexes of a common Indo-European concern with abducted brides and their rescuers. Other reflexes of this concern may include the medieval European tale of Tristan and Isolde and the Middle High German Kudrun epic, both of which involve figures broadly similar to Helen, Sītā, Rāma, Menelaus, Agamemnon, and the rest. Moreover, Baldick has gone on to suggest that the *Mahābhārata* is cognate to the *Odyssey*, in that they both involve accounts of exiled kings who eventually return to reclaim their thrones after a climactic battle (e.g., the Battle of Kurukshetra in the *Mahābhārata*, in which the Pāndava defeat their enemies and restore Yudhisthira to his rightful throne, and Homer's account of the slaying of Penelope's suitors by Odysseus and Telemachus).

Finally, the importance of binarism in the Indo-European tradition, that is, the all-pervasive difference between "light" and "dark," which, as has been noted, Dumézil came to recognize late in his career, is something that may link it to far older Nostratic and even, perhaps, Eurasiatic

traditions dating as far back as the Upper Paleolithic (that is, prior to 10,000 BCE), has begun to be recognized (see Littleton 2002). Indo-European religion is thus beginning to be grounded in the broader context of the Eurasian tradition, which took shape in Central Asia millennia before anything identifiable as Proto-Indo-European appeared on the scene.

In sum, as the field of Indo-European religious studies enters its third century it remains a vigorous and intellectually viable discipline. In the course of the last two hundred-plus years it has managed to develop and then transcend one grand paradigm (naturism) and is currently dominated by a second (the new comparative mythology). How long this second paradigm will continue to reign is uncertain; as has been indicated, there are already signs that it may have begun to outlive its usefulness. But whatever may be the ultimate fate of the Dumézilian model—and one suspects that it will eventually become a "special case" of a much broader paradigm, the outlines of which cannot yet be clearly perceived, although Allen's aforementioned seminal discovery of a fourth function does provide a glimpse of what may lie ahead—the discipline itself will almost certainly persevere, and will continue to contribute important insights not only into a fundamental aspect of the heritage shared by all Indo-European speakers, but also into the nature of religion per se.

Demonstrates that the heroes of the *Mahābhārata* reflect the tripartite ideology and were derived from the Vedic divinities. Wikander’s essay was a major step forward in the development of the new comparative mythology.
- Yoshida, Atsuhiko. “Japanese Mythology and the Indo-European Trifunctional System.” *Diogenes* 98 (1977): 93–116. Summarizes the evidence suggesting that Japanese mythology, as expressed in the *Kojiki* (712 CE) and the *Nihonshoki* (720 CE), was influenced by the tripartite Indo-European ideology at some point in the late prehistoric period.

C. SCOTT LITTLETON (1987 AND 2005)

INDRA. In India the worship of the god Indra, king of the gods, warrior of the gods, god of rain, begins properly in the *R̥gveda*, circa 1200 BCE, but his broader nature can be traced farther back into the proto-Indo-European world through his connections with Zeus and Wotan. For although the *R̥gveda* knows a sky father called Dyaus-pitr, who is literally cognate with Zeus-patēr and Jupiter, it is Indra who truly fills the shoes of the Indo-European celestial sovereign: He wields the thunderbolt, drinks the ambrosial *soma* to excess, bestows fertility upon human women (often by sleeping with them himself), and leads his band of Maruts, martial storm gods, to win victory for the conquering Indo-Aryans.

In the *Rgveda*, Indra's family life is troubled in ways that remain unclear. His birth, like that of many great warriors and heroes, is unnatural: Kept against his will inside his mother's womb for many years, he bursts forth out of her side and kills his own father (*Rgveda* 4.18). He too is in turn challenged by his own son, whom he apparently overcomes (*Rgveda* 10.28). But the hymns to Indra, who is after all the chief god of the *Rgveda* (more than a quarter of the hymns in the collection are addressed to him), emphasize his heroic deeds. He is said to have created the universe by propping apart heaven and earth (as other gods, notably Viṣṇu and Varuṇa, are also said to have done) and finding the sun, and to have freed the cows that had been penned up in a cave (*Rgveda* 3.31). This last myth, which is perhaps the central myth of the *Rgveda*, has meaning on several levels: It means what it says (that Indra helps the worshiper to obtain cattle, as he is so often implored to do), and also that Indra found the sun and the world of life and light and fertility in general, for all of which cows often serve as a Vedic metaphor.

It was Indra who, in the shape of a falcon or riding on a falcon, brought down the *soma* plant from heaven, where it had been guarded by demons, to earth, where it became accessible to humans (*Rgveda* 4.26-27). Indra himself is the *soma* drinker *par excellence*; when he gets drunk, as he is wont to do, he brags (*Rgveda* 10.119), and the worshiper who invites Indra to share his *soma* also shares in the euphoria that *soma* induces in both the human and the divine drinker (*Rgveda* 9.113). But Indra is a jealous god—jealous, that is, of the *soma*, both for lofty reasons (like other great gods, he does not wish to allow mortals to taste the fruit that will make them like unto gods) and for petty reasons (he wants to keep all the *soma* for himself). His attempts to exclude the Aśvins from drinking the *soma* fail when they enlist the aid of the priest Dadhyañc, who disguises himself with a horse's head and teaches them the secret of the *soma* (*Rgveda* 1.117.22).

But Indra's principal function is to kill enemies—non-Aryan humans and demons, who are often conflated. As the supreme god of the *ksatriyas* or class of royal warriors, Indra is invoked as a destroyer of cities and destroyer of armies, as the staunch ally of his generous worshipers, to whom Indra is in turn equally generous (Maghavan, "the generous," is one of his most popular epithets). These enemies (of whom the most famous is Vṛtra) are often called Dāsas or Dasyus, "slaves," and probably represent the indigenous populations of the subcontinent that the Indo-Aryans subjugated (and whose twin cities, Mohenjo Daro and Harappa, in the Indus Valley, may have been the citadels that Indra claims to have devastated). But the Dāsas are also frequently identified with the *asuras*, or demonic enemies of the gods themselves. The battles thus take place simultaneously on the human and the divine levels, and are both political and cosmogonic.

Indra's reputation begins to decline in the Brāhmaṇas, about 900 BCE, where his supremacy is preempted by Prajāpati, the primordial creator. Indra still drinks the *soma*,

but now he becomes badly hungover and has to be restored to health by the worshiper. Similarly, the killing of Vṛtra leaves Indra weakened and in need of purification. In the epics, Indra is mocked for weaknesses associated with the phallic powers that are his great glory in the *Rgveda*. His notorious womanizing leads, on one occasion (when the sage Gautama catches Indra in bed with Ahalyā, the sage's wife), to Indra's castration, though his testicles are later replaced by those of a ram (*Rāmāyaṇa* 1.47-48); in another version of this story, Indra is cursed to be covered with a thousand *yonis* or vaginas, a curse which he turns to a boon by having the *yonis* changed into a thousand eyes. When Indra's excesses weaken him, he becomes vulnerable in battle; often he is overcome by demons and must enlist the aid of the now supreme sectarian gods, Śiva and Viṣṇu, to restore his throne. Sometimes he sends one of his voluptuous nymphs, the *apsaras*, to seduce ascetic demons who have amassed sufficient power, through *tapas* ("meditative austerities"), to heat Indra's throne in heaven. And when the demon Nahuṣa usurps Indra's throne and demands Indra's wife, Śacī, the gods have to perform a horse sacrifice to purify and strengthen Indra so that he can win back his throne. Even then Indra must use a combination of seduction and deceit, rather than pure strength, to gain his ends: Śacī goads Nahuṣa into committing an act of hubris that brings him down to a level on which he becomes vulnerable to Indra.

Old Vedic gods never die; they just fade into new Hindu gods. Indra remains a kind of figurehead in Hindu mythology, and the butt of many veiled anti-Hindu jokes in Buddhist mythology. The positive aspects of his person are largely transformed to Śiva. Both Indra and Śiva are associated with the Maruts or Rudras, storm gods; both are said to have extra eyes (three, or a thousand) that they sprouted in order to get a better look at a beautiful dancing *apsaras*; both are associated with the bull and with the erect phallus; both are castrated; and both come into conflict with their fathers-in-law. In addition to these themes, which are generally characteristic of fertility gods, Indra and Śiva share more specific mythological episodes: Both of them seduce the wives of *brahman* sages; both are faced with the problem of distributing (where it will do the least harm) certain excessive and destructive forces that they amass; both are associated with anti-Brahmanic, heterodox acts; and both lose their right to a share in the sacrifice. And just as Indra beheads a *brahman* demon (Vṛtra) whose head pursues him until he is purified of this sin, so Śiva, having beheaded Brahmā, is plagued by Brahmā's skull until he is absolved in Banaras. Thus, although Indra comes into conflict with the ascetic aspect of Śiva, the erotic aspect of Śiva found new uses for the discarded myths of Indra.

WENDY DONIGER (1987)
Revised Bibliography

INDUS VALLEY RELIGION is the goddess-centered religious system of the urban civilization that emerged in the Indus Valley of western India around 2500 BCE and declined into a series of successor posturban village cultures after 1750 BCE. The antecedents of this religion lie in the village cultures of Baluchistan and Afghanistan, which were part of a larger regional cultural system in western Asia that also included the village cultures of southern Turkmenistan and the Elamite culture of southwestern Iran. Common religious patterns within this larger region continued into the early stages of urbanization in Elam, Turkmenistan, and the Indus Valley, after which the unification of the local regions and subsequent historical changes led to separation: Elam was drawn into the orbit of Sumerian and Akkadian culture; Turkmenistan was settled by new groups from the northern steppes; and Indus settlement shifted eastward into the Ganges-Yamuna Valley in the North and Gujarat and the Deccan Plateau in the South as the original cities in the Indus Valley were abandoned. After the entry of Aryan tribes into northern India around 1500 BCE, the continuity of Indus Valley religion is found mainly in the Dravidian cultures of South India, although various elements were also preserved in the village cultures of North India and in the synthesis of Aryan and non-Aryan cultures that marked late Vedic and post-Vedic developments in the Ganges-Yamuna Valley.

THE WESTERN ASIAN SETTING. The evolution of the Neolithic cultures of western Asia that preceded the Indus civilization cannot yet be reconstructed in detail, but a pattern is emerging from current evidence that sheds new light on the basic features of the Indus Valley religious system. Archaeological research in southern Turkmenistan has revealed a continued sequence of village cultures north of the Kopet Dagh Mountains from at least 6000 BCE onward, culminating in a regional urban culture at Namazga and Altin around 2500 BCE. Research on the proto-Elamite and proto-Dravidian languages points to a common proto-Elamo-Dravidian ancestry among a pastoral people moving southward from Central Asia into Iran sometime between 8000

and 6000 BCE, combining the herding of goats, sheep, and cattle with the cultivation of wheat and barley, and gradually separating into two branches: a proto-Dravidian branch that settled eastward in Afghanistan and Baluchistan, and a proto-Elamite branch that continued westward across southern Iran to the Zagros Mountains. The broadly based set of common cultural features established throughout western Asia in this early period and reinforced by later interregional contacts is reflected in similar patterns of proto-urban development and urbanization between 3500 and 2500 BCE in the various localized regions.

Because the Indus civilization's script has not been deciphered, the proto-Dravidian identification of the Indus language remains uncertain. There is broad scholarly consensus, however, that a form of proto-Dravidian was the dominant language of the Indus urban culture, and this is substantiated by parallels between cultural and religious features of the Indus civilization and later Dravidian village culture. These parallels, in conjunction with the pre-urban cultural affinities with Elam and Turkmenistan, provide a framework for interpreting the evidence from village and urban sites in the Indus Valley region and constructing a hypothetical picture of Indus Valley religion.

The single most significant religious feature in all of the western Asian village cultures is the importance of female powers or goddesses, as evidenced by stylized clay and terracotta female figurines in a variety of types that appear—often in conjunction with figurines of bulls or rams—from the early levels of village culture on into the urban periods in Turkmenistan, Elam, and the Indus Valley. Whether they represent specific goddesses or powers is impossible to determine without more information, and the villages are mute. Evidence of coherent mythologies only appears in the richer range of artifacts at the urban level, and by then, in all of the urban regions, clearly defined goddesses had become part of complex urban cultic systems that reflect at least in part differences in regional urbanization. Enough affinities remain, however, to provide clues to the Indus Valley system.

Turkmenistan, where extensive excavation has been carried out, provides a valuable point of reference for parallel developments in Afghanistan, Baluchistan, and the Indus Valley. Turkmenistan village sites show four millennia of clay and terracotta goddess figurines and figures of male animals, most often rams and bulls. The goddesses appear in a variety of styles and are often marked with painted stripes, dot-centered circles, or clusters of pocked depressions; most have concentrated attention on the breasts, thighs, and buttocks, and they often have either no arms or vestigial stumps. One distinctive type, the so-called foot profile style, shows the truncated legs and torso of a female in a semireclining posture.

Evidence from early sites indicates that special areas were set aside as shrine rooms for a likely domestic cult. Enclosed village shrines appear by the fifth or fourth millennium along with a new type of Namazga III "foot profile" figu-

rines with elaborate hairdos. The Bronze Age Namazga IV culture, concurrent with developments in early Elam and the pre-Indus village cultures of Baluchistan and Afghanistan, has evidence of more elaborate shrines and a range of figurine types. Finally, around 2500 BCE, a full urban culture appeared in the Namazga V period that was contemporary for several centuries with the early phases of the Indus cities.

Urbanization in Turkmenistan brought not only greater complexity but also dramatic new religious forms. A massive brick platform, with three stepped tiers reaching forty feet in its final height, was built on the edge of the Namazga V site of Altin. This was certainly a center for public rituals, and implies a class of professional priests or priestesses. A richly endowed burial of a woman holding two female figurines in her hands has been tentatively named a “priestess’s grave.” Namazga V figurines are in a new and highly abstract style: flat fiddle-shaped cutouts with no legs, stylized triangular arm extensions, pinched maskedlike faces usually without a mouth, conical breasts, and a stippled pubic triangle with a vaginal line. There is evidence of a more standardized iconography and a clearer identification of individual figurines, including the use of different hair styles and engraved markings that resemble signs found in the Elamite and Indus writing systems.

Goddess worship in Turkmenistan clearly survived the transition from Neolithic to Bronze Age culture and subsequent urbanization. The styles of representation changed, the identities and meanings of individual goddesses may have varied, and the form of cultic practice certainly differed dramatically at the urban level from that in early villages, but the goddesses and their powers remained the central focus of religious life throughout the millennia. Much the same pattern can be seen also in the Elamite culture of southwestern Iran.

The foundation of Elamite culture was laid by proto-Elamite-speaking settlers who brought wheat and barley cultivation and the herding of sheep, goats, and cattle into the southern Zagros Mountain region of Iran sometime after 7000 BCE. By 4000 BCE, cultivation had been carried into the lowlands of Khuzistan at the western base of the Zagros, providing an agricultural base for urbanization. Sumer, across the Tigris in southern Mesopotamia, achieved urbanization around 3500 BCE. By 3200 BCE, Khuzistan and the Zagros highlands had been united in the rival urban civilization of Elam, with a highland capital at Anshan near later Persepolis and a lowland capital at Susa. Within the next two centuries, a proto-Elamite script had been developed and Elam had extended its influence eastward along a trade network that passed through Tepe Yahya in southern Iran as far as the Nal village culture of southern Baluchistan.

The expansion of Elamite urban culture was limited to the early third millennium, and its eastern trading centers had been abandoned several centuries before the first Indus cities emerged. The similarity between the later Indus script and the proto-Elamite script provides circumstantial evi-

dence for the transfer of writing during this period, because the proto-Elamite script had been replaced by cuneiform by the middle of the third millennium; there is, however, no evidence of direct Elamite influence on Indus urbanization. Yet if Elam cannot be assigned a significant causal role in the creation of Indus civilization, it nonetheless provides an important model for understanding Indus Valley religion because of the many evident parallels between the two traditions.

Pre-urban cultural levels at Persepolis and Susa reveal a familiar pattern of female figurines and goddess worship, and painted pottery at these sites reveals a related concern for serpents as objects of religious veneration—a combination found also in the Dravidian villages of South India, and further evidence for an earlier common culture. Terracotta female figurines from Susa and other sites in the early third millennium show that goddess worship survived the transition from agricultural villages to urbanization in Elam as in Turkmenistan. The religious data from urban proto-Elamite sites such as Susa, however, are much richer than that of Turkmenistan and reveal not only the importance of goddesses in urban religious life but also an elaborate system of myths, symbols, and cultic practices.

Cylinder seals in a distinctive proto-Elamite style provide the most valuable evidence for the symbolism of this period. Many of the motifs in the proto-Elamite seals can be traced back to painted designs on earlier village pottery, but the more elaborate seal designs reflect a new urban sophistication: complex mythic or ritual scenes; symbolic designs involving mountains, trees, and animals (bulls and rams most often, but also lions and other felines); and an androgynous bovine in a variety of humanlike poses characteristically found in the figurines of goddesses. This latter figure is most likely the animal form or surrogate of the main Elamite fertility goddess, a moon goddess who was born from the Primeval Bull and was both the protector and soul of cattle—roles certainly consistent with the symbolism of the seals. None of the other figures can be identified with any certainty, and the meaning of individual symbols and scenes remains obscure in the absence of explanatory myths. In general, however, the symbolism reflects a developed fertility religion with its roots in the village past—probably a mountain past—but with new dimensions and new meanings in the urban culture: a religion in which the village goddesses have become patron deities of the city as well.

Cylinder seals, supplemented by other data, allow at least a partial reconstruction of proto-Elamite cultic practices. One seal shows a goddess or priestess being drawn in procession in a chariot flanked by moon symbols and horned cattle; another shows a tree in procession in a similar chariot, also with horned cattle and moon symbols; another shows an image or shrine on a palanquin flanked by attendants carrying moon symbols and what are either snakes or snake symbols in their hands. The goddess being honored in all of these scenes is almost certainly the moon goddess, whose connection with trees, serpents, and horned animals is indi-

cated on a seal from the late third millennium that shows priests wearing belts or girdles of snakes around their waists and a device on their heads that combines the symbolism of crescent-shaped horns and trees.

Ritual processions and pilgrimages to sacred sites were apparently important features of Elamite religion. Elamite reliefs from around 2000 BCE depict long lines of worshipers in procession, confirming the evidence from earlier proto-Elamite seals. Sumerian texts from the same period describe similar practices associated with the moon goddess Inanna, whose characteristics closely match those of the main Elamite goddess with whom she was later assimilated. A hymn to Inanna vividly describes a parade of priestesses, musicians with harps, drums, and tambourines, and a priest who sprinkles blood on the goddess's throne, and notes that men in the procession "adorn their left side with women's clothing" while women "adorn their right side with men's clothing" (Wolkstein and Kramer, 1983, p. 99).

The centers of Elamite worship were the shrines and temples erected for the goddess, usually in high places and with an associated sacred grove. In Susa, temples to the major deities were located on an elevated sacred area on the western edge of the city between the river and the royal establishment. The main ritual activity in the temples was animal sacrifice, and raised altars with drains attest to the emphasis on blood in these sacrificial rites. The major sacrificial festival to the goddess at Susa was descriptively called a "day of the flowing sacrifice" in tribute to the quantity of blood offered on this occasion.

THE ELAMO-DRAVIDIAN PATTERN. The significance of these features of Elamite religion for comparative purposes is the light they shed on those aspects of Indus Valley religion for which there is no available Indus evidence. Indus seals and votive figurines, for example, suggest that Indus religion was based on some form of animal sacrifice centered around goddesses, but there is no direct evidence of ritual practice. Indus stamp seals, however, depict goddesses, trees, tigers, and horned animals such as rams, bulls, and water buffaloes in various combinations in mythic or cultic scenes. In other symbolic settings snakes appear as sacred animals. One scene portrays a line of androgynously appareled worshipers parading before a buffalo-horned goddess in a tree. This is the same basic set of symbols—goddesses, trees, lions/tigers, horned animals, snakes, and androgynous figures—found on Elamite cylinder seals, and indicates a significant body of shared religious concepts that reflect the common proto-Elamo-Dravidian ancestry and presuppose a common ritual practice. The relevant ritual in Elamite religion was blood sacrifice to the goddess, as it was also, along with many of the same symbols, in later Dravidian village religion. It is thus highly likely that Indus Valley religion followed the same Elamo-Dravidian pattern.

This is not a case of wholesale borrowing of Elamite religion or of basing Indus urban culture on external models. There are well-documented influences from Turkmenistan

for at least a millennium prior to urbanization in the Indus Valley, and there must have been some degree of contact with Elam during the late stages of Indus urbanization to account for the similar scripts. Indus urbanization may have been stimulated by these contacts, just as trade and interregional contacts stimulated urbanization throughout western Asia. The similarities between Indus urban culture and other western Asian cultures, however, were general family resemblances, like those between the Elamite and Dravidian language systems. Indus urban culture was both unique and uniquely Indian, as much a product of the regional setting as of the common western Asian heritage, with characteristic features that were deeply rooted in the pre-urban cultures of Afghanistan and Baluchistan.

The groundwork for Indus urbanization was laid by a series of village cultures in the highlands west of the Indus Valley, the earliest of which dates from around 6000 BCE. Archaeological research since the 1950s has revealed several early aceramic settlement sites with subsequent pottery development and domestication of local plants and animals, proving that the Indus region contributed to the Neolithic revolution and was not just a recipient of imported culture. By the early fourth millennium local village cultures had been established in northern and central Baluchistan, and by the mid- to late fourth millennium these cultures had been linked by trade with the Namazga III culture of southern Turkmenistan.

By around 3000 BCE, when Elam was extending its influence eastward, the Nal culture had emerged in southern Baluchistan and the Nal-related Amri culture had expanded into the southern Indus Valley. By early in the third millennium another related culture known as Kot Dijian had expanded northward along the Indus from the region of later Mohenjo-Daro as far as the later sites of Harappa and Kalibangan. These new developments laid the foundation for urbanization.

Goddess worship was an integral part of Indus village culture, as can be seen from the example of Mehrgarh, the oldest known continuous settlement site within India proper. Discovered in the 1970s at the eastern end of the Bolan Pass, Mehrgarh spans the range from aceramic settlement around 6000 BCE to the brink of urbanization around 2600 BCE. Goddesses in the form of female figurines appear at every cultural level, and their evolution is intertwined with the development of the Indus region.

The earliest figurines from Mehrgarh date from the sixth and fifth millennia, a period when pottery was being developed, cultivation was expanding, and local animals—especially humpbacked cattle (zebus)—were being domesticated to replace the earlier reliance on hunting. The style of these first Indian village goddess figurines was the "foot profile" style found also in Turkmenistan, and this style continued essentially unchanged down to around 3000 BCE. At that point, reflecting Mehrgarh's greater involvement in regional trade, there was a convergence toward the pinched-faced,

goggle-eyed “Zhub mother goddesses” from the Zhub culture in northern Baluchistan. During the village’s final century, from 2700 to 2600 BCE, nude goggle-eyed female figurines were being produced commercially by the thousands at Mehrgarh and are for the first time in a standing position like Zhub figurines. Nude male figures, also standing, with shoulder-length hair and Zhub-like goggle eyes, suggest for the first time the possibility of a divine couple.

The end of Mehrgarh’s final century marks the beginning of urbanization. As in Turkmenistan, the new iconography of female figurines and the appearance of male figurines coincided with the building of monumental ritual platforms. At Mehrgarh, the platform was a massive structure of brick faced with plaster with a colonnade of square mud-brick columns in front. This was contemporary with others in the larger contiguous area, one of which, near Quetta, had drains in the center and a stone-built hollow containing a jawless human skull, perhaps evidence of a “building sacrifice” in the platform’s construction. Near this platform were found figurines of females and cattle with painted stripes.

Other platform structures of note belonged to the Kulli culture, which gradually replaced the Nal culture in southern Baluchistan after about 3000 BCE and was still flourishing when the Indus civilization emerged on its eastern boundaries about five centuries later. Near the fertile stretches of the Porali River elaborate ceremonial centers were built on a new vast scale: At one typical site are two stone-built platforms about thirty feet high with ramps to the top and, nearby, a complex of over forty buildings. The Kulli ceremonial centers are set apart from the nearby agricultural villages with which they share common artifacts such as pottery and figurines. As the latter include both goddess figurines and striped cattle, it is likely that the cattle were votive offerings to the goddess. The whole combination, with platforms, wells, and drains, clearly suggests a ritual pattern involving sacrifice and ablution. The goddess figurines show a combination of originally Elamite postures with other styles (Zhub, Mehrgarh) developed regionally in western India. Although the Indus Valley civilization synthesizes elements from all these cultural styles, Kulli figurines and ceremonial centers provide its most direct prototypes.

HARAPPA AND MOHENJO-DARO. The Indus civilization has been widely noted for its rapid development and continued stability over a seven-hundred-year period from around 2500 to 1750 BCE. Over an estimated 500,000 square miles, the same basic cultural features recur from the cities to the several hundred towns and villages so far discovered. Such uniformity is striking, because unlike the concentrated settlement patterns in Mesopotamia, Indus sites were often well over fifty miles apart. It was the long-established base of village agriculture—wheat and barley cultivation along with cattle herding—that by the mid-third millennium provided the base for urbanization. The new cities, however, also broke with traditional village cultural patterns, and imposed new developments upon them. The two largest, Harappa and

Mohenjo-Daro, both seem to go back to the civilization’s beginnings. Their founding was no doubt decisive in setting the new political, economic, and religious styles. To the north, Harappa was built over an earlier Kot Dijian farming village, while to the south, Mohenjo-Daro’s new urban culture dominated and soon replaced the neighboring village of Kot Diji and the local culture of Amri farther south. Similarly, at the smaller Indus city of Kalibangan farther east, the imposition of the new urban culture included construction of an Indus style ritual platform on the mound of an earlier fortified Kot Dijian agricultural settlement.

Mohenjo-Daro and Harappa were both built on a similar plan, one that smaller sites replicate. The cities were divided into two basic components: a lower city, about three miles in circumference with rectangular grid streets, and an upper area on each city’s western edge formed by a brick-walled platform on an artificial mound that leveled some twenty feet above the surrounding plain. The massive exterior walls of the two major cities, over forty feet thick at the base, served to protect against flooding; Mohenjo-Daro from the Indus River, Harappa from the Ravi. Mohenjo-Daro was the larger of the two, and in most matters preserves the best evidence, as most of the Harappa mound was destroyed either by erosion or by its dismantling in 1856 by British engineers to provide ballast for a railroad. It was not until the early 1920s that the antiquity of Indus sites was recognized.

The lower city’s residential and commercial character is evident at Mohenjo-Daro. The exterior baked-brick walls lining the main street were for the most part without adornment or direct street access. Residences range from barrack-like dwellings to multistoried complexes, two of which have been dubbed a palace or hostel, but the typical residence was of a still-common South Asian type: small rooms around a central courtyard. Interspersed among residences were various shops and ateliers, and a large area with threshing floors has been found at Harappa. The lower city shows no clear evidence of dominant religious structures. In continuation of village patterns, there probably was a domestic cult centered in the home, perhaps connected with the terracotta female figurines and the elaborate drainage system that suggests a concern for hygiene and purity. But for the culture’s larger religious patterns one must turn elsewhere, and first of all to the raised platform mound on the western edge of the urban complex.

The standardization of the urban plan suggests that dominant political and religious sanctions lay behind the civilization’s conservatism. It is noteworthy that the two major cities show none of the gradual growth that occurred in Mesopotamian cities, but were built from the very beginning with their dominant platform mounds. One may assume from this that the civilization’s basic values were set and preserved by those who established these structures, and that their functions were connected with the architectural eminences they created.

These platform structures—often misleadingly called citadels—did not have a primarily defensive purpose. Though the heavily walled mounds at some of the more decentralized locations like Harappa and Kalibangan may have been used defensively, and the Mohenjo-Daro platform had watchtowers fortified with pellets, it is noteworthy that at a time when Mesopotamian rulers had for several centuries raised large armies to extend their power, the Indus cities leave no traces of arrows, spears, or swords.

Rather than citadels, the monumental platforms are thus no doubt continuations of the structures found at pre-urban village sites, but on a far grander scale, with a surface area large enough for several big buildings. With such structures, they differ from unoccupied platforms elsewhere (most notably Altin in Turkmenistan). But they bear a resemblance to the “acropolis” at Elamite Susa, also on the west of the city, and the purpose is clearly similar: to give prominence to the institutions and activities set apart and above. It is even possible, with the Kulli culture as an intermediary, that Elam provided the model for the Indus platforms, as for its script. But in specific features the Indus platform reflects an independently emergent tradition with its own cultural dynamics.

Most of the structures on the Mohenjo-Daro mound have been variously identified. A large columned building was probably an assembly hall; another has been dubbed a college. Definite is a granary; with grain as the primary measure of wealth and medium of exchange, the control of grain distribution was tied to civic authority. Yet most distinctive was a structure called the Great Bath.

The Great Bath itself was both literally and no doubt also symbolically the center of this complex. A large rectangular bitumen-lined tank in a colonnaded courtyard, it had steps leading down into its water from both ends. Clearly the steps were for bathing, and possibly for crossing from one end to the other. Moreover, the trouble taken to build such an *elevated* bath probably reflects an intensified concern for purification already evident in the lower city. In later Indian notions, higher waters are purer. Quite likely the whole complex—with wells, bathing rooms, and bath—served for the performance of purification rites supervised or enacted by priests. And because it was situated adjacent to the granary, such concerns probably also tied in conceptually with an interest in agricultural fertility.

In all this one is faced with a combination of concerns similar to those that underlay the practices connected with the platform mounds of pre-Indus villages. There is a new assertion of political, economic, and religious authority in the building of such massive structures in the heart of the riverine plain. The platforms themselves, however, must have been more than *assertions* of power by a new urban elite; they must also have been intended as *sources* of power: not because they were dominant physically, but because they provided a stage for rituals that would bring the ascendant cultural forces into harmony with the divinely empowered order of

nature so evident in the nearby rivers, herds, and fields of grain.

One representation of divinity in Indus sites has been met: the terracotta female figurine, a surviving type from pre-urban village cultures, with the closest analogues being from Kulli and Zhob. Similar figurines also reappear in classical periods of Hinduism and serve as models for the *yakṣīs* on early Buddhist stupas. The basic Indus type has bare breasts, tapered or full-length legs, a girdle, heavy pendant necklaces, and an elaborate hairdo. Whether one or more goddesses is represented is uncertain, but parallel evidence from Elam suggests an iconographic differentiation. A few male figurines have also been found. While human figurines are predominantly female, animal figurines are invariably male. Most common are various bovines: zebu, short-horned bulls, and water buffalo. Most likely different kinds of potency were represented: that of the female in the form of the anthropomorphic goddess, that of the male in animal form, perhaps linked with symbols of civic power.

INDUS VALLEY SEALS. For further insights into the religious conceptions of the Indus Valley civilization, however, one must turn to a new iconography that has no precedent in the pre-urban village cultures. This comes from the controversial evidence of the Indus Valley seals. Here again, however, one must reckon with prior developments in Sumer and Elam, which produced cylinder seals earlier than the flat steatite (soapstone) stamp seals—measuring about $\frac{3}{4}$ – $1\frac{1}{4}$ inches per side—of Indus sites. Although Elamite seals are linked typologically to Sumer, their subjects are distinctively Elamite, and in certain cases present images with Indus counterparts, indicating the likelihood of iconic cross-fertilization. Thus, two cylinder seals from Susa seem to draw on familiar Indus motifs: one a series of bulls eating from a manger, and the other a composite bull-antelope with long wavy horns facing a stylized pipal tree.

It is not, however, only the older urban civilizations that shed light on the Indus seal iconography, but also the likely continuities from Indus urban culture to the Dravidian village culture of South India. For not only is there the likelihood of linguistic continuities, but there is also archaeological evidence of cultural continuities from the Indus civilization, through Gujarat, to the Dravidian culture of the Deccan Plateau. Moreover, the urban models that the Indus cities provided during the Indus period not only reshaped village life in Indus times, but transmitted patterns that long outlived the Indus cities.

The Indus Valley stamp seals, found by the hundreds, confirm impressions gained from the terracotta figurines, most notably the tendency to accentuate female power in human form and male power through animal forms. But the situation with the seals is also more complex, as there are also humanized males and human-animal and even human-animal-plant composites of apparently both genders. Of single animals, many are drawn from nature: short-horned bulls, zebu, buffaloes, rhinoceroses, tigers, elephants, ante-

lopes, crocodiles. Composite human-animal forms reach such complexity as one with tiger hind quarters, ram forepart, bull horns, elephant trunk, and human face. Others show animal heads radiating from a central trunk.

The most frequently depicted seal animal is a “unicorn” bull or ox of generalized bovine traits with a single erect horn that faces an apparently sacred object, perhaps a brazier or incense burner. The unicorn’s horn is sometimes shown as a thin curved shaft crossed by lines that taper toward the tip, suggesting an affinity between animal and plant forms. Some of the naturally drawn animals also sometimes face simpler brazier or manger type objects. It is thus likely that “real” animals were linked with ritual symbols as well, and mythologically marked no less than the more clearly “mythic” figures like the composites, multicephalics, and unicorns.

It is the seals with humanoid figures, however, that take one beyond the general sense of mythic and ritual markers to evidence for a cult with a complex of sacrificial symbols. Females appear in various such scenes, but the most important are a series of scenes that portray a recurring ensemble involving goddesses, trees, tigers, and water buffaloes. Three seals show these interrelationships most dramatically. In one, a slender goddess with a crescent-shaped headdress kneels on a branch of a neem (*margosa*) tree, her arm outstretched toward a tiger below that turns its neck around to face her. The goddess’s position replicates a worshipping pose in other seals and suggests that she beckons the tiger with her outstretched arm. In the second seal, the goddess, now descended from the neem tree, stands behind the tiger about to seize it from the back. Yet both goddess and tiger are strikingly transformed. The goddess has assumed multiple traits of the water buffalo: Along with filling out the stylized crescent horns, her legs and feet have become flanks and hoofs and her ears pointed and flapped. Meanwhile, the tiger has sprouted horns that replicate the serrated V branch and leaf pattern of the neem, which now stands behind the goddess.

These two seals seem to suggest that the goddess has her primary affinity with the buffalo, and an opposition to the tiger. But a third seal shows a fusion of the goddess and the tiger, joined together so that the goddess retains a standing human form as the forepart of a tiger’s body that extends back from her hips and rear. Here, where the goddess’s affinity is with the tiger, she has wavy ram’s horns rather than buffalo-like horns. There is thus the suggestion that while the goddess has affinities with both the tiger and the buffalo, the two animals themselves remain in an oppositional and unfused tension.

This sense of a tiger-buffalo opposition is further reinforced in the so-called proto-Śiva seal from Mohenjo-Daro. But before discussing this seal, one should observe the primary seal evidence for a connection between the transformational themes that link the goddess to these and other animals and to a sacrificial cult. Clearest in this regard is the so-called ritual seal from Harappa depicting a goddess in the U-shaped twin branches of a stylized pipal tree, which rises

from a circular platform base or altar. The goddess has crescent buffalo-like horns and a pony tail like the goddess who descends toward the tiger from the neem. But her horns have a third central peak, and she does not have the hind legs or hoofs of the buffalo. Standing at rest, her bangled arms loose at her sides, she observes a horned and pony-tailed figure much like herself kneeling at the base of the pipal in the same “suppliant” posture that the goddess in the neem adopts toward the tiger. The kneeling suppliant has led before the goddess in the pipal a composite animal with buffalo hind quarters, ram horns and forepart, and a large masklike human face. Seven figures in thigh-length tunics, single backward-curving horns, pigtails, and bangled arms stand or possibly file before this scene, which clearly depicts the essentials of a sacrifice. The horned goddess is the recipient of an offering, its composite nature no doubt representing something of the range of victims she receives: the ram, buffalo, and the human face. Whether all are real offerings, or the human face solely symbolic, cannot be ascertained.

The kneeling figure making the offering in the “ritual seal” has an intermediate status between the horned goddess whose dress he affects and the composite human-animal he offers. The precise nature of his sacrificial role eludes researchers. But it is striking that the combination of elements that the seals configure remain coherent in the setting of still-current South Indian village rituals. In that Dravidian context, the neem, a female tree, is itself a form of the goddess. It is linked to her fierce side, and more specifically to the forms she takes to “cool” and thus overcome violent forces like smallpox, fevers, and various demons. The pipal, on the other hand, is the male tree the goddess marries, so the two trees will be planted to actually intertwine. It is highly suggestive that while the seal goddess on the neem branch descends to overcome the fierce and *wild* tiger, the goddess in the pipal stands tranquilly in a position to receive as a sacrifice the composite of human and *domesticated* animals that would seem to reflect the range of her regular cult.

Since the discovery of the Indus civilization, the one seal most central to a succession of different interpretations of the religion has been the so-called proto-Śiva seal from Mohenjo-Daro. This designation, however, now appears to have been based on a combination of misattributions: most notably the “three heads” that actually outline the dewlap of a buffalo face, and the “trident” headdress that actually consists of buffalo horns enclosing a central fan-shaped and stylized tree or sheaf of grain reminiscent of the tree-and-horns headpiece worn by Elamite and Sumerian priests. Moreover, above this “mitre” is what looks like a stylized pipal tree. The main figure is thus a humanlike water buffalo with a buffalo head and horns, axially centered on representations of a plant and/or tree. He sits with his knees out to the side and his feet drawn in below an erect phallus. The posture has usually been identified as yogic, though it is also reminiscent of the posture of the androgynous bovine seated in the pose of the goddess on an Elamite seal. Possibly the series of V-shaped

stripes that end at his waist—sometimes regarded as necklaces—represent tiger stripes, making him a figure in whom the tiger-buffalo tension finds a resolution in a yogic or more likely regally dominant self-discipline.

The central buffalo figure in the “proto-Śiva” seal seems to be the male counterpart to the goddess, who herself combines both tiger and buffalo attributes in various transformational modes. But in this male figure, what remains tense and dynamic in the goddess seems to find poise, dominance, and resolution. This is especially suggestive in view of the four animals that surround him, for the tiger and buffalo appear among these along with the elephant and rhinoceros. By analogy with later Indian iconographies, the four together are likely to have had a directional symbolism: the elephant linked with the east, the rhino with the west, the tiger with the north, and the buffalo with the south. Most strikingly, while the elephant and rhinoceros appear indifferent to each other, both facing east, the tiger and buffalo, which most directly flank the buffalo-man’s horns, face each other in a state that has the look of combative arousal. Furthermore, a stick figure appears over the back of the charging tiger: possibly a form of the goddess herself.

Of the four “wild” animals on the seal, two—the elephant and water buffalo—are susceptible to some degree of domestication even though they retain their “wild” traits. There is some evidence that elephants were captured and trained for heavy forest work during the Indus period, and it is likely that domestication of the water buffalo for agricultural use in the river valley was one of the major achievements of the Indus civilization, complementing the village cultures’ earlier domestication of the zebu in the highlands. It is significant that the water buffalo played the main symbolic role in Indus urban culture instead of the zebu, despite the latter’s longstanding economic importance. This suggests that the buffalo had a critical role in the riverine agriculture on which the Indus system was based, and that it symbolized the control of both nature and culture that made urban civilization possible.

The central water buffalo figure on the proto-Śiva seal seems to have the same general symbolic meaning of power-under-control as does the bull in Mesopotamian symbolism, and like the latter it probably also represents the king or ruling authority. Because the figure is male, it may be assumed that the Indus rulers also were male, as the few examples of portrait sculpture at Mohenjo-Daro suggest. There is little doubt, however, that the Indus people considered the goddess to be the real power and the ruler only her surrogate, empowered by her and thus responsible to her and for her. This is certainly consistent with the symbolism of the seal, where the central figure seems to bring into a regulated and authoritative image the various forces that the goddess oversees: agriculture, animal sacrifice, and the dangerous forces associated with the truly wild regions beyond the domain of civilization.

What kind of authority—priestly, political, economic—this figure represented still remains uncertain. The urban background of the ritual complex on the platform mound leaves all these possibilities open, and the distinctively Indian features of Indus symbolism make it risky to explain the Indus civilization on the basis of other urban cultures, even the closely related proto-Elamite culture. There is little doubt, however, that Indus Valley religion played a major role in establishing and maintaining that authority, and there is even less doubt that sacrifices to the goddess were the primary form of cultic practice. All of the external evidence—earlier village cultures, contemporary and related western Asian urban cultures, and later Dravidian culture—points to this conclusion, and the Indus evidence seems to confirm it.

CONCLUDING OBSERVATIONS. Taking the evidence as a whole, it is possible to construct a model of Indus Valley religion that explains its major known features and its place in the Indus civilization. The central element was certainly worship of the goddess at both the domestic and public levels, with corresponding levels of cultic practice. At the domestic level, votive sacrifices involving figurines were the likely form of worship, with a related emphasis on bathing and ritual purity. At the public level, represented by the raised platform mounds, worship must have involved more powerful blood sacrifices.

Mohenjo-Daro seems to have been the major cultic center for the system as a whole and the site for the most important sacrifices. Indus symbolism and later Dravidian practice point toward water buffalo sacrifices as the most important cultic rituals. The buffalo is the husband of the goddess in Dravidian cult sacrifices, and on Indus seals he appears as both the goddess’s surrogate and the symbol of centralized rule; it is likely that Indus cultic practice involved these elements, at least on major ceremonial occasions, but there is no direct evidence for how this might have been conceptualized.

The interpretation of Indus Valley religion cannot proceed beyond such speculation at the present time. Much has been learned about the Indus civilization since its discovery in the 1920s, and the pattern of Indus Valley religion is beginning to emerge from the growing body of data, but there are still many gaps to fill. The major task, moreover, has hardly begun: to trace the contributions of the Indus system to later Indian religious developments and to understand the place of the Indus system in the larger pattern of religious history.

BIBLIOGRAPHY

The most useful single source on village cultures and urbanization in Turkmenistan and western India is S. P. Gupta’s *Archaeol-*

ogy of Soviet Central Asia and the Indian Borderlands, vol. 2 (Delhi, 1979), which presents a judicious overview of the archaeological evidence and current interpretive theories. An assessment of the archaeological data from Turkmenistan sites is provided by the Soviet prehistorians V. M. Masson and V. I. Sarianidi in *Central Asia: Turkmenia before the Achaemenids* (London, 1972), edited and translated by Ruth Tringham and published initially in English as volume 79 of the "Ancient Peoples and Places" series. The best and most comprehensive survey of cultural development in India from earliest times through the establishment of Indus urban culture is Walter A. Fairservis, Jr.'s *The Roots of Ancient India*, 2d rev. ed. (Chicago, 1975), which examines the relevant evidence from all of the regional village cultures, discusses the factors that led to urbanization, and describes the basic features of the Indus civilization. The most accessible summary of the evidence from Mehrgarh is Jean-François Jarrige and Richard H. Meadow's "The Antecedents of Civilization in the Indus Valley," *Scientific American* 243 (August 1980): 122–133.

A variety of data on proto-Elamite religion is available in *A Survey of Persian Art*, edited by Arthur U. Pope and Phyllis Ackerman (1938–1939; reprint, London, 1964–1965), especially in the sections by Phyllis Ackerman on cult figurines and early seals (vol. 1, chaps. 11 and 14, and accompanying plates in vol. 7). A summary of Elamite history, culture, and religion is provided in Walther Hinz's *The Lost World of Elam: Recreation of a Vanished Civilization* (New York, 1973). Diane Wolkstein and Samuel Noah Kramer's *Inanna: Queen of Heaven and Earth* (New York, 1983) supplements what is known of Elamite goddesses with a comprehensive portrait of the closely related Sumerian goddess Inanna. The argument for a common origin of the proto-Elamite and proto-Dravidian languages is presented in David W. McAlpin's *Proto-Elamo-Dravidian: The Evidence and Its Implications* (Philadelphia, 1981). The significance of the Elamite trading center at Tepe Yahya for understanding interregional contacts in West Asia is discussed in Carl C. Lamberg-Karlovsky and Martha Lamberg-Karlovsky's "An Early City in Iran," *Scientific American* 224 (June 1971), and in Carl C. Lamberg-Karlovsky's "Trade Mechanisms in Indus-Mesopotamian Interrelationships," *Journal of the American Oriental Society* 92 (1972).

Data from the early excavations at Mohenjo-Daro are contained in John Marshall's *Mohenjo-Daro and the Indus Civilization*, 3 vols. (London, 1931), and E. J. Mackay's *Further Excavations at Mohenjo-daro*, 2 vols. (New Delhi, 1938). A valuable synthesis and interpretation of Indus evidence is presented in Mortimer Wheeler's *The Indus Civilization*, 3d ed. (Cambridge, U.K., 1968), and in his *Civilizations of the Indus Valley and Beyond* (London, 1966). A survey of Indus data up to the mid-1970s is provided in Walter A. Fairservis, Jr.'s *The Roots of Ancient India* (Chicago, 1975), supplemented by his *Allahdino I: Seals and Inscribed Material* (New York, 1976). Many of the most important contributions to the ongoing study of the Indus civilization are found in two volumes edited by Gregory L. Possehl: *Ancient Cities of the Indus* (New Delhi, 1979) and *Harappan Civilization: A Contemporary Perspective* (New Delhi, 1982). Possehl's own initial work on Indus culture in Gujarat is presented in his *Indus Civilization in Saurashtra* (Delhi, 1980).

Understanding Indus Valley religion has been a concern of investigators since Marshall and Mackay offered their first tentative interpretations, and the issue receives significant attention in the cited works by Wheeler and Fairservis. Indus seals in particular have been studied for clues to Indus religious concepts, with the so-called proto-Šiva seal receiving the greatest interest. A major new interpretation of the symbolism on this seal is found in Alf Hiltebeitel's "The Indus Valley 'Proto-Šiva,' Reexamined through Reflections on the Goddess, the Buffalo, and the Symbolism of *vabanas*," *Anthropos* 73 (1978): 767–797. Earlier interpretations of this seal and of other supposedly related Indus data are challenged in Doris Srinivasan's "Unhinging Šiva from the Indus Civilization," *Journal of the Royal Asiatic Society* (1984 pt. 1): 77–99. New insights into the meaning of Indus seals, especially those dealing with goddess-and-tiger motifs, are presented in Pupul Jayakar's *The Earthen Drum: An Introduction to the Ritual Arts of Rural India* (New Delhi, 1980), a beautifully illustrated book that interprets Indus religious data by drawing comparisons with the art and religious practices of later Indian folk traditions.

INITIATION: AN OVERVIEW

The term *initiation* in the most general sense denotes a body of rites and oral teachings whose purpose is to produce a radical modification of the religious and social status of the person to be initiated. In philosophical terms, initiation is equivalent to an ontological mutation of the existential con-

dition. The novice emerges from his ordeal a totally different being: he has become “another.” Generally speaking, there are three categories, or types, of initiation.

The first category comprises the collective rituals whose function is to effect the transition from childhood or adolescence to adulthood, and which are obligatory for all members of a particular society. Ethnological literature terms these rituals “puberty rites,” “tribal initiation,” or “initiation into an age group.”

The other two categories of initiation differ from puberty initiations in that they are not obligatory for all members of the community; indeed, most of them are performed individually or for comparatively small groups. The second category includes all types of rites of entering a secret society, a *Bund*, or a confraternity. These closed societies are limited to one sex and are extremely jealous of their secrets. Most of them are male, constituting secret fraternities (*Männerbünde*), but there are also some female societies. However, in the ancient Mediterranean and Near Eastern world, such sites, or “mysteries,” were open to both sexes. Although they differ somewhat in type, we can still classify the Greco-Oriental mysteries as secret confraternities.

Finally, there is a third category of initiation, the type that occurs in connection with a mystical vocation. On the level of archaic religions, the vocation would be that of the medicine man or shaman. A specific characteristic of this third category is the importance of personal experience. Initiation in secret societies and those of the shamanic type have a good deal in common. What distinguishes them in principle is the ecstatic element, which is of greatest importance in shamanic initiation. Despite their specialized uses, there is a sort of common denominator among all these categories of initiation, with the result that, from a certain point of view, all initiations are much alike.

PUBERTY RITES. The tribal initiation introduces the novice into the world of spiritual and cultural values and makes him a responsible member of society. The young man learns not only the behavior patterns, techniques, and institutions of adults but also the myths and the sacred traditions of the tribe, the names of the gods, and the history of their works; above all, he learns the mystical relations between the tribe and supernatural beings as those relations were established at the beginning of time. In a great many cases, puberty rites, in one way or another, imply the revelation of sexuality. In short, through initiation, the candidate passes beyond the “natural” mode of being—that of the child—and gains access to the cultural mode; that is, he is introduced to spiritual values. Often, on the occasion of the puberty rites the entire community is religiously regenerated, for the rites are the repetitions of operations and actions performed by supernatural beings in mythical time.

Any age-grading initiation requires a certain number of more or less dramatic tests and trials: separation from the mother, isolation in the bush under the supervision of an in-

structor, interdiction against eating certain vegetable or animal foods, knocking out of an incisor, circumcision (followed in some cases by subincision), scarification, and so forth. The sudden revelation of sacred objects (bull-roarers, images of supernatural beings, etc.) also constitutes an initiatory test. In many cases, the puberty initiation implies a ritual “death,” followed by a “resurrection” or a “rebirth.” Among certain Australian tribes the extraction of the incisor is interpreted as the neophyte’s “death,” and the same significance is even more evident in the case of circumcision. The novices isolated in the bush are likened to ghosts: they cannot use their fingers and must take food directly with their mouths, as the dead are supposed to do. Sometimes they are painted white, a sign that they have become ghosts. The huts in which they are isolated represent the body of a monster or a water animal: the neophytes are considered to have been swallowed by the monster, and they remain in its belly until they are “reborn” or “resuscitated.” The initiatory death is interpreted either as a *descensus ad inferos* or as a *regressus ad uterum*, and the “resurrection” is sometimes understood as a “rebirth.” In a number of cases, the novices are symbolically buried, or they pretend to have forgotten their past lives, their family relations, their names, and their language, and must learn everything again. Sometimes the initiatory trials reach a high degree of cruelty.

SECRET CULTS. Even on the archaic levels of culture (for example, in Aboriginal Australia), a puberty initiation may entail a series of stages. In such cases sacred history can be revealed only gradually. The deepening of the religious experience and knowledge demands a special vocation or an outstanding intelligence and willpower. This fact explains the emergence both of the secret cults and of the confraternities of shamans and medicine men. The rites of entrance into a secret society correspond in every respect to those of tribal initiations: seclusion, initiatory tests and tortures, “death” and “resurrection,” bestowal or imposition of a new name, revelation of a secret doctrine, learning of a new language. A few innovations are, however, characteristic of the secret societies: among these are the great importance attached to secrecy, the particular cruelty of initiatory trials, the predominance of the ancestors’ cult (the ancestors being personified by masks), and the absence of a supreme being in the ceremonial life of the group. In the *Weiberbünde*, or women’s societies, the initiation consists of a series of specific tests, followed by revelations concerning fertility, conception, and birth.

Initiatory “death” signifies both the end of the “natural,” acultural man and the passage to a new mode of existence, that of a being “born to the spirit,” that is, one who does not live exclusively in an immediate reality. Thus the initiatory “death” and “resurrection” represent a religious process through which the initiate becomes “another,” patterned on the model revealed by gods or mythical ancestors. In other words, one becomes a real man to the extent that one resembles a superhuman being. The importance of initiation for the understanding of the archaic mind centers es-

essentially in the fact that it shows that the real man—the spiritual one—is not automatic, is not the result of a natural process. He is “made” by the old masters, in accordance with the models revealed by divine beings in mythical times. These old masters form the spiritual elite of archaic societies. Their main role is to transmit to the new generations the deep meaning of existence and to help them assume the responsibility of real men, and hence to participate actively in the cultural life of the community. But because culture means, for archaic and traditional societies, the sum of the values received from supernatural beings, the function of initiation may thus be summarized: it reveals to every new generation a world open to the transhuman; a world, one may say, that is transcendental.

SHAMANS AND MEDICINE MEN. As for shamanic initiations, they consist in ecstatic experiences (e.g., dreams, visions, trances) and in an instruction imparted by the spirits or the old master shamans (e.g., shamanic techniques, names and functions of the spirits, mythology and genealogy of the clan, secret language). Sometimes initiation is public and includes a rich and varied ritual; this is the case, for example, among the Buriats of Siberia. But the lack of a ritual of this sort in no way implies the absence of an initiation; it is perfectly possible for the initiation to be performed in the candidate’s dreams or ecstatic experiences. In Siberia and Central Asia the youth who is called to be a shaman goes through a psychopathic crisis during which he is considered to be tortured by demons and ghosts who play the role of the masters of initiation. These “initiatory sicknesses” generally contain the following symbolic elements: (1) torture and dismemberment of the body, (2) scraping of the flesh and reduction to a skeleton, (3) replacement of organs and renewal of blood, (4) a sojourn in the underworld and instruction by demons and the souls of dead shamans, (5) an ascent to heaven, and (6) “resurrection,” that is, access to a new mode of being, that of a consecrated individual capable of communicating personally and directly with gods, demons, and souls of the dead. A somewhat analogous pattern is to be found in the initiations of Australian medicine men.

The little we know about Eleusis and the initiations in the Hellenistic mysteries there indicates that the central experience of the initiand (*mustēs*) depended on a revelation concerning the death and resurrection of the divine founder of the cult. Thanks to this revelation, the *mustēs* acceded to another, superior mode of being, and concurrently secured for himself a better fate after death.

THE MEANING OF INITIATORY ORDEALS. In many puberty initiations, the novices must not go to bed until late in the night (see some examples in Eliade, 1958, pp. 14–15). This initiatory ordeal is documented not only among nonliterate cultures (e.g., Australia, coastal California, Tierra del Fuego) but even in highly developed religions. Thus, the Mesopotamian hero Gilgamesh crosses the waters of death to find out from Utanapishtim how he can gain immortality. “Try not to sleep for six days and seven nights!” is the answer. But Gil-

gamesh at once falls asleep, and Utanapishtim wakes him on the seventh day. Indeed, not to sleep is not only a victory over physical fatigue but is above all a demonstration of will and spiritual strength; to remain awake is equivalent to being conscious, present in the world, responsible.

Another puberty initiation ordeal is the interdiction against eating for a few days, or against drinking water except by “sucking it through a reed” (Australia, Tierra del Fuego). Among some Australian tribes, the dietary prohibitions are successively removed as myths, dances, and pantomimes teach the novices the religious origin of each kind of food. But most puberty ordeals are cruel and terrifying. In Africa, as in Australia, circumcision is equivalent to death; the operators, dressed in lion and leopard skins, attack the novices’ genital organs, indicating that the intention is to kill them. In the Kongo or the Loango coast, boys between ten and twelve years old drink a potion that makes them unconscious. They are then carried into the jungle and circumcised. Among the Pangwe, the novices are taken to a house full of ants’ nests and are badly bitten; meanwhile, their guardians cry, “You will be killed; now you must die!” (See examples in Eliade, 1958, pp. 23ff., 30ff.) Excesses of this kind sometimes result in the death of the boy. In such cases the mother is not informed until after the period of segregation in the bush; she is then told that her son was killed by the spirit, or that, swallowed by a monster with the other novices, he did not succeed in escaping from its belly.

The assimilation of initiatory tortures to the sufferings of the novices in being swallowed and digested by the monster is confirmed by the symbolism of the cabin in which the boys are isolated. Often the cabin represents the body or the open maw of a water monster, a crocodile, for example, or of a snake. In some regions of Ceram the opening through which the novices pass is called the snake’s mouth. Being shut up in the cabin is equivalent to being imprisoned in the monster’s body. On Rooke Island (Umboi), when the novices are isolated in a cabin in the jungle, a number of masked men tell the women that their sons are being devoured by a terrifying, demonic being. In New Guinea, the house built for the circumcision of the boys has the form of the monster Barlun, who is believed to swallow the novices; that is, the building has a “belly” and a “tail.” The novice’s entrance into the cabin is equivalent to entering the monster’s belly. Among the Nor-Papua the novices are swallowed and later disgorged by a spirit whose voice sounds like a flute. The initiatory cabin represents not only the belly of the devouring monster but also the womb. The novice’s “death” signifies a return to the embryonic state.

It is in the interval between initiatory “death” and “resurrection” that the Australian novice is gradually introduced to the sacred history of the tribe and is permitted to witness, at least in part, its pantomimes and ceremonial dances. Learning the myths of origins, that is, learning how things came into existence, the novice discovers that he is the creation of supernatural beings, the result of a specific primordi-

al event, the consequence of a series of mythological occurrences, in short, of a sacred history. Such revelations, received through the ordeals of a ritual “death,” characterize most of the age-grading initiations. The “resurrection,” or “rebirth,” proclaims the coming into being of a new person: an adult aware of his religious condition and of his responsibilities in the world.

FROM TRIBAL INTIATION TO SECRET CULT. Female puberty initiations are less widespread than boys’ initiations, although they are documented in the ancient stages of culture (Australia, Tierra del Fuego, and elsewhere). The rites are less developed than those for boys’ initiations. Furthermore, girls’ initiations are individual; that is, they begin with the first menstruation. This physical symptom, the sign of sexual maturity, compels a break—the young girl’s separation from the community. The length of the girl’s segregation varies from culture to culture: from three days (in Australia and India) to twenty months (New Zealand), or even several years (Cambodia). Consequently, in many parts of the world, the girls do in the end form a group, and then their initiations are performed collectively, under the direction of their older female relatives (as in India) or of other old women (Africa). These tutors instruct them in the secrets of sexuality and fertility and teach them the customs of the tribe and at least some of its religious traditions—those accessible to women. The instruction is general, but its essence is religious: it consists in a revelation of the sacrality of women. The girl is ritually prepared to assume her specific mode of being, that is, to become a “creator of life,” and at the same time is taught her responsibilities in society and in the world—responsibilities that are always religious in nature.

Among some peoples, there are several degrees of female initiation. Thus, among the Yao of Thailand initiation begins with the first menstruation, is repeated and elaborated during the first pregnancy, and is only concluded with the birth of the first child. There are also a number of women’s cult associations, most probably created under the influence of the male secret societies. Some African female secret associations include masculine elements (for instance, the directress, symbolizing a leopard, attacks and “kills” the novices; finally they “kill” the leopard, and free the novices from its belly). Among the Mordvins of Russia there existed a secret women’s society whose emblem was a hobbyhorse and whose members were called “horses.” But such masculine influences have been exercised chiefly on the external organization of female societies. (On female intiations, see Eliade, 1958, pp. 44ff., 78ff., and especially Lincoln, 1981.)

The morphology of men’s secret societies is extremely complex, and their origin and history are still obscure. But there is a continuity between puberty rites and rites of initiation into men’s secret societies. Throughout Oceania, for example, both initiations of boys and those requisite for membership in the men’s secret societies involve the same ritual of symbolic death through being swallowed by a sea monster, followed by resurrection—which indicates that all the cere-

monies derive historically from a single center. In West Africa, we find a similar phenomenon: the secret societies derive from the puberty initiations. (For other examples, see Eliade, 1958, pp. 73ff., 153.)

The socioreligious phenomenon of secret male cults and masked confraternities is especially widespread in Melanesia and Africa. As in the tribal initiations, the rites for entrance into men’s secret cult societies present the well-known pattern: seclusion, initiatory ordeals and tortures, revelation of a secret doctrine, bestowal of a new name, instruction in a special language.

In the two American continents, the climbing of a tree or a sacred pole plays an important role not only in puberty initiations (as, for example, in the north of the Gran Chaco, and among the Mandan, the Kwakiutl, and the Pomo) but also in public festivals (the Festival of the Sun held by the Ge; various festivals among the Tupi, the Plains Indians, the Salish, the Delaware, the Maidu), or in the ceremonies and healing séances of shamans (Yaruro, Araucanian, Maidu). The climbing of the tree or of the sacred pole has the same goal: to meet with the gods or heavenly powers in order to obtain a blessing, whether a personal consecration, a favor for the community, or the cure of a sick person.

MARTIAL AND HEROIC INITIATIONS. In ancient Greece, some heroic scenarios can be identified in the saga of Theseus; for example, his ritual descent into the sea (an ordeal equivalent to a journey into the beyond) or his entering the labyrinth and fighting the monster. Other initiatory ordeals survived in the famous Spartan discipline of Lykurgos, under which an adolescent was sent away to the mountains, naked, to live for a full year on what he could steal, being careful to let no one see him. In other words, Lacedaemonian youths led the life of a wolf for a whole year.

Among the ancient Germans, a young man had to confront certain ordeals typical of the initiations of warriors. Tacitus tells us that among the Chatti the candidate cut neither his hair nor his beard until he had killed an enemy. A Taifali youth had to bring down a boar or a wolf; among the Heruli, he had to fight unarmed. Through these ordeals, the young man took to himself a wild animal’s mode of being; he became a dreaded warrior in the measure in which he behaved like a beast of prey. Such warriors were known as berserkers, literally, “in shirts (*serkr*) of bear,” or as *úlfhednar*, “men with the skin of a wolf.” They thought that they could metamorphose themselves into wolves by the ritual donning of a wolfskin. By putting on the skin, the initiand assimilated the behavior of a wolf; in other words, he became a wild-beast warrior, irresistible and invulnerable. “Wolf” was the appellation of the members of the Indo-European military societies.

The martial initiatory ordeal *par excellence* was the single combat, conducted in such a way that it finally roused the candidate to the “fury of the berserkers.” The ancient Germans called this sacred force *wut*, a term that Adam of Bre-

men translated as *furor*; it was a sort of demonic frenzy, which filled the adversary with terror and finally paralyzed him. The Irish *ferg* (lit., “anger”) is an almost exact equivalent of this same terrifying sacred experience, specific to heroic combat.

The initiation of the youthful hero Cú Chulainn admirably illustrates such tumultuous and burning “fury.” While still a little boy, Cú Chulainn asked his uncle, the king of Ulster, for arms and a chariot, and set off for the castle of his uncle’s three famous adversaries. Although those heroes were supposed to be invincible, the little boy conquered them and cut off their heads. But the exploit heated him to such a degree that a witch warned the king that if precautions were not taken, the boy would kill all the warriors in Ulster. The king sent a troop of naked women to meet Cú Chulainn, and the lad hid his face, that he might not see their nakedness. Thus they were able to lift him from the chariot and place him in successive vats of cold water to extinguish his wrath (*ferg*). The first vat burst its staves and its hoops; the next boiled with big bubbles; “the third vat into which he went, some men might endure it and others not. Then the boy’s *ferg* went down, and his garments were put on him” (*Táin Bó Cuailnge*, trans. Joseph Dunn, London, 1914, pp. 60–78).

INITIATION IN THE CHRISTIAN AND WESTERN WORLD. Initiatory scenarios can be recognized in many medieval and postmedieval religious, mystical, and esoteric groups, some, but not all of them, considered heretical by the ecclesiastical authorities. The matter is too complex, and as yet insufficiently researched, to permit a brief summary. Still, throughout almost all of rural Europe, and down to the end of the nineteenth century, the ceremonies marking the passage from one age class to the next still reproduced certain themes characteristic of traditional puberty initiations. Furthermore, the symbols and rituals of a secret society can be recognized in the military organizations of youth: the ordeals of their entrance, their peculiar dances (for example, the Scottish sword dance), and even their costumes. Also, the ceremonial of the artisans’ guilds has an initiatory pattern, especially among the blacksmiths and masons. Finally, the closed milieu of the alchemists contained many recognizable elements; indeed, the *opus alchymicum* implies the well-known pattern of initiation: tortures, “death,” and “resurrection” (Eliade, 1978, pp. 142ff.).

It is significant that in medieval and postmedieval times, some initiatory patterns were conserved in the oral as well as written literatures, for instance, in folk tales, in the Arthurian cycle, in the neo-Greek epic *Digenis Akritas*, in the ecstatic poems of *Fedeli d’amore*, and even in certain children’s games (see some examples in Eliade, 1958, pp. 124ff.; Eliade, 1969, pp. 120ff.). No less significant is the survival of initiatory scenarios in many pre-Romantic and Romantic novels, from Goethe’s *Wilhelm Meister* to Balzac’s *Séraphita*. With regard to the initiatory rituals practiced by the various secret associations of the same period, only that of Freemasonry

seems to prolong an authentic tradition. Most other secret groups are recent creations, and their initiation rites were either constructed by their founders or inspired by certain esoteric literature. The same phenomenon of improvising secret associations with more or less complicated initiatory ordeals continued into the twentieth century (see Eliade, 1976, pp. 58ff.).

But such pseudo-initiatory improvisations have a religious significance. In recent times, literary critics have recognized initiation themes in much modern European and American literature; Nerval (*Aurélia*), Jules Verne (*Voyage au centre de la terre, L’île mystérieuse*), T. S. Eliot (*The Waste Land*), and many other contemporary writers, such as Sherwood Anderson, F. Scott Fitzgerald, Thomas Wolfe, and William Faulkner, have made use of this notation (see Eliade, 1969, pp. 123ff.). Other authors have deciphered initiatory scenarios in contemporary plastic arts and especially in cinema. Thus, in the modern Western world, initiatory symbols have survived on the unconscious level (i.e., in dreams and imaginary universes). It is significant that these survivals are studied today with an interest difficult to imagine sixty or seventy years ago. In the desacralized Western world, the sacred is present and active chiefly in the realms of the imaginary. But imaginary experiences are part of the total human being, no less important than his diurnal experiences. This means that the nostalgia for initiatory scenarios, a nostalgia deciphered in so many literary and artistic creations, reveals modern man’s longing for a total and definitive renewal, for a *renovatio* capable of radically changing his existence.

Allen’s *Male Cults and Secret Initiations in Melanesia* (London, 1967), an exemplary analysis of initiation ceremonies in New Guinea; *Secret Societies*, edited by Norman MacKenzie (New York, 1967); *Classes et associations d’âge en Afrique de l’Ouest*, edited by Denise Paulme (Paris, 1971); and Robert S. Ellwood Jr.’s *Religious and Spiritual Groups in Modern America* (Englewood Cliffs, N.J., 1973). On the initiation pattern among alchemists, see my *The*

Forge and the Crucible, 2d ed. (Chicago, 1978). For a discussion of initiatory ordeals among secret societies improvised in this century, see my *Occultism, Witchcraft, and Cultural Fashions: Essays in Comparative Religions* (Chicago, 1976).

MIRCEA ELIADE (1987)

INITIATION: MEN'S INITIATION

The word *initiation* implies a new beginning, as the Latin *initium* suggests. By means of a rite of passage or transition, a person is separated from one social or religious status and incorporated into another. From a religious perspective, initiation may be seen as an encounter with the sacred. The transition is therefore a profound one, with the initiand emerging from the passage changed not only socially but existentially and spiritually as well. This radical transformation is almost universally symbolized by images of death and rebirth. One is not simply changed; one is made new.

The study of initiation in general, particularly in primitive society, has been almost synonymous with the study of men's initiation in particular. This situation exists, in part, because the vast majority of ethnologists, anthropologists, and even untrained observers were male and, therefore, had greater access to the secret rituals of their own sex. More germane, however, is the fact that male initiations are frequently given more importance, both social and religious, than female initiations. They are, in any event, usually more elaborate and therefore more conspicuous than their female counterparts. Men's initiation may be divided into three categories: puberty rites; specialized initiations into secret societies or confraternities; and specialized initiations into religious vocations or mystical careers.

PRIMITIVE PUBERTY RITES: METHODOLOGICAL APPROACHES. These invariably obligatory rituals effect the transition from childhood or adolescence to manhood. The boy is separated, often quite literally, from the world of women and children, emerging from his seclusion a man in the company of men. For the male, the arrival of biological puberty is not as punctuated an event as it is for the female. Male initiations are therefore largely cultural rather than biological transitions. Relatedly, boys are usually initiated in groups.

The nature and purpose of male puberty rites have been interpreted from three primary perspectives: history of religions, anthropology, and psychoanalytically oriented schools of psychology. Although they emphasize different aspects of the ritual, these approaches often complement rather than conflict with one another.

Historians of religion, most notably Mircea Eliade, are essentially concerned with interpreting the meaning of the ritual, particularly its symbols of transformation, such as death and rebirth. Historians of religion seek to make intelligible the existential moment experienced by the initiand himself. Their inquiry ranges well beyond primitive society in general and puberty rites in particular in an effort to dis-

cern universal patterns in initiation per se. As a consequence this approach is more concerned with cross-cultural symbols than it is with either the varying social frameworks in which those symbols appear or the structure of the rite as such.

By comparison, structure is a primary concern for the anthropologist. Beginning with Arnold van Gennep's *Rites of Passage* (1909), the "career" of the initiand has been analyzed from the perspective of its three basic stages: "separation" from one social status, "transition," and "incorporation" into another social status. Like Eliade, van Gennep clearly recognized the religious dimension of initiation in primitive society. Developing the views of van Gennep and Bronislaw Malinowski, contemporary anthropology concerns itself primarily with how the rite "functions" in primitive society. Its emphasis is, therefore, on how rites reinforce social values, maintain social stability, promote group solidarity, and provide needed instruction and psychological support for the individual.

Unlike Eliade and van Gennep, however, the contemporary social sciences regard initiation as an essentially secular activity. Concerning themselves almost exclusively with male initiation, they suggest that adolescent boys, because of their increasing prowess, strength, and sexual capacities, threaten the order of society and its social equilibrium. Puberty rites help socialize these individuals, thereby allaying their socially disruptive potential. Although theories that stress group solidarity are applicable in a primitive context, they often shed little light on individual initiations in post-primitive society.

Psychoanalytically oriented schools of psychology have shown great interest in men's puberty rites. In fact, it is only this particular aspect of primitive society that has attracted their attention. Using Freudian theory, particularly oedipal conflict and castration anxiety, as a starting point, most exponents of these schools concern themselves not with puberty rites in general but rather with ritual details such as circumcision.

PUBERTY RITES: PATTERNS AND ISSUES. From a cross-cultural standpoint, three comprehensive traits characterize male puberty rites in primitive society. First, as noted, is the structure of separation, transition, and incorporation. This scenario is frequently correlated with images of death and rebirth. Second is the disclosure of sacred knowledge, particularly mythical paradigms. Third is the performance of ritual operations on the body and the often related presence of ordeals.

Separation and incorporation/death and rebirth. As illustrated by Eliade, separation from childhood and the female realm is often dramatic and symbolized by death. In Australia, for example, mythical beings in the form of masked men snatch the boys from their mothers and "devour" them. The mothers mourn for the novices just as one mourns for the dead.

The transitional period between separation and incorporation is often prolonged, particularly in the elaborate ritu-

als afforded the male. This period, referred to as one of "liminality," has attracted increasing attention. The social anthropologist Victor Turner draws particular attention to the "liminal persona" as one that is neither this nor that, neither here nor there, but rather betwixt and between. The period of liminality is one of ambiguity and paradox. The initiand may be seen as neither living nor dead, but as both at the same time. Much of the symbolism accompanying this rite is accordingly bivalent. The hut in which the secluded initiand dwells, for example, symbolizes both devouring monster and generative womb, that is, both death and rebirth. During this period, the initiand is seen as pure possibility or primal totality. Males are often dressed as females, thus representing androgyne. Again, they are neither male nor female, but both. The liminal persona is in many ways "invisible," living beyond the norms and categories of society. Traditional taboos and moral injunctions do not apply to him. Liminal personas are sacred, even dangerous. It is therefore often necessary that they be purified before reentering society.

Disclosure of knowledge and mythical paradigms.

Some scholars, particularly the psychoanalytically oriented, have suggested that little, if any, significant knowledge is imparted during initiation. Most other scholars, however, suggest that instruction is, in fact, central to the primitive rite. A more significant issue concerns the type of knowledge imparted. Sociologists emphasize instruction in behavior that will be appropriate to the new social status of the person. Historians of religion tend to emphasize the revelation of sacred myths and the true meaning of ritual objects. To a certain degree these two forms of knowledge are interrelated; it is through the myth that the initiand learns who he is and what he is to be. It is, however, the revelation of sacred myth and, relatedly, divine-human relations that require the ritual to be kept secret from women and the uninitiated. Almost always, it is the men only who receive instruction in these matters. Male initiation frequently takes place on a secluded and sacred ground to which women have no access. According to the myths in many cultures, it is on this very ground that the first initiation took place. Among the Kamilaroi of Australia, the sacred ground is the first camp of the All-Father, Baiame. The novices not only learn of mythical events, they reexperience them, returning to the primordial time when the first initiation took place.

Ritual operations and ordeal. Ritual operations on the body are widely performed during primitive puberty rites. The body may be cut, scarred, pierced, branded, or tattooed in innumerable ways, often with great ingenuity and artistic skill. The operation symbolizes differentiation from uninitiated individuals as well as permanent incorporation in a new group. Particularly painful operations, along with harsh treatment, tests of endurance, and other imposed hardships are common in all but the most archaic of male initiations. Invariably, such an ordeal symbolizes ritual death and has a mythological model.

Although van Gennep regarded genital operations as simply another form of bodily modification with no unique significance, circumcision in particular has attracted uncommon interest and generated great controversy. Circumcision of males at puberty is a widespread, if not universal, practice among archaic tribes. Many societies see it as equivalent to initiation itself and regard uncircumcised men as children. Mythologies and rituals of circumcision are generally dramatic; death symbolism is often conspicuous. The masters of initiation frequently portray mythical animals that seize and symbolically destroy the genitals of the novice. Like Freud himself, many psychoanalytically oriented scholars see in male puberty rites a ritual confirmation of Freudian theory. They regard circumcision as a symbolic form of castration and a primary means of generating castration anxiety within the adolescent male. The ritual act is seen as an ongoing repetition of a primal punishment imposed by a primal father on his rebellious sons. The ritual produces submission to the father's will and reinforces the taboo against incest. Adherents of this school regard ordeal as the essential aspect of the ritual and see instruction as insignificant or peripheral.

Far less prevalent than circumcision is the practice of subincision, whereby the undersurface of the penis is slit open. The initial cut is made some time after circumcision, but may be subsequently lengthened until the incision extends along the entire penile urethra. The wound is periodically opened and blood is drawn. Various explanations and interpretations have been offered. In certain cases, particularly where the incision is explicitly equated with a vulva, the intent of the rite is apparently to provide the male, in symbolic fashion, with both sex organs. The initiand takes on a bisexual or androgynous character, thereby emulating a divine totality. Relatedly, the blood periodically drawn from the reopened wound may symbolize menstrual blood. In Australia and elsewhere, blood is sacred, and males are often anointed with it during the initiation ritual.

The psychologist Bruno Bettelheim offers interpretations of both circumcision and subincision in primitive society. He observes that adolescent boys experience anxiety because they lack a clear biological confirmation of sexual maturity such as the female's first menstruation. Departing from mainstream Freudian theory, Bettelheim sees circumcision as a means of allaying rather than increasing anxiety. Circumcision, in effect, demonstrates to the boys their sexual maturity. Subconsciously at least, they desire it. Their anxiety alleviated, they can more easily adjust to their new social roles. Subincision, for Bettelheim, is rooted in the male's subconscious envy of the female, her sexual organs, and her reproductive ability. Such envy may be seen as the male counterpart of "penis envy" experienced by females, according to Freudian theory. The ritual of subincision creates a vagina; its periodic opening recreates menstruation; and the ritual, according to Bettelheim, helps the male master his envy of the opposite sex.

Despite evident differences, ritual homologues of the primitive puberty rite are found in every major religion: con-

firmation in Christianity, Upanayana in Hinduism, and bar mitzvah in Judaism, to name a few. This last-named rite will serve as a representative illustration. Properly speaking, the term *bar mitzvah* refers not to the ritual but rather to the initiand. On the day following his thirteenth birthday, the Jewish male becomes a “son of the commandments,” as the term suggests. Separated from religious and moral childhood, he is incorporated into a life of ethical responsibility and ritual obligation. He is incorporated, too, into the *minyan*, the ten persons necessary for the recital of public prayer. Of great importance is the first public reading of the Torah (the Pentateuch) by the initiand. This simultaneously demonstrates his religious knowledge and his place in the adult world. In many communities an examination was given prior to the ceremony. In certain traditional communities the boy is expected to present a *derashah*, or scholarly discourse on the Talmud (the collection of Jewish law and tradition), at the celebration that follows. The initiand's investiture with sacred objects is also central to the rite, as it was for the primitive youth. Having become a bar mitzvah, the male is obligated and permitted to wear the *tefillin*, two cubical leather boxes containing four biblical passages, expressing four basic precepts. The two containers, connected to leather thongs, are ritually bound to the arm and the forehead during recitation of the morning prayers. These boxes contain passages from the Pentateuch (*Dt.* 6:4–9; 11:13–21) requiring the Jew to “bind” the Law as a sign between the eyes and on the hand (arm). This the bar mitzvah now does literally and for the first time.

SPECIALIZED INITIATIONS. Religious man (*homo religiosus*) seeks an ever-increasing participation in the sacred. Initiations of a specialized nature are therefore appropriate. These rites are invariably voluntary. Particularly in primitive society, puberty rites enable the novice to fully enter the human condition. Specialized initiations, by comparison, enable the individual to transcend that condition. In primitive, classical, and modern society, specialized initiations for men may be divided into two categories: (1) initiation into secret societies or male confraternities and (2) initiations into religious vocations or mystical careers. These specialized initiations are morphologically similar to puberty rites. Patterns and motifs characteristic of primitive puberty rites reappear in specialized initiations, even those in classical and modern society.

Initiation into secret societies. Initiations into primitive secret societies or male confraternities tend to be more selective, more severe, more dramatic, and more secretive than puberty rites. Again, however, we find the ubiquitous symbols of death and rebirth or resurrection. The “mystery” cults of the ancient Greco-Roman world may clearly be regarded as secret societies. The Greek word *mysterion* indicates a rite performed only for initiates. Unlike the formalized state religions of the time, the “mysteries” afforded the worshiper a highly personal experience. Invariably the mysteries promised a resurrection or rebirth beyond the grave. This posthumous resurrection found its temporal equivalent and precondition in ritual rebirth. It was, in fact, at a highly

secret initiation during which sacred objects were revealed that this rebirth took place. Invariably, too, the triumph or rebirth of the initiand found its model in the paradigmatic victory of a god or celestial hero.

Although most Hellenistic “mysteries” were open to both sexes, there was one major exception. Mithraism, the secret cult surrounding the celestial Mithra, was open only to men. This confraternity, with its evidently masculine and austere emphasis, had a particular appeal for the soldiers of Rome. The paradigmatic myth relates how the lord Mithra sacrificed the primal bull. From its dying body and shed blood issued the bread and wine of a fecund earth. Plants and animals, too, sprang forth as new life issued from death. Relatedly, at the initiation rite, the new member was baptized in the blood of the dying bull, after which he shared a sacred meal of bread and wine. This ritual feast found its model in the original banquet celebrated by Mithra after the ritual slaying.

Just as Mithra ascended to heaven, passing through the seven planetary spheres, so too does the initiand pass through seven stages or grades of initiation. The seven ritual grades correspond also to the planetary journey of the initiand's own soul after death, winning for him immortality beyond the grave.

The initiatory process was characterized by test and ordeal, befitting the military and austere constituency of the confraternity. Although information here is obscure, it appears that the initiand was branded, subjected to extremes of heat and cold, and, with hands bound, possibly hurled across a pit. The use of crypts and tombs as sites of initiation clearly reinforced the death imagery. Initiation at the mysteries, including the Mithraic rite, was essentially concerned with effecting a personal transformation of the initiand rather than simply imparting information.

In the modern world, initiations into secret societies have become semireligious vestiges of their archaic counterparts. Although the actual experience of transcendence, sacredness, and renewal has become rare, the desire for it often remains. This is clear in modern Freemasonry. Initiation to the level of master mason will serve as a representative example. Although Freemasonry began as an institution in the seventeenth century, it has generated a mythology, or legendary history, according to which its origins are to be found in the biblical reign of Solomon and the building of his temple. According to this mythology, the master architect, Hiram Abiff, was slain by assailants just before the completion of the temple, because he refused to divulge the secrets of a master mason. His actions at that time constitute the paradigmatic gestures now reiterated and explained during the ritual of initiation. As he died, so now dies the initiand. A coffin, an open grave, or the depiction of a grave on the floor make this symbolically clear, as do the skull and crossbones surrounding it. The initiand is “lowered” into the grave from which he is, however, “resurrected,” symbolizing his rebirth and incorporation into the circle of master masons who assist

in the resurrection. The ordeal accompanying the ritual is essentially symbolic rather than real. Just as Hiram Abiff refused to divulge the secrets of a master mason to the uninitiated, so does the initiand now swear himself to secrecy under penalty of death. Not only are his knowledge of myth and symbol tested at this level, but higher levels of knowledge and interpretation are disclosed. The tools of the stonemason assume a sacred significance as ritual objects. Their symbolic significance, which invariably contains a moral message, is now disclosed.

Initiation into a religious vocation. A representative illustration is afforded by the Buddhist monk. Prior to the ordination proper, initiation into a probationary period takes place. This step, the *pravrajyā*, or “going out,” literally implies a “departure” or separation from the normal world. This initiation often takes place at the age of eight and, like the Upanayana in Hinduism, is a homologue of primitive puberty rites. In some Buddhist countries of Southeast Asia, the novice is sometimes so cut off from the world that no woman, not even his mother or sister, may approach him. Having attained the age of twenty and completed the probationary period, the novice undergoes ordination proper, or *upasampadā*. Here again, separation from the world and symbolic death are evident. In Laos, the women of the house ritually weep on the eve of the ordination, reminiscent of primitive practice. It is frequently the Buddha himself, leaving behind his world of pleasure, who provides the mythical and paradigmatic model for the ritual activity. In Cambodia, for example, the future monk, dressed in princely robes to represent the Buddha's preascetic life, rides toward the monastery amid the joyous cries of friends and relatives who represent the gods in their praise of the future Buddha. Others attempt to hinder the initiand's progress, just as Māra, the Buddhist devil, attempted to impede the future Buddha.

Ordination, or *upasampadā* is, however, literally an “arrival.” The initiand is very clearly “incorporated” into the body of monks, the Buddhist order, as is evident at the completion of the rite when the monks surround the newly ordained member, symbolizing refuge in the Buddha, his teachings, and the order itself. The exact moment at which the monks close in around the novice is carefully recorded, as his rebirth takes place and his new life begins at this time. The assumption of a new name is commonplace.

Many of the ordination activities find their model in the events that transpired at the council of Rājagṛha shortly after the Buddha's death. The participants at this council and their activities demonstrate a mythical quality. Just as Ānanda, the Buddha's favorite disciple, was tested by the early *arhats* or “enlightened ones,” so now is the novice tested and subjected to ordeal. Just as Ānanda did then, so must the initiand now confess his sins, be banished from the gathering, and then be permitted to return. In Tibet and elsewhere the initiand is presented with certain sacred objects such as robes and books.

The Roman Catholic rite (sacrament) of ordination to the priesthood also illustrates many traditional initiatory motifs. The rite is, however, public, as are its ritual equivalents (e.g., Buddhist ordination) in most modern religions. After a period of candidacy, the ordinand is examined, declared worthy, and presented to the bishop for election. Just as Jesus selected priests for his ministry, so is the ordinand now selected. The paradigmatic Jesus serves as model throughout the rite. He is referred to not only as teacher and shepherd, but also as priest. His paradigmatic death and rebirth-resurrection are continually evident. The bishop states in the revised rite: “In the memorial of the Lord's death and resurrection, make every effort to die to sin and to walk in the new life of Christ.”

Central to the rite is the “laying on” or “imposition of hands” by the bishop. Already in the Old Testament (*Nm.* 8:5–11), the tribe of Levi is “set apart” for service to God by this gesture. As the Latin *ordo* (a social body separate from the people at large) originally made clear, the priest is set apart or separated from the people by this rite. Yet, following the laying on of hands by the bishop, all the priests present lay their hands upon the ordinand. This ancient ceremonial is a symbol of incorporation, homologous to the Buddhist monks surrounding their new member. Like the Buddhist initiand, the Roman Catholic ordinand is “received into” an order.

After being anointed on the palms, the new priest is empowered to offer Holy Communion (the Eucharist) for the first time. The sacred objects are given him: a chalice of wine and a paten (silver plate) with the host (bread). Just as Jesus offered bread and wine, so now does the ordinand. In the Mass they become the body and blood of Christ; thus the last supper becomes a contemporary event and the Lord's death and resurrection are shared by the congregation.

BIBLIOGRAPHY

A pioneering work, now dated but still useful and interesting as an introduction, is Arnold van Gennep's *Les rites de passage* (Paris, 1909), translated by Monika B. Vizedom and Gabrielle L. Caffee as *The Rites of Passage* (Chicago, 1960). Hutton Webster's *Primitive Secret Societies*, 2d ed., rev. (1932; reprint, New York, 1968), is also a pioneering work, first published in 1908. It views secret societies from the perspective of their political power. Written by the noted historian of religions, Mircea Eliade, *Rites and Symbols of Initiation: The Mysteries of Birth and Rebirth* (New York, 1958) is the best overview of initiation in general and male initiation in particular. It confines itself largely but not exclusively to primitive society. *Initiation*, edited by C. Jouco Bleeker (Leiden, 1965), is a collection of essays in several European languages, including English. It represents various methodological approaches and deals with ritual in numerous religious traditions. The article by Eliade contains an excellent, even if now slightly dated, bibliography. John W. M. Whiting,

Richard Kluckhohn, and Albert Anthony's "The Function of Male Initiation Ceremonies at Puberty," in *Readings in Social Psychology*, edited by Eleanor E. Maccoby et al. (New York, 1958), is a frequently cited and stimulating article combining sociological and psychological theory. Frank W. Young's *Initiation Ceremonies: A Cross-Cultural Study of Status Dramatization* (Indianapolis, 1965) views the primitive rite from the perspective of its social function. Michael Allen's *Male Cults and Secret Initiations in Melanesia* (Melbourne, 1967) combines sociological and psychological perspectives and sees the rite as a means of reinforcing sexual identity. Bruno Bettelheim's *Symbolic Wounds: Puberty Rites and the Envious Male* (Glencoe, Ill., 1954) is a little classic. It is readable, controversial, even provocative, and in many ways superior to the sociological and psychological works that have followed it. For further information on Buddhist initiation, see Paul Lévy, *Buddhism: A "Mystery Religion"?* (New York, 1968).

WALTER O. KAELEBER (1987)

INITIATION: WOMEN'S INITIATION

Although rituals of women's initiation resemble in numerous ways those celebrated for men, there are also highly significant differences that reflect the biological and—more importantly—the social distinctions between men and women. For instance, it has often been noted that whereas males are usually initiated as a group, women's initiation is quite frequently performed separately for each individual. In part, this may result from the fact that a dramatic individual physiological event—the onset of menstruation—marks the moment at which women's initiation is to take place in many cultures. But one should also note that whereas strong sociopolitical solidarity is established among those males who are initiated together as a corporate group or age-set, the isolation of women in initiation reflects and helps perpetuate a situation in which females are not integrated into any broadbased, powerful, or effective sociopolitical unit.

The task of initiatory rituals is the making of an adult: the transformation of a child into a productive, responsible member of society, prepared to assume the rights and obligations of the particular status marked out for him or her by tradition. Within any ritual of women's initiation, one may thus expect to find encoded the expected norms of female existence as defined by a given society, for it is in that ritual that girls are led to adopt those norms, or—to put it differently—that those norms are imposed on each girl by society as a whole. Here, the observations of Simone de Beauvoir in *The Second Sex* (New York, 1961) are particularly appropriate: "One is not born, but rather becomes, a woman. No biological, psychological, or economic fate determines the figure that the human female presents in society; it is civilization as a whole that produces this creature, intermediate between male and eunuch, which is described as feminine" (p. 249).

Although women's initiation is widely practiced—statistical studies show it to be current among more of the world's peoples than its male counterpart—it has rarely re-

ceived the degree of attention directed toward men's corresponding rituals. In part, this unfortunate state of affairs may exist because male fieldworkers have been unable to gain admission to these ceremonies, or they may simply have been uninterested in making the attempt. Thus, only a few examples have been reported in any real detail, and still fewer subjected to thorough analysis. Some attempts have been made to draw conclusions from statistical surveys based on the Human Relations Area Files (New Haven), but the findings proposed—correlating performance of women's initiation with matrilineal residence patterns, for instance—have been called into serious question. The field remains largely unexplored, and more work is urgently needed.

Among the examples that have been most thoroughly reported and studied is the Nkang'a ritual of the Ndembu, witnessed by Victor and Edith Turner. This ceremony, which is performed for each Ndembu girl at the time when her breasts begin to develop, but before her menarche, consists of three stages that lead up to the initiand's marriage. The first of these phases, Kwing'ija ("causing to enter"), begins when the prospective bridegroom of the initiand exchanges arrows with the mother of his bride-to-be and also gives an arrow to a specially selected woman who will serve as the girl's instructress and who presides over her initiation. On the next day, dances are held for the girl by the women of her village (men being for the most part excluded) at a consecrated *mudyi* tree just outside the village. The *mudyi* tree, which is the focus of this day's rituals, has strong symbolic associations to numerous referents; among these are the central Ndembu principle of matrilineal descent, the relation of mother and child, female breasts and their milk, and, more broadly, life, learning, the tribe as a whole, and tribal custom in general. Throughout the day's dancing, the initiand lies motionless and naked in a clear *regressus ad uterum*, tightly wrapped within a blanket. Meanwhile, another important symbolic item is introduced to the ceremonial apparatus: After the bridegroom's (phallic) arrow has been inserted into the roots of the *mudyi* tree, a string of white beads, representing the emergent fertility of the initiand, the children she will bear to her husband, and the continuity of her matrilineage, is draped over the arrow. Shortly before this, the women sing:

They are giving you Nkang'a.
You have grown up, my child,
When you have passed puberty you will be pregnant.

Late in the day, a seclusion hut is prepared for the initiand on the side of the village opposite the *mudyi* tree; at sunset she is taken there, carried through the village on the back of the instructress. Here she will spend some weeks or even months, in the second stage of the rite, Kunkunka ("seclusion in the hut"). During this time, she is subjected to numerous ritual interdictions and is given detailed instruction, primarily in dance and in sexual technique. Men may not enter the seclusion hut, with one significant exception: When the girl is first placed within, her future bride-

groom enters to light a new fire for her, representative of their impending marriage. The white beads with which the initiand was earlier presented are now wrapped around a miniature bow (the female counterpart to the male arrow) and placed at the apex of the seclusion hut, where an arch is formed of two poles from the *mudyi* tree, symbolic of the female thighs spread in the position of intercourse. The apex thus represents the genitals, and the beads, once again, the children the initiand will bear. Throughout her period of seclusion, however, the initiand is forbidden to look up and see this mystery that rests over her.

The final phase of the ritual, Kwidisha ("bringing out"), begins with a number of mock confrontations between the kinship group of the initiand and that of her bridegroom, in which the latter group is expected to prevail. At dawn, after a night of dancing, the initiand, once again wrapped in a blanket, is carried from her seclusion hut to a place outside the village. There she is washed, shaved, rubbed with oil and red earth, adorned with rattles, and dressed in a skirt, although her now more fully developed breasts remain exposed. Most importantly, her hair is carefully coiffed, leaving a central part into which the string of white beads is placed. The entire coiffure is then covered with densely packed oil and earth. Many of the women present also remove their beads and place them on the head and shoulders of the novice, so that she bears upon her the fertility of all womankind while hiding her own personal fertility as a secret within.

Once adorned, the initiand is led to the village dance place, where she dramatically exhibits the dance skills she has acquired while in seclusion, receiving compliments and gifts from all assembled. In these dances, she is at the height of her power, as is evident from the fact that at a certain moment she is given the eland-tail switch, emblem of the village headman's authority, to carry. Shortly thereafter, however, she must kneel before the drums of the men of the village, dance kneeling, and then spit before the drums "in blessing and thanksgiving." When the dance is concluded, the initiand is led to her bridegroom's hut, where the marriage is consummated. If all goes well, on the following morning the newly married woman, her initiation complete, washes and takes the white beads from her hair in the presence of her husband, shaking the red earth—perhaps signifying the blood of parturition or menstrual blood—from her hair. The beads are then carried to her mother, who will keep them until the rituals for her daughter's first pregnancy are performed, at which time the beads are returned to her.

In assessing this complex and fascinating ritual, Victor Turner (1968) has called attention above all to the way in which it serves to adjust the Ndembu social field when it has been temporarily disrupted by the emergence of a female member from childhood to adult status. This transition calls into focus the deep-seated contradiction in Ndembu social organization between matrilineal descent and virilocal residence: When a girl reaches maturity and marries, she is lost to her lineage, the very lineage that she is expected to perpet-

uate through the birth of her children. Thus, in the ritual she is first systematically separated from her mother and then gradually handed over to her husband through the intermediary of the instructress; at the same time, the mother is reassured that her daughter's children—represented by the string of white beads—will be returned to her and will ensure the continuity of her matrilineage, as well as the continuity of the Ndembu people as a whole.

Beyond this, one must also consider the effects of the Nkang'a ritual on the initiand herself, for her fertility—what makes her a woman and no longer a girl—is symbolically and ceremonially created within the course of the ritual through her association with the *mudyi* tree, with the apex of the seclusion hut, and, above all, with her string of white beads. But for all that a woman's creative power in fertility is celebrated, her position of sociopolitical subordination is also unambiguously asserted: After a brief flirtation with power as she carries the eland-tail badge of authority, she is quickly forced to kneel before the men's drums.

The ways in which traditional social definitions of ideal female nature are effectively impressed upon successive generations of women through initiation rituals are given striking expression in the Kinaaldá ("first menstruation," or perhaps "house sitting") ceremony of the Navajo, as reported by Charlotte Johnson Frisbie (1967) and others. A major part of this four-night, five-day ceremony is the repeated massaging of the initiand by older women of known good character. Known as "molding," this practice has as its explicit goal the definitive reshaping of an individual woman, both in terms of bodily form and moral character: for it is stated that at the time of her initiation, a girl's body becomes soft again, as it was at birth, so that she is susceptible to the pressures exerted on her by the hands, minds, and speech of those around her.

The events of the Kinaaldá are all patterned upon the first Kinaaldá, performed for the goddess Changing Woman (also known as White Shell Woman), recounted at length in the blessingway, one of the longest and most important of Navajo sacred chants. The initiand is dressed as Changing Woman, and she is systematically identified with her through sacred songs, just as the girl's family dwelling, where the ritual is celebrated, is identified with that occupied by the goddess at the dawn of time.

Changing Woman, in the opinion of many the most important of Navajo deities, is an enormously complex figure who defies easy categorization. In part the paramount representative of the abstract principle *hózhó* (lit., "beauty," but also "harmony," "balance," "goodwill," etc.), the Navajo *summum bonum*, she is also identified with the earth, vegetation, fertility, growth, abundance, and ideal womanhood. Moreover, as recounted in the blessingway, having become pregnant by the Sun, she gave birth to the twin culture heroes of Navajo mythology, who rid the world of monsters and established civilization as humans know it.

For the first four days of the Kinaaldá, the initiand's actions are quite restricted. Most of her time must be spent in the family hogan grinding corn, and through her vigorous labor at this time it is expected she will come to be industrious—industry being a highly prized female virtue for the Navajo—for the rest of her life. Repeatedly she is “molded,” and three times each day she must run eastward from the hogan in pursuit of the Sun. Ultimately, this pursuit seems to be successful, and it is implied that the initiand will conceive by the Sun, as did Changing Woman. But this will not happen until the initiand is thoroughly assimilated to the goddess in the course of an all-night sing held for her on the fourth night of the ritual. In the songs chanted at that time, the family hogan is identified with that of Changing Woman, located at Gobernador Knob, the sacred mountain where she was born out of the union of Sky and Earth. Further, all those who attend the sing take on the identity of the gods who participated in the initiation of Changing Woman; most important, the initiand is herself thoroughly identified with the goddess, as in the following song:

I am here; I am White Shell Woman, I am here.
 Now on the top of Gobernador Knob, I am here.
 In the center of my white shell hogan I am here.
 Right on the white shell spread I am here.
 Right at the end of the rainbow I am here.

At dawn on the fifth day, as an all-night sing comes to a close, the initiand runs to the east for the last time, toward the rising sun that has just cast its light on her through the hogan's eastern door. Shortly thereafter, the participants in the sing move outside to eat a sweet circular corn cake that has been baking in an earth oven overnight. Compressed within this cake are symbols of the sun and earth, male and female, vegetation, pregnancy, birth, the four cardinal points, and the zenith and nadir. All partake of this cake except the initiand, who offers it to the others as if she herself has given birth to it and to all it represents. The Kinaaldá is expected to ensure universal rebirth consequent upon a woman's initiation, for as Changing Woman was told at the first such ritual, as a result of its proper performance, “there will be birth. Vegetation, as well as all without exception who travel the surface of the earth, will give birth; that you will have gained.”

Emergent sexuality is celebrated as the means for the renewal of life, society, and the cosmos in both the Kinaaldá and the Nkang'a rituals, although ceremonies of female initiation celebrated within cultures that hold a more ambivalent attitude toward sex can be expected to treat things quite differently. Thus, for example, as Audrey I. Richards reported in her 1956 study of the Bemba of Northern Rhodesia, among the Bemba sexual intercourse is considered a “hot” activity that can pollute domestic and ritual fires by which approach ought be made to the ancestral spirits central to all cultic activity. Only if a man and wife purify themselves after sex, using a small secret pot conferred upon the wife at the time of her initiation (Chisungu), may these dangers be

avoided. The Chisungu—which is somewhat unusual in that it is a corporate ritual in which a group of girls are secluded together for a month or more—thus involves considerable instruction in the mysteries of sexuality, pollution, and purification. By the application of those principles that are learned during initiation, and through the pot that is conferred only upon those who have been initiated, women are able to bring the dangers of sexuality under control. But the tensions, anxiety, and aggression implicit in male-female relations are emphatically dramatized in the culminating acts performed on the final night of the ceremony, when mock bridegrooms appear at the Chisungu hut, singing loudly, “I have tracked my game, / Now I have speared my meat,” after which they symbolically carry off their “brides.”

Such ambivalence toward emergent female sexuality is not particularly common among agricultural populations, who regularly associate a woman's fertility with the desired fertility of the land. But among peoples whose means of subsistence is hunting and/or fishing, the situation is different, for there it is often perceived that an excess of human fertility results in overpopulation that threatens a fragile ecosystem. Such considerations clearly affect the cultural norms of ideal womanhood as they are transmitted—or better, continually recreated—in initiatory rituals. Thus, for instance, the initiand in the Tucuna Festa das Moças Novas (Festival of the New Maiden) is menaced by a variety of demons (the *noo*) who, according to the myths of this fishing people of the northwest Amazon, avenge themselves mercilessly on those who disrupt the delicate balance of humans and game. Isolated within the large familial residence (*maloca*) in a chamber that bears the name of the underworld of the *noo*, the initiand is told these spirits will kill her, suck the viscera from her body, and carry off her empty corpse, should she violate any of her ritual prescriptions; each night she hears the “voices” of the *noo* in the form of sacred trumpets hidden from women's view by men. Upon emerging from her seclusion chamber—like a butterfly from a cocoon, according to Tucuna metaphor—the initiand is again assaulted by the *noo*, now represented by a host of masked dancers, who only in the course of a wild night of drink and dancing shed their costumes and resume human identity. Should the girl survive this ordeal, she is taken on a symbolic tour of heaven, earth, and multiple underworlds, and is finally bathed in a contraceptive solution passed upward from her feet to her head, “to prevent her becoming prematurely pregnant.” Only when these magico-ritual checks upon her potentially excessive fertility have been established is the Tucuna woman accorded adult, marriageable status.

In general, specialized initiatory rites for women tend to disappear in urban and later in industrial societies; often they blend into marriage ceremonies or into those lacking gender specificity, such as graduation from school. Still, it is sometimes possible to recognize the traces of older women's initiation rituals within a new context and dramatic program. Thus, for example, such scholars as Angelo Brelich

and Walter Burkert have been able to show how, within the Greek *polis*, broader rituals of women's initiation came to be narrowed so that only a few individuals, drawn always from wealthy, prominent families, passed through a series of initiatory schemata, serving perhaps as representatives of all women in general. In his *Lysistrata* (lines 641ff.), Aristophanes preserves a list of the age-grades through which these women passed: *arrēphoros*, *aletris*, *arktos*, and *kanēphoros*, each status conferred by ritual means. While the details of each grade are complex, it may be noted briefly that the last two of these were celebrations and consecrations of a young girl's virginity prior to marriage: As an *arktos* (lit., "bear") she took up residence with Artemis in the wilds; as a *kanēphoros* she carried a basket holding sacred objects for the Panathenaia festival celebrated in honor of Athena. (Artemis and Athena were the goddesses most protective of virgins and virginity.) Having played the role of *kanēphoros*, however, a girl was considered eligible for marriage; in myths such as that of Oreithyia women are abducted and raped while or shortly after appearing as *kanēphoros*.

Although they may appear in combination in any specific ritual complex, four general "ideal types" of women's initiation have been recognized. These are (1) rituals of bodily mutilation, involving such operations upon the initiand's physical self as tattooing, scarification, clitoridectomy, or other genital surgery as well as such processes as the Navajo "molding"; (2) rituals involving identification with a mythic heroine, whether goddess, culture heroine, primordial ancestress, or some other prototypical figure; (3) rituals involving a cosmic journey, in which the initiand is symbolically conveyed to heavens, underworlds, the four quarters, and other places of cosmologic significance, as a means of lifting her beyond her normal locus and identity; (4) rituals focused upon the play of opposites, wherein such normally exclusive categories as male/female, human/divine, above/below, right/left, black/white, and wild/tame are somehow united within the initiand, establishing her as a being who transcends the dualities of fragmented mundane existence.

In all of these types, three interrelated levels of transformative action are regularly claimed to be accomplished. First, it is claimed that rituals of women's initiation transform a girl into a woman, conferring upon her marriageable status. Second, it is claimed that they renew society, providing it with new members ritually empowered to play productive and reproductive roles for the good of the social totality, whether lineage, tribe, or other corporate entity. Third, it is claimed that they renew the cosmos, by virtue of the homology between the initiand's fertility and that of nature at large. This last claim is the most audacious and fascinating of all.

It must be emphasized, however, that in contrast to male initiations, women's rites do not usually advance those who have completed them toward political offices of power and prestige. For while the status of a woman may be ritually changed from that of child to adult (from unmarried to marriageable or even married), the woman's sphere of influ-

ence and activity has been restricted in virtually all human societies to the home. In light of this, it appears a reasonable hypothesis that the exorbitant claims of cosmic transformations wrought by women's initiation and of the cosmic significance of an adult female life offer a form of false consciousness that deflects women's attention and lives from the sociopolitical arena, offering a religio-cosmic ground of meaning and action in place of the sociopolitical one reserved—and preserved—for men.

The chief attempts to draw theoretical generalizations regarding rituals of women's initiation are D. Visca's "Le iniziazioni femminili: Un problema da riconsiderare," *Religioni e Civiltà* 2 (1976): 241–274; my *Emerging from the Chrysalis: Studies in Rituals of Women's Initiation* (Cambridge, Mass., 1981); and Judith K. Brown's "A Cross-Cultural Study of Female Initiation Rites," *American Anthropologist* 65 (1963): 837–853. The last of these, however, has been subjected to severe criticism by Harold E. Driver in his "Girls' Puberty Rites and Matrilocal Residence," *American Anthropologist* 71 (1969): 905–908.

Among the finest anthropological case studies of specific data are Victor Turner's *The Drums of Affliction: A Study of Religious Processes among the Ndembu of Zambia* (London, 1968), pp. 198–268; Charlotte J. Frisbie's *Kinaaldá: A Study of the Navaho Girl's Puberty Ceremony* (Middletown, Conn., 1967); Audrey I. Richards's *Chisungu: A Girls' Initiation Ceremony among the Bemba of Northern Rhodesia* (London, 1956); Kathleen E. Gough's "Female Initiation Rites on the Malabar Coast," *Journal of the Royal Anthropological Institute* 85 (1955): 45–80; and Judith Modell's "Female Sexuality, Mockery, and A Challenge to Fate: A Reinterpretation of South Nayar talikettukalyanam," *Semiotica* 50 (1984): 249–268. Classicists have also made considerable progress in the reconstruction of women's initiations as practiced in the ancient world. Among the best of these studies are Angelo Brelich's *Paides e Parthenoi* (Rome, 1969) and Walter Burkert's "Kekropidensage und Arrephoria: Vom Initiationsritus zum Panathenäenfest," *Hermes* 94 (1966): 1–25.

BRUCE LINCOLN (1987)
Revised Bibliography

INNER ASIAN RELIGIONS. Inner Asia, essentially a historical concept, was that great land mass surrounded by the civilized worlds of Rome, Greece, Arabia, Persia, India, and China. Central Eurasia, the more scholarly term for the region, should not be confused with Central Asia, which, in the strict sense, comprises the modern-day Uzbek, Turkmen, Kirghiz, Kazakh, and Tajik republics; or, in a broader sense, adds Chinese Turkistan (Sinkiang). Until modern times, the boundaries that separated Inner Asia from the rest of the Eurasian land mass were in constant flux, expanding or contracting according to the relations of the peoples within Inner Asia toward the surrounding sedentary states.

Inner Asia is a vast area with a multitude of peoples, speaking a variety of languages, possessing distinct religious practices, yet culturally united in a unique civilization. The languages spoken in Inner Asia belong to a number of linguistic families, the largest of which is Altaic (comprising the Turkic, Mongol, and Tunguz languages), followed by Uralic (the Finno-Ugric and Samoyed languages), Paleosiberian or Paleo-Asiatic, Indo-Iranian, and the isolated languages of the Caucasus. The noninstitutionalized forms of religion in Inner Asia, as reported by early travelers and recorded by historians, were most evident in their myths of origin, in the ceremonial activities present in daily life, such as rituals performed before hunting or connected with funerals, and in art. Tolerance of outside religions was the norm, rather than the exception, and Buddhism, Islam, and Christianity all exerted great influence on the region.

Ecologically, Inner Asia is divided into four great longitudinal belts: the tundra in the far north, the forest (taiga), the steppe, and finally the desert in the south. The existence of these four separate zones has led to the inaccurate stereotyping of the economic activity practiced in the north by the Finno-Ugric, Samoyed, and Tunguz peoples as hunting, fishing, and gathering, and that practiced in the south by the Turkic and Mongol peoples as exclusively nomadic herding. However, just as hunting and limited agriculture were a part of Turkic and Mongol economies, so was animal husbandry a part of the economy of the more northern peoples. The prevailing climatic conditions severely limited agricultural potential without manmade changes in the environment, giving rise to one of the most important unifying features of Inner Asia: the relationship between horse and pasture. As the mainstay of Inner Asian economy, the horse, dependent only on pasture, was either traded for basic necessities, particularly armaments that could only be manufactured by the surrounding sedentary civilizations, or used for military conquest. It thus became the key to the rise of the great nomadic civilizations.

Major problems arise in dealing with the history of Inner Asia. Indigenous written material is extremely scant, existing only from the eighth century CE. Much of the Inner Asian tradition was preserved only orally, transmitted by storytellers, singers, shamans, and priests. Most often the early history of Inner Asia was recorded by the surrounding civilizations, eager to protect their own ways of life and highly critical of different customs and manners. Because the written records are in a variety of nonindigenous languages, the correct identification of names in Inner Asia presents problems. Ethnonyms and toponyms, not to mention personal names and titles, that appear, for example, in Chinese sources are extremely difficult to equate with names or terms given in Greek or Arabic sources. When a name such as *Scythian* or *Hun* or *Turk* first appeared, it meant a specific people; later, the name would often become a generic term applied to any barbarian people. Imprecise geographical knowledge only added to the problems; distances were exaggerated, and few people from the surrounding sedentary civilizations had actually visited Inner Asia. The history of the region therefore must be filtered from ideas and ways hostile to its peculiar civilization and drawn from the precious scraps of indigenous material—written fragments, archaeological data, art—often literally scraped out of the desert sands or the frozen soil of the tundra.

To most peoples from other parts of the world, Inner Asia was seen as one vast zone. The world, from the time of Homer (c. tenth century BCE) until the beginning of the Russian expansion into Asia in the late sixteenth century, saw Inner Asia as a land shrouded in mystery and myth, defined only by its barbarousness. It was the inhospitable land of the north, unfit for man or beast.

ANCIENT VIEWS OF INNER ASIA. Early Chinese and Classical Greek sources spoke of Inner Asia, but many of the peoples mentioned were imaginary and showed the civilized world's lack of real knowledge about the region. To the Greeks these were the peoples who inhabited such places as the City of Perpetual Mist or the Rhipaeon Mountains. These regions and the peoples who lived there were removed, beyond the pale of Greek civilization, their barbarous nature, according to Hippocrates (460?–377? or 359? BCE), directly determined by the environment in which they lived. The Greek geographer and historian Strabo (c. 63 BCE–24 CE) reminded his readers that before the Black Sea was navigable the barbarous tribes surrounding it as well as the fierce storms on it caused it to be called Axine (“inhospitable”); not until the Ionians established cities on its shores did it become known as Euxine (“hospitable”). This case is an example of one of the myths perpetuated about Inner Asia by external historians: the lack of cities was equated with a lack of civilization. On the other side of Inner Asia, the Chinese held similar views. The Inner Asian lived in the “submissive wastes,” the “great wilderness,” the region of the “floating sands,” in the barren lands “where frost came early.” The “five grains” would not grow there. Chinese emperors were often challenged by their ministers on the wisdom of trying to expand

Chinese territory into these wastelands. This attitude perpetuated another myth: the lack of agriculture meant the people were uncivilized.

EARLY MEDIEVAL JUDAIC, CHRISTIAN, AND ISLAMIC VIEWS.

In the Judeo-Christian and Islamic traditions, the peoples of Inner Asia had been driven into the barren, desolate lands of the north, to the hidden, dark regions of the world—to the land of Gog and Magog. When Jeremiah was asked by the Lord what he saw, he answered, “I see a seething pot; and the face thereof is toward the north” (*Jer.* 1:13). Within this “seething pot” were the unknown kingdoms of the north, which, at the end of time, would rise and the contents spill upon the land, bringing death and destruction. Classical Arab and Persian geographers (ninth to eleventh century) located Gog and Magog in the fifth and sixth climes and warned of their cold, bestial nature, but others recognized their brave, warriorlike qualities. To al-Kāshgharī (fl. eleventh century) they were an army, the army of the prophet Muḥammad, to be sent out when he was angry with a people. This army, called Turk, would come at the end of time. The fear that medieval man had regarding the peoples of the north was also manifest in the *Roman d’Alexandre*, in which the hordes of Gog and Magog are sealed off behind an iron gate.

The armies of Inner Asia did not exist in myth alone; the fears of medieval man had been justified by repeated invasions from the steppe lands. Walls—such as the Roman *limes* or the Great Wall of China—were monuments of the civilized world’s futile attempt to contain the encroaching and often unknown peoples from Inner Asia. When the hordes of Inner Asia broke through, they did bring death and destruction with a terrible swiftness. It was because of such invasions that the peoples of Inner Asia first entered recorded history in some detail and accuracy.

THE HISTORY OF INNER ASIA. The peoples of Inner Asia who lived in the tundra and taiga were widely dispersed in small communities and posed no threat to their neighbors. It was the peoples of the steppes, formed in large tribes with vast herds of sheep, goats, camels, cattle, and horses, who were highly mobile and had the organizational ability to lead military excursions against their sedentary neighbors. When these peoples first appear in historical sources, they come from two great steppe regions: the south Russian (or Pontic) steppe and the Mongolian steppe.

Scythians. The first important Inner Asian people, the Indo-Iranian Scythians, appeared on the south Russian steppe in the eighth century BCE and began to fade out of the historical scene around 175 BCE, although some remnants survived until the third century CE. While little is known about their origin, a detailed description of their mode of life and some remarks on their history are given by Herodotos (c. 480–420 BCE) in book 4 of his *Histories*. The Scythians were the first historically known people to use iron, and having defeated the Cimmerians, they assumed full command of the south Russian steppe. Their greatness as steppe

warriors was recognized when Darius I (r. 521–486 BCE), king of Persia, led a campaign against the Scythians north of the Black Sea from 516 to 513. These Scythian mounted archers soon frustrated Darius by seemingly fleeing before him, attacking when and where he least expected, all the while drawing him farther and farther into their land. In the end, Darius was forced to retreat to Persia. This type of warfare and the ability of the skilled horseman to turn and shoot behind him—the Parthian shot—became a trademark of the Inner Asian warrior.

In Persian sources these people were called Saka, and three kinds were enumerated: the Saka beyond the sea, the pointed-hat Saka, and the Saka who revered Hauma. The Scythians of Herodotos lived north of the Black Sea, while the Saka of Persian sources lived beyond the Oxus River (the modern Amu Dar’ya) and south of this area in Iran. The social structure of the Scythians was tripartite: agriculturists, warriors, and priests. They had cities, centers of metallurgy, and a highly developed, stylized animal art.

Animals, particularly horses and cattle, as well as humans were sacrificed as offerings to the gods. Herodotos listed the Scythian gods with what he thought were their Greek equivalents, the supreme deity being Tabiti (Vesta). Images, altars, and temples were used. Scythian soothsayers were called into service when the king was ill; Enarees, womenlike men among the Scythians, practiced divination; elaborate funeral and burial rites, a strong will to protect the tombs of their ancestors, and prescribed ceremonies for oath taking existed. By the late second century BCE, the ethnically and linguistically related nomadic tribes of the Sarmatians began to replace the Scythians, who had reached a degree of civilization perhaps unparalleled by any other Inner Asian empire.

Xiong-nu. On the eastern edge of Inner Asia, the Xiong-nu were the first clearly identifiable and important steppe people to appear on the borders of China, constantly menacing the frontier with raids that sometimes penetrated deep into Chinese territory. Their center of power was the Mongolian steppe. Appearing in Chinese sources around 230 BCE, an account of the Xiong-nu was provided by the grand historian of China, Ssu-ma Qian (c. 145–86 BCE). By about 56 BCE internal revolts had begun to rack the Xiong-nu empire and some tribes moved to the west; in 48 CE the Xiong-nu finally split into two major groups: the Southern Xiong-nu and the Northern Xiong-nu. The former continued to be a serious threat to China and finally faded from the historical scene around 400 CE, while the Northern Xiong-nu remained on the original homeland of the Mongolian steppe. The Northern Xiong-nu never regained their former power, however, and about 155 CE they were destroyed by another steppe people, the Xianbei.

The language of the Xiong-nu is unknown. Long thought to be Mongol or Turkic, more recent studies seem to indicate that it comprised some elements of the Yenisei branch of the Paleosiberian languages. Since the eighteenth century, it has been popular to equate the Xiong-nu of the

east with the Huns of the west: at best the theory is controversial.

The military power of the Xiong-nu, like that of the Scythians, lay in their remarkable skill as highly disciplined mounted archers. In fact, Ssu-ma Qian considered warfare their main occupation. Made up of numerous tribes, the Xiong-nu confederation was most highly organized in its relations with foreign states, depending upon the horse for both military superiority and for economic gain. The Chinese set up border markets in an attempt to weaken the Xiong-nu by supplying them with luxuries and fostering a dependence on Chinese goods. Even though there was a hereditary aristocracy within the Xiong-nu confederation, internal organization was loose, each tribe having its own pastures. A son would marry his stepmother when his father died; a brother would marry a deceased brother's widow—both practices aimed at preventing the extinction of the clan.

At set times of the year, sacrifices were offered to ancestors, gods, heaven and earth, while auspicious days were chosen for major events, and the stars and moon were consulted for military maneuvers. Burials were elaborate, particularly for the ruler, with many of his concubines and loyal ministers following him in death. Although condemned by the Chinese for lacking in morals, not understanding court ritual, and not showing respect for the aged, the Xiong-nu had laws, customs, and manners of their own that contradicted the ethnocentric views of the Chinese.

Yuezhi, Wusun, and Kushans. The Xiong-nu greatly affected the history of Inner Asia to the west and south of their domains where, in 160 BCE, they inflicted a terrible defeat on the Yuezhi, an Indo-European people located on the Chinese border of modern Gansu province. This caused the Yuezhi to divide; the Lesser Yuezhi moved to the south while the Greater Yuezhi began moving west. As the latter migrated through the Ili River valley, they abandoned the Mongolian steppe to the complete control of the Xiong-nu, while they themselves displaced the Sai (or Saka) tribes. The majority of the Yuezhi continued to move west into the Greek state of Bactria. At about the same time, the Chinese emperor Wudi (r. 140–87 BCE) sent Chang Qian to the Greater Yuezhi to form an alliance against the Xiong-nu. Leaving in 139, Chang Qian had to pass through Xiong-nu territory, where he was detained and held prisoner for more than ten years. Chang Qian's account, made to the Chinese emperor on his return, brought the first real knowledge of the western regions to China, information that would allow China to expand westward and become actively involved in Central Asia. Although his mission to the Yuezhi failed, he was sent again in 115 to try to form a different alliance against the Xiong-nu, this time with the Wusun, another people probably of Iranian origin, who accepted the gifts that Chang Qian brought as well as an imperial princess to become the wife of their ruler, but who also refused to cooperate. It was not until the Xiong-nu empire was disintegrating that the Wusun inflicted serious defeats on them.

The Yuezhi tribes that settled in Bactria were later united under one tribe, the Kushans, probably in the first century BCE. Besides Bactria, their kingdom included extensive domains in Central Asia and large portions of Northwest India, where centers of Greco-Buddhist art were established at Gandhāra and Mathurā. The Kushan period is extremely controversial, and the dates and order of kings are widely disputed. But it was during the reign of Kaniška, a patron of Buddhism, that this Indian religion began to spread into Central Asia and China, heralding a new era for the region. Chinese monks began to travel to India and Sri Lanka to obtain the Buddhist sūtras, passing through Dunhuang, Khotan, and Turfan on the edge of the Tarim Basin, as well as Ferghana and Sogdiana. Most notable are the accounts left by the monks Faxian (traveling from 399 to 413 CE) and Xuanzang (traveling from 629 to 645). Buddhist texts had to be translated into Turkic languages; the routes used by pilgrims were destined to become active trade routes, linking east and west.

Huns. With the appearance of the Huns toward the end of the fourth century CE, a new movement began on the south Russian steppe. Rumors of invasions spreading fear and panic reached Jerome (c. 347–420) in Palestine, where he wrote that these “wolves of the north”—the Huns—spared neither religion nor rank nor age.” It was with this turmoil on the steppe north of the Sea of Azov that the *Völkerwanderung*, or migration of the peoples, began. The name *Hun* first appears in the writings of Ptolemy (fl. second century CE), but later historians of the Huns such as Ammianus Marcellinus (c. 322–400), Priscus (fl. fifth century), and the less reliable Jordanes (fl. sixth century) portray a culture typical of Inner Asian society and very different from Roman civilization. Aided by civil wars in Italy that occupied the Roman army, some Hun tribes had established themselves by 409 on the Roman *limes* and in the Roman province of Pannonia (on the right bank of the Danube). When, in 434, a Hun king named Rua died, he was succeeded by his nephews, Bleda and Attila.

Hun penetration into Europe and the displacing of existing tribes were instrumental in the formation of modern Europe. Aetius, the great fifth-century general and power broker of the Western Roman Empire, provoked some Hun tribes to attack the Burgundians in 437 in order to shatter Germanic power and to strengthen Roman rule in Gaul. The Visigoths, who had been pushed from the east into the Toulouse area, forced the Vandals into Spain and North Africa, an event that caused great consternation to the entire Roman Empire. However, Aetius's attempt to use the Huns to defeat the Visigoths failed in 439. Turmoil continued, this time in the Eastern Roman Empire with the Persian decision to attack Byzantium; at the same time, Attila attacked the Byzantines from the north, gaining new treaty concessions. Then in 445 Attila murdered Bleda, thus becoming the sole ruler of the Hun tribes of Pannonia. In the end, a nervous Aetius allied himself with the Visigoths to meet Attila in the Battle

of the Catalaunian Plain (451) near Troyes, France, where the Visigoth king Theodoric II lost his life and the Romans withdrew in a battle that left neither Hun nor Roman the victor. With Attila's death in 453, Hun influence on Europe rapidly crumbled.

Where the Huns had originated is unknown, but written sources leave no doubt on their physical appearance, which was clearly mongoloid. No text in the Hun language has been found; archaeological finds from Hun areas remain controversial. What is certain is that despite their impact on the formation of Europe, the Huns never attained the power of the great Inner Asian states such as those of the Türks or the Mongols.

Xianbei and Ruanruan. As already mentioned, the Northern Xiong-nu state was replaced around 155 CE by that of the Xianbei, who probably spoke a Mongol language. Through this victory, the Xianbei became the dominant tribal confederacy on the Mongolian steppe. With other nomadic peoples, including the Southern Xiong-nu and the Wuhuan, they continued attacks on China but were repulsed, particularly by the famous Chinese general Cao Cao. When the Xianbei first appeared, during the Wang Mang interregnum (9–23 CE), they had no supreme ruler; unified leadership is not ascribed to them until just before their defeat of the Xiong-nu. Oral tradition embellished this first leader, Tanshihuai (d. between 178 and 183), with a “miraculous birth,” heroic qualities, and the wisdom to be a chief, yet the Xianbei failed to create a lasting empire in this fragmented period of steppe history.

From approximately 400 to 550 a new power emerged on the Mongolian steppe: the Ruanruan (or Jou-jan). Their origins are uncertain but future research may clarify their relation to the Hua and to the Avars who appeared in Europe in the fifth century. According to a widely accepted but yet unproven theory, the Ruanruan in the east are identified with the Avars in the west. Personal names, as given in Chinese, do not appear to be either Turkic or Mongol, but it is with the Ruanruan that the title *kaghan* is first used for the ruler. In 546 the last ruler, A-na-kui, was approached by a man named Bumin (Tumen), whom he called a blacksmith slave, and who had the audacity to request the hand of one of A-na-kui's daughters. He was rudely refused—so the story goes—whereupon Bumin and his followers revolted, overthrew the Ruanruan, and established their own Türk empire.

Türk. The appearance of the Türk—the first Inner Asian people whose language is known and the first also to use with certainty a Turkic idiom—marks a turning point in the history of the steppe. According to Chinese sources they were metallurgists employed by the Ruanruan, but it is not clear whether the revolt led by Bumin (d. 552) was social in character or a minority uprising. After Bumin's death the empire split, one group, led by his son, establishing itself on the Mongolian steppe, while the other group, under the leadership of his brother Ishtemi, ruled over the more western part of the empire. They encountered the Ephthalites (or

White Huns) on the borders of Persia. The Türk made an alliance with Sasanid Persia (226–655), encircled and destroyed the Ephthalites, establishing thereby a common border with Persia, but also obtaining control of the lucrative silk trade. Because of its commercial interests—represented mainly by Sogdian merchants—the Western Türk empire then found itself embroiled in the conflict between Persia and Byzantium. Persian attempts to stop silk from reaching Byzantium forced the Türk to go directly to Byzantium by a northern route. It was for this reason that embassies were first exchanged between Türk and Byzantium, opening up entire new horizons for Romans as well as for the Chinese. The first Türk embassy, headed by a Sogdian named Maniakh, reached the court of Justin II (r. 565–578) in 567. The Türk embassy remained in Constantinople, then part returned to the Türk with the Byzantine ambassador Zemarkhos. A later Greek ambassador arrived at a Türk camp at the death of the ruler and witnessed the funeral rites, which included laceration of the faces of the mourners and the sacrifice of horses and servants. The Western Türk empire disintegrated around 659.

The Eastern Türk empire, in a semipermanent state of war with China and plagued by internal dissension, was finally defeated in 630. Chinese rule then lasted until 682 when the Türk revolted and again seized power, forming a second Türk empire that was overthrown in 743 by the revolt of three Turkic tribes: the Basmil, the Karluk, and the Uighur. It was from the period of the second Türk empire that the first indigenous texts from Inner Asia—as stated above, written in a Turkic language—have been found. The most famous of these are funeral-stela inscriptions written in a runiclike alphabet found in the area of the Orkhon River and dedicated to the Türk ruler, Bilge Kaghan (r. 716–734), his brother Kül Tegin, and the prime minister Tonyuquq. These texts give not only a history of the Türk people but also provide valuable insight into Türk society and customs, including their belief in *tengri* (“heaven, sky”), in the sacred mountain of Ötükän, and in the erection of *balbal* (stone pillars) on the tomb of a warrior inscribed with the name of an enemy he had killed. Chinese sources recorded three Türk legends of origin quite different from one another: the child raised by a wolf, the child born of the spirit of wind and rain, the child born of the spirit of the lake. Such a multiplicity of ancestral traditions would suggest that the Türk empire was most likely a confederation of tribes of diverse origin.

Avars, Khazars, and Bulgars. The Greek historian Priscus wrote of a migration of peoples taking place from 461 to 465 on the south Russian steppe. An embassy from the Oghur, Onoghur, and Saroghur had arrived in Byzantium, reporting that they had been pushed by the Sabir, who in turn were being displaced by a people in Central Asia called Avar. For almost a century there was no news of them, but in 558 the Avars, now in the Caucasus, sent an embassy to the Byzantine emperor Justinian I (r. 527–565) requesting land in exchange for military protection. Fleeing from the

Western Türk, the Avars were given asylum in the Byzantine Empire by Justin II, an act that infuriated the Türk, who considered the Avars their own, fugitive subjects. It is a well-documented Inner Asian concept that ruling tribes owned the peoples whom they had conquered. Settled in the Carpathian Basin, the Avars remained there for some two and a half centuries, becoming an effective wedge between the northern and southern Slavs. When they had arrived in the Carpathian Basin, the Avars found two Germanic tribes, the Gepids, whom they destroyed, and the Lombards, who fled and settled in northern Italy. The Avars also menaced the Byzantines and the Franks. In 626 the Avars and the Persians jointly attacked Constantinople and were defeated only when the Byzantine forces destroyed the Persian fleet as it attempted to cross the Bosphorus.

Meanwhile, the south Russian steppe continued to be a place of turmoil. The Turkic-speaking Khazars became increasingly powerful with the weakening of the western Türk, and by the mid-seventh century achieved independence. Christian and Islamic missionaries had already had some influence among the Khazars, but in 740 the Khazar ruler and his entourage adopted Judaism. Not an empire bent on conquest, but practicing a settled, mixed economy based on cattle breeding, agriculture, and trade, the Khazars nevertheless caused some movement on the steppe and prevented Arab and Islamic penetration into eastern Europe. Pushed by the Khazars, the Bulgars (a Turkic-speaking people who had lived on the Pontic steppe from the late fifth century) split around 680. One group, moving north to the Volga-Kama region, was, in 921, visited by an Arab embassy described by one of its members, Ibn Faḍlān, who left an invaluable account of both the Khazars and the Volga Bulgars. A Christian Bulgar prince, Kovrat, and his son Asparukh led other Bulgar tribes, mostly Turkic, to the lower Danube region where Asparukh created a Bulgar state between 679 and 681. Some of the Bulgars settled with the Avars in the Carpathian Basin, but the formation of this Bulgar buffer state between the Avars and Byzantium effectively ended Avar-Byzantine relations by 678. As a result, the Avars led a reasonably quiet life for over a century until they were attacked and greatly weakened (although not defeated) in 791, 795–796, and 803 by Charlemagne. The Avars slowly disappeared over the next eighty years until Hungarian (Magyar) tribes filled the vacuum and maintained the non-Slavic wedge in central Europe.

Uighurs. The final blow to the Türk empire was delivered by the Uighurs who, as we have seen, had been a part of the Türk confederacy. Their language was basically the same as that of the Türk, with some of their texts written in runic script and some in a script borrowed from the Sogdians, one that would become a major script used in Inner Asia. Unlike the Türk, whom they overthrew in 743, the Uighurs often allied themselves with China; thus, during the reign of Mouyu the Uighurs helped China to quell the An Lushan rebellion (755–757). When Mouyu visited Luoyang in 762–763, he was converted to Manichaeism, which had

been propagated in China by the Sogdians. A description of his conversion appears on the trilingual inscription (in Uighur, Sogdian, and Chinese) of Karabalghasun, the Uighur capital city. When Mouyu returned home he took Manichaean priests with him and made Manichaeism the state religion. Thus, the Uighurs became the first Inner Asian people to adopt an institutionalized, major religion. Many Uighurs disliked the influence gained by Sogdians in Uighur affairs and an anti-Sogdian faction, led by the uncle of Mouyu, revolted and killed the *kaghan* and his family. There followed a succession of rulers embroiled in family intrigues, plagued by assassinations and suicide. Even so, Sogdian and Manichaean influence remained in a kingdom dominated by Buddhism. An Arab traveler, Tamīm ibn Baḥr, visited Karabalghasun in 821 and left an account of what he saw. Of particular interest are his remarks about the flourishing town of Karabalghasun and other small settlements, located in richly cultivated areas. The picture he draws contradicts the stereotyped image of the incompatibility of Inner Asian civilization and urban development. In 840 the Uighurs were attacked by a new Turkic power, the Kirghiz, who lived north and west of the great Mongolian steppe.

Not absorbed into the new ruling Kirghiz confederacy, the Uighurs moved. Some went to China, settling in today's Gansu province, where some of their descendants can still be found; the majority moved to the Tarim Basin and created a new state centered on the city of Kocho (850–1250), where a sophisticated, multilingual, and multiethnic civilization developed. A cultured leisure class in the refined society supported Buddhism, Manichaeism, the arts and letters, and lavish entertainments. Here, the Uighurs adopted a completely sedentarized life based on agriculture supported by extensive irrigation works. As Kocho was a main stop on the east-west trade route, economic prosperity played a major role in the growth of Uighur civilization. When the Kitans, a Mongol people who overthrew the Kirghiz in 924, offered to let the Uighurs return to their former steppe lands, the Uighurs declined to move, preferring their life in Kocho. In 1250, the kingdom of Kocho voluntarily submitted to the Mongols. Uighur script was adopted by the Mongols and many Uighur scribes became skilled administrators for the Mongols. The famous German Turfan expeditions of 1902–1903, 1904–1905, and 1905–1907, led by A. Grünwedel and Albert von Le Coq, unearthed from the dry sands of the Tarim Basin the glories of the kingdom of Kocho: unparalleled art treasures including Manichaean and Buddhist frescoes and manuscripts in many languages, illuminating the splendor of Uighur civilization.

Mongols. The rise of Mongol power and the domination of the Chinggisid states brought unification to Inner Asia in a way that had not existed since prehistoric times.

Central Asia before the Mongol conquest. Arab penetration into Central Asia began in 652 and culminated in the Battle of Talas (751), thus permitting the spread of Islam into Central Asia. Wars with the Uighurs had forced the Kar-

luk west and in 999 they seized Bukhara, an act that brought strong Turkic influence to the region. Farther to the west on the steppe north of the Black and Caspian seas lived the Turkic tribes of the Kipchaks (known also as Cumans or Polovtsy), whose move to these regions is shrouded in mystery. To the south of them, the Oghuz tribes—mentioned in the Orkhon inscriptions—were steadily moving westward, into Anatolia, where they were to form the basis of the Ottoman state.

The rise of Inner Asian powers in Manchuria. A mixture of forests rich in game, agricultural land made fertile by abundant rainfall, and pastures suitable for horse and cattle breeding determined the basic economy of Manchuria. The settled way of life also made pig raising an important feature of all Manchurian civilizations. In the fourth century, the Mongol-speaking Kitan began to gain dominance in the region, entering into relations with China in 468, but by the sixth century, they came under Türk domination. A new Kitan rise to power was signaled by their attack and defeat of the Kirghiz ruling over the Mongolian steppe in 924; they then expanded their rule over North China, adopting the Chinese dynastic title of Liao (927–1125). In 1125 Kitan domination was replaced by that of the Jurchen, a Tunguz-speaking Manchurian people who had been Kitan subjects. The Jurchen assumed the Chinese dynastic title of Chin (1125–1234) and maintained their rule over northern China until the Mongol conquest. When the Jurchen moved into North China, some Kitan tribes, with the permission of the Uighurs, moved west across the Tarim Basin through the kingdom of Kocho to Central Asia, where a third Kitan state was founded (after those of Manchuria and China), that of the Karakitai (Black Kitan or Kitai) centered at Bala-sagun in the Chu River valley.

Chinggis Khan and the Mongol conquest. Between Central Asia and Manchuria, two major mongolized Turkic tribes, the Naiman and the Kereit, were vying for power in the eleventh century. Both tribes had been strongly influenced by Nestorianism; the conversion of the Kereit around 1000 was related by the Syriac chronicler Bar Hebraeus (fl. thirteenth century). The first united Mongol kingdom ended in the late eleventh century, followed by a period of internecine warfare between Mongol tribes and against the neighboring Tatar tribes. It was not until Chinggis (known as Temüjin before he was elected khan) had defeated all of his rivals that a new and powerful Mongol state emerged. These events, chronicled in *The Secret History of the Mongols* (mid-thirteenth century), were only the first shadows of what was to come as the Mongol empire spread over the Eurasian continent.

Chinggis, angered by the Naiman leader Küchlüg, who had defeated the Karakitai in Central Asia, began the great push west, defeating the Naiman in 1218, and then led a punitive campaign against Khorezm aimed at avenging the murder of Mongol envoys. Before Chinggis's death in 1227, Central Asia had been devastated, and the campaigns of the

famous Mongol generals Jebe and Sübetei had spilled into Georgia, across the Caucasus, and into Russian territory, where the Russian forces and their Cuman allies were defeated in the Battle of Kalka in the late spring of 1223. The Mongols advanced as far as the city of Bulgar where they were turned back at the very end of the year 1223. With the death of Chinggis, the Mongol empire was to be divided among his four sons. But the eldest son, Jochi, predeceased Chinggis and his appanage of the westernmost Mongols, the so-called Golden Horde, went to his son, Chinggis's grandson, Batu. Of the remaining sons, Čagadai's domains were in Central Asia, Tolui remained on the homeland, and Ögedei was elected great khan in 1229.

The Mongols in Europe. Defeating Bulgar in the winter of 1237–1238, the Mongols then swept into eastern and central Europe with a great offensive begun in the winter of 1239–1240: Kiev fell on December 6, 1240, German forces were defeated at the Battle of Liegnitz on April 9, 1241, and the Hungarian army fell two days later. Suddenly, in 1242, the Mongols withdrew from Europe and returned to the rich pastures of the south Russian steppe. All of Europe now accepted the Mongol threat as real, however, an attitude that opened a period of rapprochement in Mongol-Western relations, begun by Pope Innocent IV (r. 1234–1254) at the Council of Lyons (June 1245). Three groups of papal emissaries were sent to the Mongols: the Dominican Ascelinus, the Dominican Andrew of Longjumeau, and the Franciscan Giovanni da Pian del Carpine, who brought back the first extensive accounts of the Mongols, as did the later Franciscan missionary William of Rubrouck, who journeyed to the Mongols from 1253 to 1255.

The Golden Horde and the Il-khanids. With Batu's death in 1256, his brother Berke (r. 1257–1267) became ruler of the Golden Horde. He converted to Islam, thus placing the Golden Horde at odds with the Il-khanids of Persia. The Il-khanids came to power under Hülegü, who sacked Baghdad in 1258 and ended the Abbasid caliphate. The Mamluk sultan Baybars (r. 1259–1277), powerful foe of the Crusaders but also of the Mongols, defeated the Il-khanid forces in the Battle of Ain Jalut (1259), thereby stopping the Mongol conquest of the Arab world. During the reign of the Il-khan Arghun (r. 1284–1291), Buddhism was declared the state religion and close contact was maintained with Europe, particularly with the Vatican and the kings of France and England. Under severe economic pressure, Il-khanid Persia declined and religious tension forced Gazan (r. 1295–1304) to proclaim Islam the official religion. With the death of Abu Sa'īd in 1335, Il-khanid Persia fragmented. Meanwhile, the power of the Golden Horde reached its apogee under Özbeğ (r. 1313–1341), but attempts to expand its territory brought it into military conflict with ambitious Muscovite princes and the great military leader Timur (Tamarlane; 1336–1405) in Central Asia. Finally, the Golden Horde split into three successor states: the khanates of Kazan, Astrakhan, and the Crimea.

The Mongols in China. It was Khubilai (r. 1260–1294), the last great Mongol khan, who brought China under Mongol rule (the Yuan dynasty, 1264–1368). With the extended visit of Marco Polo to Khubilai's court (1271–1292) the first reliable information about China came to the West. After the death of Khubilai, Mongol rule in China began to weaken until they were overthrown in 1368 by the Chinese. What remained of Mongol power returned to the steppe where the western Mongols (Oirats, Dzungars, Kalmuks) became a factor in Central Asia, with two successive Oirat states menacing the territory between the western Mongolian steppe and the Caspian Sea from the mid-fifteenth century until their final defeat in 1758 at the hands of the Chinese.

With the decline of the Mongol empire, the patterns of Inner Asian civilization were well established. The development of firearms eliminated the advantages of the Inner Asian warrior: the economic structure of Inner Asia could not technologically advance. The change from land routes to sea routes considerably diminished Inner Asia's role as an intermediary between east and west. Even though the last Chinese dynasty, the Qing (1644–1911) was Manchu, founded by Tunguz-speaking peoples from Manchuria, it rapidly became sinicized, losing much of its Inner Asian character at a very early date. The simultaneous penetration by Russia and China had profoundly changed the structure of Inner Asian civilization. The history of these later periods, not typically Inner Asian, does not shed light on what made the civilization of Central Eurasia unique.

BIBLIOGRAPHY

The classic definition of Inner Asia can be found in Denis Sinor's "Central Eurasia," in *Orientalism and History*, 2d rev. ed., edited by Denis Sinor (Bloomington, Ind., 1970), pp. 93–119, and expanded in textbook form in his *Inner Asia: History, Civilization, Languages; A Syllabus* (Bloomington, Ind., 1969). Sinor's *Introduction à l'étude de l'Eurasie Centrale* (Wiesbaden, 1963) is the basic bibliographic work for the study of Inner Asia and is invaluable for the author's opinion on research in a field dominated by French, German, Russian, and Hungarian scholarship. Other histories of Inner Asia that can be consulted with profit include René Grousset's *The Empire of the Steppes: A History of Central Asia*, translated by Naomi Walford (New Brunswick, N.J., 1970); Wilhelm Barthold's *Turkestan down to the Mongol Invasion*, 3d ed. (London, 1968); and the collection of essays in the *Handbuch der Orientalistik*, vol. 5.5, *Geschichte Mitteleasiens*, under the general editorship of Bertold Spuler (Leiden, 1966).

For the art of Inner Asia, Karl Jettmar's *The Art of the Steppes*, translated by Ann E. Keep (New York, 1967), provides an

excellent introduction plus ample illustrations both in black and white and in color. The best book on the epic in Inner Asia is Nora K. Chadwick and Victor Zhirmunsky's *Oral Epics of Central Asia* (Cambridge, U.K. 1969), but it concerns only the Turkic-speaking peoples.

For a discussion of the early Arab penetration into Inner Asia, which opened the region to Islam, H. A. R. Gibb's *The Arab Conquests in Central Asia* (London, 1923) remains a useful account. In a similar vein, Owen Lattimore's *The Inner Asian Frontiers of China* (New York, 1940) and *Studies in Frontier History: Collected Papers 1928–1958* (Oxford, 1962) are unique in that much of Lattimore's life has been spent in the region.

The most extensive portrayal of the life of the Scythians can be found in Ellis H. Minn's *Scythians and Greeks: A Survey of Ancient History and Archeology on the North Coast of the Euxine from the Danube to the Caucasus* (Cambridge, U.K. 1913). The most detailed account of the Huns is J. Otto Maenchen-Helfen's *The World of the Huns: Studies in Their History and Culture*, edited by Max Knight (Berkeley, 1973). Annemarie von Gabain's work on the Uighur kingdom of Kocho, *Das Leben im uigurischen Königreich von Qoço: 850–1250*, in "Veröffentlichungen der Societas Uralo-Altaica," vol. 6 (Wiesbaden, 1973), is unparalleled.

For the Mongols there is an abundance of material. René Grousset's *Conqueror of the World*, translated by Denis Sinor in collaboration with Marian MacKellar (Edinburgh, 1967), is the best book on the life of Chinggis. For the Mongol Il-khans and the Golden Horde, Bertold Spuler's *The Muslim World: A Historical Survey*, vol. 2, *The Mongol Period* (Leiden, 1960); *Die Goldene Horde: Die Mongolen in Russland, 1223–1502*, 2d ed. (Wiesbaden, 1965); and *Die Mongolen in Iran* (Leipzig, 1939) are by far the most useful in this complex period of Mongol history.

RUTH I. MESERVE (1987)
Revised Bibliography

INNOCENT I (r. 401–417) was a bishop of Rome. Nothing is known about Innocent's early life save the fact

that, according to Jerome, he was the son of his predecessor, Anastasius I (r. 399–401). His episcopacy took place during the period of Rome's decline and witnessed some important events, namely, the displacement of Milan by Ravenna as the seat of imperial administration in the West (c. 404) and the sack of Rome in 410 by Alaric the Goth. Only thirty-five of Innocent's letters survive, in a variety of sources. A few are short administrative documents, but others are more personal and reveal a vigorous personality with decided views. The severe proscriptions against heretics issued at Rome in 407 by the emperor Flavius Honorius and later incorporated into book 16 of the Theodosian Code were probably inspired by Innocent.

In ecclesiastical matters Innocent took a strong stand with regard to the prerogatives of his see, which he viewed as the ultimate court of appeal in all important ecclesiastical cases, claiming Roman supremacy over church councils and church courts. Through his letter to Decentius, bishop of Gubbio, Innocent was the first pope to voice such a claim of dominion in the realm of liturgy as well. The church at Gubbio was considering using some liturgical rites (probably deriving from Gaul) that deviated from Roman practice. Innocent asserted that Decentius should not depart from the Roman norm—an understandable attitude, because Gubbio was a suffragan see—but went on to censure all other churches in the West (Spain, Gaul, Sicily, and Africa) for not following Roman usage. This stand of Innocent's was without precedent. The letter to Decentius remains a precious historical source on the Roman liturgy of this period.

Innocent's letters to Victricius and Exsuperius, bishops of Rouen and Toulouse, deal with numerous points of ecclesiastical discipline. His statement (to Exsuperius) that marital relations are forbidden to married men from the time of their ordination may indicate that his own birth occurred early in the career of his father, Anastasius I. Other groups of letters show Innocent's involvement with events in Africa and the East. His correspondence with the bishops of Africa deals with the Pelagian controversy; five bishops, including Augustine, had appealed to Innocent for a condemnation. He denounced the error but did not contest the decision of the Palestinian bishops, who had pardoned Pelagius. In the East, Innocent intervened as a supporter of John Chrysostom, the persecuted and exiled bishop of Constantinople, and of Jerome in his struggle with John, bishop of Jerusalem. Innocent also brought the churches of eastern Illyria, which had been part of the Eastern Empire since 388, back into Western jurisdiction.

The principles and precedents established by Innocent became the foundation for many of the claims later made by the medieval papacy. Innocent's policies reflect both his own strong personality and the ecclesio-political situation of the time, when the ascendancy of a new Rome at Constantinople, and the decline of the old Rome, helpless before Alaric, invited the consolidation and assertion of power by the incumbents of the see of Peter, the only apostolic see in the West.

BIBLIOGRAPHY

Innocent I's letters can be found in J.-P. Migne's *Patrologia Latina*, vol. 20, *Epistolae et decreta* (Paris, 1845), cols. 457–637. Not all are genuine; see Eligius Dekkers's *Clavis Patrum Latinorum* (Bruges, 1961), vol. 1, no. 1641. Only the letter to Decentius exists in a good critical edition, with commentary: *La lettre du pape Innocent Premier à Décentius de Gubbio, 19 mars 416*, edited and translated by Robert Cabié (Louvain, 1973). On the emergence of new papal claims and Innocent's role in that development, see Myron Wojtowysch's *Papsttum und Konzile von den Anfängen bis zu Leo I, 440–461: Studien zur Entstehung der Überordnung des Papstes über Konzile* (Stuttgart, 1981), especially pages 205–264. Wojtowysch (p. 205, n. 1) stresses that a new study of Innocent I is needed, although Erich Caspar's chapter on Innocent in his *Geschichte des Papsttums*, vol. 1, *Römische Kirche und Imperium Romanum* (Tübingen, 1930), pp. 296–343, still remains important. Gerald Bonner's review of Wojtowysch's *Papsttum und Konzile* in the *Journal of Ecclesiastical History* 34 (July 1983): 451–453 suggests some added reasons for the fourth-century shifts in papal attitudes.

For Jerome's letter identifying Anastasius I as Innocent's father, see Epistle 130, sec. 16, of Isidor Hilberg's edition in *Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. 56 (Vienna, 1918), p. 196.

PAUL MEYVAERT (1987)

INNOCENT III (Lothar of Segni, 1160?–1216) was a pope of the Roman Catholic church (1198–1216). Innocent was the son of Trasimund of Segni, a count of Campagna, and Clarissa Scotti, daughter of a distinguished Roman family. He was educated first in Rome, possibly at the Schola Cantorum; then in Paris, where he studied theology; and finally in Bologna, where he probably studied law for a short time. Clement III elevated him to the cardinal diaconate of Saints Sergius and Bacchus in 1190. Before becoming pope, Innocent was active in the Curia Romana and took part in a number of legal cases as an auditor. As cardinal, he wrote three theological tracts, *De miseria humane conditionis* (Misery of the human condition), *De missarum misteriis* (Mysteries of the Mass), and *De quadripartita specie nuptiarum* (Four typologies of marriage), in addition to sermons. *De missarum misteriis* and *De miseria humane conditionis* enjoyed enormous popularity until the sixteenth century. Innocent was not a profound theological thinker. His thought was derivative and conventional, even a little old-fashioned.

When Innocent became pope in January 1198, the political situation in Italy and the German empire was very unstable. Emperor Henry VI had died in 1197 after subjecting most of the Italian peninsula to imperial authority. He left a young son, the future Frederick II, and two rival claimants for the imperial throne, his brother, Philip of Hohenstaufen, and Otto of Brunswick. Innocent skillfully extracted promises from both candidates that they would respect the integrity of the papal states. He regained control over the city of Rome and gradually reasserted papal hegemony over the Pat-

rimony of Saint Peter. Although he eventually turned to Henry VI's young son Frederick in 1212, Innocent used the rivalry of Philip and Otto to establish the pope's right to judge a disputed imperial election in an important decretal, *Venerabilem*. He also indicated the importance of imperial affairs for the church by entering many letters, papal and secular, in a special register, the *Regestum super negotio imperii*.

Lack of imperial leadership during his pontificate permitted Innocent to strengthen papal prerogatives outside the papal states and inside the church. He received the kingdom of Sicily as a fief and was regent to young Frederick. In the Roman church he reorganized the Curia and managed the complex administrative and judicial affairs with consummate skill. He developed a new vision of papal monarchy, using earlier traditions, but with a powerful change of emphasis. An ingenious biblical exegete who cleverly used the Bible to support his vision of papal monarchy, he exalted the pope and his authority within the church as no earlier pope had done, and also attempted to mediate the affairs of secular rulers. He extolled the pope's status as Vicar of Christ, placing him above man but below God. The pope exercised divine authority granted by Christ only to him and held fullness of power (*plenitudo potestatis*) within the church.

Innocent formulated most of his ideas about ecclesiastical government early in his pontificate. His theories had practical consequences of strengthening the judicial hierarchy of the church, underlining the pope's position of supreme judge, and, at the same time, fundamentally destroying the last vestiges of the decentralized church of the early Middle Ages. He demanded the subordination of the bishops to the pope and insisted that all episcopal translations, resignations, and depositions fall entirely under papal jurisdiction. His anonymous biographer and other chroniclers drew a picture of a pope with enormous capacity and skill in judicial affairs, who frequently participated in the cases before the papal court and enjoyed the exercise of authority.

During Innocent's pontificate, law became a central concern of ecclesiastical government. He authenticated a collection of his decisions and sent them to the law school in Bologna in 1209–1210. This collection, the first officially promulgated code of canon law, signaled Innocent's awareness that the papacy was an institution with many of the same concerns as secular states. He heard appeals from all parts of Christendom, issued rulings on disputed points of law, and established a professional cadre of trained men in Rome to carry out his policies.

CRUSADES. Innocent called for a new, papally led crusade in August 1198 and imposed a special tax on the clergy to support it. Although the Fourth Crusade (1202–1204) lacked strong leadership and sufficient money, Constantinople, capital of the Byzantine Empire, was successfully assaulted in 1204. Innocent hoped that the conquest of Constantinople would result in the reunification of the Latin and Greek churches, but his hopes were in vain.

In 1218 he summoned another crusade, for which he made final arrangements at the Fourth Lateran Council (1215). Although he died before the Fifth Crusade (1217–1221) departed, it bore his imprint. Financed by the church and directed by the papacy, this crusade was a more sophisticated attempt to elaborate the policies Innocent had conceived in 1198. It was the last attempt of the papacy to organize a crusade without strong secular leadership.

Innocent also turned his attention to the proliferation of heretics, especially in the papal states. In 1199 he issued *Vergentis*, which decreed that condemned heretics should be dispossessed of their lands because heresy is treason. In effect, he defined the church as a state that the heretics had betrayed. This new conception of heresy led to his calling a crusade against the heretics of southern France, the Albigensian crusade (1208–1229). An army was gathered together under the leadership of a papal legate, Arnold Amalric, and at a heavy cost in lives the crusade was successful in extirpating heresy in Languedoc.

PASTORAL CARE AND REFORM. Innocent exalted the authority of the pope but also had a profound understanding of his pastoral duties. His ability to balance power and solicitude marks him as the greatest pope of the Middle Ages. In November 1215, some 412 bishops convened in Rome to take part in the Fourth Lateran Council. The council's seventy-one canons reflect Innocent's concerns. Heresy and the crusade were important items on the agenda—canon 8 established the foundations for the Inquisition—but the canons covered a wide range of other topics. Canon 18 forbade the participation of clerics in ordeals, which necessitated changes of judicial procedure in secular courts; canon 21 dictated that all Christians should confess their sins and receive Communion once a year; canon 50 changed the limits of consanguinity and affinity for marriage from seven to four degrees. Innocent also promulgated a number of canons regulating the lives of the clergy and the administration of churches.

The Fourth Lateran Council was the most important general council of the Middle Ages and provided a fitting end to Innocent's pontificate. Its canons are a measure of Innocent's strengths and serve as a guidepost for his policies. Innocent may have, in the words of the thirteenth-century Franciscan Salimbene, involved the church too much in worldly affairs, but he was a militant pastor and a great monarch.

BIBLIOGRAPHY

Ernest F. Jacob's chapter on Innocent in the *Cambridge Medieval History*, vol. 6, edited by J. R. Tanner et al. (1929; reprint, Cambridge, U.K., 1957), pp. 1–43, though dated, is still readable and full of insights. For a longer treatment, Helene Tillmann's *Pope Innocent III* (1954), translated by Walter Sax from the German (New York, 1980), is sympathetic but not uncritical, and sprinkled with keen observations. Christopher R. Cheney's *Pope Innocent III and England*, "Päpste und Papsttum," vol. 9 (Stuttgart, 1976), is a brilliant study, the sum of a lifetime's work, and broader than its title might

indicate. Three German scholars have recently discussed Innocent's thought and policies: Helmut Roscher's *Papst Innocenz III. und die Kreuzzüge* (Göttingen, 1969) examines all aspects of Innocent's crusades; Manfred Laufs's *Politik und Recht bei Innocenz III.* (Cologne, 1980) describes the dispute between Philip of Hohenstaufen and Otto of Brunswick, and Innocent's handling of this complex problem; Wilhelm Imkamp's *Das Kirchenbild Innocenz' III., 1198–1216*, "Päpste und Papsttum," vol. 22 (Stuttgart, 1983), explores the theological basis of Innocent's ecclesiology. Brian Tierney gives a masterful analysis of Innocent's ideas on the relationship of church and state in "Tria quippe distinguit iudicia. . . .": A Note on Innocent III's Decretal *Per venerabilem*," *Speculum* 37 (1962): 48–59. Innocent's vision of papal monarchy is studied in my book *Pope and Bishops: The Papal Monarchy in the Twelfth and Thirteenth Centuries* (Philadelphia, 1984). Editions of Innocent's works cited at the beginning of the article can be found in Cheney and Imkamp.

KENNETH PENNINGTON (1987)

INNOKENTII VENIAMINOV (John Popov Veniaminov, 1797–1879), known in English as Innocent, was a Russian Orthodox missionary to Alaska, bishop of Siberia and Alaska, and metropolitan of Moscow. Born into a poor clerical family in the village of Anga, near Irkutsk (south-central Siberia), John Popov received his early education from his father, the church sacristan. From 1806 to 1818 he attended the seminary in Irkutsk, where he was an outstanding student. During this period, his surname was changed to Veniaminov.

After his marriage, Veniaminov served as a priest in Irkutsk. When the Russian-American Company called for volunteers to serve as missionary priests, he at first refused, but changed his mind after hearing of the zeal of the Aleuts for the Christian message. In 1823 he set out with his wife, son, brother, and mother for the fourteen-month journey to Unalaska in the Aleutian chain. His first task there was to build his own house and a church.

Veniaminov studied the Aleutian language, creating an alphabet and teaching the Aleuts to read and write. One of the books he wrote in Aleut, *A Guide to the Way to the Heavenly Kingdom*, was translated into Russian and went through forty-six editions. Veniaminov was also an outstanding scientist and anthropologist. A series of his articles, published in Russia, aroused so much interest that they also were published in French and German journals. His three-volume *Notes on the Islands of the Unalaska District* remains a basic reference work. Veniaminov's main interest, however, was in the conversion of the Aleuts. His careful work in evangelism and teaching left an established church.

After ten years in the Aleutians, Veniaminov was transferred to Sitka in southeast Alaska and commenced work among the Tlingit, a tribe previously hostile to both Russian culture and religion. Upon completing fourteen years of mis-

sionary service, he returned to Russia to oversee the printing of his Aleutian translations. When his wife died, he entered the monastic ranks, taking the name Innokentii. He was then made bishop of the newly created Diocese of North America and Kamchatka (1840).

Innokentii returned to Sitka in 1841, but was not content to direct affairs from his episcopal residence. He traveled widely over his scattered diocese, visiting areas that had rarely seen a priest. He changed his episcopal residence three times to be on the front line of the missionary expansion of his diocese. As the result of his efforts, the synod enlarged his diocese and elevated him to archbishop in 1850.

In 1868, at the age when he normally would have retired to a monastery, Innokentii was elected primate of the Russian church. This honor was truly a crown to his life's work, as it enabled him to submit new plans and to press for reforms in the Orthodox church. The most far-reaching project was the establishment of the Orthodox Missionary Society (1870), which put Russian missionary activity on a sound financial footing for the first time. The society was an attempt to mobilize the whole church by the formation of local diocesan committees, and its work continued into the twentieth century.

Innokentii's influence extended beyond his own dioceses. He encouraged Nikolai Kasatkin, Orthodox chaplain to the Russian consulate in Hakodate, Japan, to learn Japanese. Kasatkin credited Innokentii's advice and example as part of the impetus that resulted in the establishment of the Japanese Orthodox church. Innokentii worked toward the establishment of an independent Diocese of North America with the episcopal see to be located in either San Francisco or New York. He was canonized on October 6, 1977, by the Holy Synod of the Church of Russia and honored with the title Evangelizer of the Aleuts and Apostle to America.

BIBLIOGRAPHY

Innokentii's writings and a biography are available in seven volumes in *Innokentii Mitropolit Moskovskii i Kolomenskii, Tvoreniiia* (Writings) and *Pis'ma* (Letters), edited by I. P. Barsukov (Moscow, 1883–1888; Saint Petersburg, 1897–1901). The only full-length biography in English is Paul D. Garrett's *Saint Innocent, Apostle to America* (Crestwood, N.Y., 1979). Valuable information is found in Josef Glazik's *Die russisch-orthodoxe Heidenmission seit Peter dem Grossen* (Münster, 1954), Hector Chevigny's *Russian America: The Great Alaskan Venture, 1741–1867* (New York, 1965), and Gregory Afonsky's *A History of the Orthodox Church in Alaska, 1794–1917* (Kodiak, Alaska, 1977). Two articles in *Saint Vladimir's Theological Quarterly* refer to materials in the U.S. Library of Congress: Vsevolod Rocheau's "Innocent Veniaminov and the Russian Mission to Alaska, 1820–1840," 15 (1971): 105–120; and Dmitry Grigorieff's "Metropolitan Innocent: The Prophetic Missionary," 21 (1977): 18–36; they are excellently researched introductions.

INQUISITION, THE

This entry consists of the following articles:

THE INQUISITION IN THE OLD WORLD
THE INQUISITION IN THE NEW WORLD

INQUISITION, THE: THE INQUISITION IN THE OLD WORLD

The long history of the Inquisition divides easily into two major parts: its creation by the medieval papacy in the early thirteenth century, and its transformation between 1478 and 1542 into permanent governmental bureaucracies—the Spanish, Portuguese, and Roman Inquisitions, all of which endured into the nineteenth century. What unites both phases is the struggle of the Roman church to suppress various forms of heresy, which ecclesiastical authorities believed posed serious threats to proper worship in Christian communities. It is worth stressing that, for more than five centuries, the average European Christian approved of the activities of the Inquisitions. Inquisitions had no coercive powers and depended upon the cooperation of local people to denounce heretics and upon local secular authorities to punish them. Interestingly, the inquisitors never composed written justifications for their activities because their basic purpose seemed self-evidently beneficial to good Christians. Until the mid-eighteenth century, inquisitors almost never encountered serious opposition, except in rare situations where heretics either formed a majority or were deeply embedded among the local ruling class. For example, in the sixteenth century the Spanish Inquisition was perceived as an instrument of foreign tyranny by both Catholic Neapolitans and heretical Netherlanders; in both cases an ultimately successful “popular” opposition was manipulated by local magnates.

Originally directed primarily against the Cathars of southern France, inquisitors spread to many other regions of continental Europe; only places that rarely used canon law, such as the British Isles or Scandinavia, never had them. After eliminating the Cathars, papally appointed inquisitors targeted primarily Waldensians, but they also investigated a variety of other heretics, including the Spiritual Franciscans and the antinomian “Brethren of the Free Spirit” (who never existed as an organized sect) as their activities spread into northern Italy, Germany, the Low Countries, Switzerland, Bohemia, and northeastern Spain. After 1430, inquisitors in Switzerland and Germany further broadened their range of activity by helping define and punish the newly defined offence of diabolical witchcraft (it was a “mixed” crime, punishable by either inquisitors or secular courts). Meanwhile, in a different kind of extension, King Ferdinand and Queen Isabella created the Spanish Inquisition to punish Jewish behavior among Spain’s large and influential communities of converted Jews; a generation later, another state-run Inquisition was created in Portugal for the same purpose. After 1520 the spread of Protestantism gave fresh business to inquisitors wherever the institution survived or was rebuilt, as in Italy. After 1540 the largest group of heretics arrested in Spain

were baptized Muslims, who outnumbered converted Jews and Protestants combined.

MEDIEVAL INQUISITIONS: ORIGINS AND PROCEDURES. Unlike Byzantium, the Latin church felt no need to develop any special proceedings against heretics until the twelfth century. Two separate but almost simultaneous developments created the preconditions for a revived and intensified investigation of religious dissenters. The first development was the great increase in heresy in several parts of western Europe. By the twelfth century, the Cathars appeared to form the most dangerous group. However, their political strength was broken after 1209 by a new type of crusade, directed against internal rather than external enemies of the church. As Catharism was gradually eliminated during the thirteenth century, it was replaced by other, more widespread, forms of organized heresy, not imported from the East but indigenous. Consequently, defining and condemning heretical beliefs and practices occupied much of the papacy’s attention at the time of the third and fourth Lateran councils in 1179 and 1215.

Ever since the conversion of Constantine and the Christianization of the Roman Empire, heresy had been a punishable crime. The primary responsibility for disciplining heretics rested with the hundreds of bishops scattered across Christian Europe, who had the authority to use the ancient Roman procedure of *inquisitio*, involving *ex officio* investigations. Throughout the Middle Ages and beyond, each bishop had the right to name an inquisitor for his diocese or even perform the duty himself. The most famous medieval inquisitorial register, describing the elimination of the last Cathar heretics in the Pyrenean village of Montailou, was kept by an early fourteenth-century French bishop who later became pope. Subsequently, the trial of a famous German mystic, Meister Eckhardt (1328), was begun by the archbishop of Cologne, but it was later transferred to the papal court. Moreover, although much inquisitorial history has been written as though papally appointed inquisitors were the only zealous pursuers of heretics in medieval Europe, the inquisitors were always less violent, and often less zealous, than secular judges in dealing with heretics. The Albigensian Crusade, with its powerful (if apocryphal) slogan “Kill them all! God will know his own!” offers vivid testimony of just how bloodthirsty ordinary Christians could be.

However, the spread of heresy led the medieval papacy, whose power had increased steadily since the Investiture controversy, to substitute its own central authority for local episcopal inquisitions, especially during the pontificate of Innocent III (1198–1216). Like most major medieval popes, Innocent had been trained in the relatively new discipline of canon law; it was a fateful coincidence that church law, based largely on Roman precedents, developed simultaneously with heresy in twelfth-century western Europe. With his decretal of 1199, *Vergentis in senium*, Innocent III took the crucial step of combining heresy with the Roman-law doctrine of *lèse-majesté*, thereby accusing heretics of treason against God and enabling both ecclesiastical and secular authorities

to apply the full force and procedure of Roman law against them. In 1207, Innocent III also ordered that the houses of convicted heretics be torn down and their property (like that of convicted traitors) confiscated: one part of the proceeds went to the accuser, one part to the court, and the remainder was invested in building prisons. After the murder of a papal legate in 1208, Innocent III proclaimed the Albigensian crusade, a twenty-year campaign that decisively tilted the long-term trend of the Western Christian clergy away from persuasion of unbelievers in favor of coercion.

Besides the growth of heresy and canon law, one must also consider the role of the new Dominican order, founded in 1220, before one can understand the thirteenth-century papal Inquisition. Saint Dominic did not intend to punish heretics but to convert them—his order, founded in the old Cathar capital of Toulouse, was (and is) named the Order of Preachers. But the founder's stress on proper theological training, together with the fact that the new order was directed by a minister-general responsible only to the pope, made the Dominicans uniquely valuable in Rome's ongoing struggles against heresy, and they quickly became inquisitors as well as preachers. In 1231, Gregory IX commissioned a German Dominican monk as a judge-delegate under papal authority with orders to go anywhere he wished to preach and also to "seek out diligently those who are heretics or reputed as heretics." Although medieval inquisitors included Franciscans and other clerics, Dominicans dominate medieval inquisitorial history, from the diary-like notices of the early Dominican Pelisso describing the activities of inquisitors at Toulouse in the 1230s to the careers of Tomás de Torquemada and the German authors of the *Malleus maleficarum* in the 1480s. It is certainly no accident that both major fourteenth-century codifiers of inquisitorial procedure, a Frenchman and a Catalan, were Dominicans.

Between 1230 and 1260, such legally trained popes as Gregory IX and Innocent IV completed the process of transforming their delegated judges into papal inquisitors of heretical pravity. The process was piecemeal; no single papal bull or other document provides an exact official date of birth for the medieval papal Inquisition, but some benchmarks do emerge. Besides his commission to the German Dominican prior, in 1231, Gregory IX also issued the decretal *Excommunicamus*, clarifying that death was the appropriate punishment for unrepentant heretics. A short manual for papally delegated inquisitors, produced at Toulouse around 1248 or 1249, outlined the correct procedures they should follow, from their original appointment through the pronouncement and implementation of final sentences against convicted heretics. In 1252, Innocent IV's bull *Ad extirpandum* legalized the use of torture to detect heretics and compel confessions, although inquisitors could not apply it themselves.

The basic procedures of medieval inquisitors changed relatively little between the short guide of 1248–1949 and the far more elaborate manual of Nicolas Eymeric a century and a quarter later, and they changed even less between

Eymeric and the nineteenth century. Nearly always, inquisitorial procedure followed normal rules of canon law. The newly appointed inquisitor, normally assigned to a particular region for a specified number of years, began with a sermon that urged his listeners to denounce suspected heretics and announced a grace period, during which voluntary confessions that implicated fellow heretics would be accepted without legal consequences. Officially, repentance rather than punishment of heretics remained the primary purpose of the inquisitors: they wanted heretics to abjure their errors, accept whatever penance was imposed upon them, and assist the Inquisition. Hearings were held in private, but the penances were always pronounced in public, with all physical punishments carried out by local secular officials.

Inquisitorial punishments emphasized shaming and humiliating heretics rather than killing them. No first offender who confessed at any stage of the trial was executed; only obdurate heretics and repeat offenders were "relaxed to the secular arm." Most offenders were therefore punished with some mixture of monetary fines, whippings, and imprisonment (a sentence of "perpetual" imprisonment generally meant seven years and could be reduced for good behavior). Many penitents were also forced to wear special garments in public. Like secular courts under Roman law, inquisitors could also condemn heretics who were already dead or absent, after which they might burn a skeleton or an effigy and confiscate property from their heirs.

Much ink has been shed, especially in Protestant countries, about the legal iniquities of the Inquisition. However, in many ways it provided a fairer form of justice than most secular courts or jury trials. Because inquisitors, unlike secular courts, were ultimately concerned with saving the soul of the accused, their prisons were better run than secular jails (clever prisoners tried to be transferred from secular to inquisitorial jurisdiction, but never the reverse). Inquisitors discounted the truthfulness of confessions wrung out under torture, and generally employed torture only against heretics who had already been convicted in order to discover their associates and leaders. Although defendants had no right to choose their own lawyers, inquisitors provided prisoners ample opportunity to name and discredit all of their personal enemies and provided a free "public defender" to avoid formal miscarriages of justice. In terms of procedure, inquisitors were unusual in only one significant respect: as their earliest guide of 1248–1949 insisted, "we do not deviate from established legal procedure except that we do not make public the names of witnesses." They did this in order to protect the well-being of their informers, employing a simpler and cheaper method than the current witness-protection program used in the contemporary United States. This famous provision served the Inquisition well: for six hundred years, there was no serious effort to change it.

Another common misconception about both the medieval and modern Inquisitions is their role in the ugly record of European witchcraft. It is undeniable that fifteenth-

century inquisitors in the Swiss and northern-Italian Alps contributed heavily to transferring the notion of a satanic conspiracy from secret nocturnal meetings of heretics to gatherings of old women who cast harmful spells on their neighbors. Moreover, a German inquisitor produced the *Malleus maleficarum*, Europe's first and most famous practical guide to conducting a witch trial. However, theory is one thing and practice is another. Even in the fifteenth century, most "witches" were executed by secular rather than inquisitorial courts. After 1530, fewer than fifty were executed by all Inquisitions combined, a tiny number compared with the nearly forty thousand burned by Europe's secular courts. Around 1615 the Spanish Inquisition, not usually considered an example of "enlightened" justice, pioneered the skeptical investigation of material evidence and confessions of witchcraft.

THE "MODERN" INQUISITIONS: SPAIN, PORTUGAL, ROME.

Two major limitations of the thirteenth-century inquisitorial system should be stressed. One was institutional: papally appointed inquisitors lacked any permanent organization or central direction. The other limitation was geographical: in several parts of medieval Europe, including places with numerous heretics, such as England or northern France, heresy cases were tried by secular rather than inquisitorial courts. In its long history, the papally appointed Inquisition eventually managed to partially overcome the first difficulty, but it never overcame the second. In fact, after the Protestant Reformation, the Inquisition's sphere of activity shrank considerably: a generation after a German Dominican inquisitor gave Europe its first detailed guide for trying witches in 1486, the Inquisition disappeared from the Holy Roman Empire and Bohemia after Martin Luther's successful defiance of papal inquisitors. In 1539 a former inquisitor was himself burned for heresy by a secular court at Toulouse, the Inquisition's original birthplace in southern France. After the mid-sixteenth century, the Inquisition's history was essentially reduced to Mediterranean Catholic Europe, south of the Alps and Pyrenees, where it had been reshaped into three government-controlled permanent institutions—the Spanish, Portuguese, and Roman Inquisitions.

The oldest and most famous of the "big three" was the Spanish Inquisition. Chartered by the papacy in 1478 at the request of Spain's "Catholic kings," Ferdinand and Isabella, in order to discipline and punish crypto-Jewish behavior among their uniquely large and prominent population of *conversos*, or baptized Jews, the Spanish Inquisition held its first *auto-de-fe* at Seville in 1480 and lasted until its third and final abolition in 1836. The most important departure separating Spain's Holy Office from its medieval predecessors is that its inquisitor-general (Torquemada was the first) was named and paid by the king and merely approved by the pope. Since the inquisitor-general appointed all of his local subordinates, the Spanish Inquisition became effectively a branch of the royal government (in Spanish court protocol, the Supreme Council of the Inquisition occupied fifth place in the hierarchy). The Inquisition was also the only royal in-

stitution that functioned identically in both Isabella's Castile and Ferdinand's Aragon. With few and insignificant exceptions, the papacy exercised no supervision or control over its operations.

The overall pattern of its activities falls into four stages. A bloodthirsty first half-century was directed almost exclusively against Spain's numerous and influential communities of baptized Sephardic Jews (*conversos*). Incomplete records suggest at least two thousand of them were burned, along with an approximately equal number of cadavers and effigies (one of Torquemada's earliest rules insisted that "trials of the living must never take precedence over trials of the dead"). Although the scale of its public slaughter of "Judaizers" was unprecedented in the annals of the medieval Inquisition, such numbers appear small by modern standards; the number of Jews killed at Nazi gas chambers in one August day of 1944 probably surpassed the number of officially Christian *conversos* executed by Spain's Holy Office across three and a half centuries.

Afterwards, between 1530 and 1630, the Spanish Inquisition greatly extended the range of its investigations while reducing its relative severity: about ten people were executed each year throughout the entire system. Spanish *conversos* now accounted for barely 10 percent of those arrested or executed, while Protestants (mostly foreigners) and especially *Moriscos* (baptized Muslims) comprised its principal heretical prisoners. The following century (1630–1730) saw a greatly reduced rate of activity—annual executions dropped from ten to two—and Judaizers, now principally immigrants from Portugal, again became its primary victims, especially during a final and little-explored surge of cruelty in the 1720s. In the final century of its activities, the Spanish Inquisition did relatively little damage to anyone before Napoleon abolished it in 1808; it was restored twice, once after Spanish liberals abolished it in 1821.

The range of the activities of the Spanish Inquisition from 1530 to 1630 is indeed remarkable. During this century every tribunal held regular *autos de fe* with a variety of prisoners, and submitted annual reports to the Supreme Council (enabling historians to follow their activities with remarkable precision). Most of its forty thousand prisoners were ordinary Spaniards, often charged with blasphemy or infringing the requirements of the Council of Trent; the Holy Office became the coercive arm of Spanish confessionalization. Many were charged with "mixed" crimes, like bigamy or witchcraft, which could be tried in either royal or inquisitorial courts. Men accused of homosexual or bestial "sodomy," another "mixed" crime, which inquisitors judged in only three northeastern tribunals, accounted for 170 burnings, almost as many as Protestantism or Islam. However, the Spanish Inquisition executed only two dozen witches—a smaller number than those killed for "opposition to the correct and proper functioning of the Holy Office" (e.g., by murdering its witnesses, reminding us again why their names were concealed). In a truly bizarre extension of inquisitorial logic, sev-

eral dozen prisoners were charged with heresy for smuggling horses to French Protestants.

The Spanish Inquisition developed extremely long arms, both geographically and socially. During the reign of Philip II, it expanded to the Americas, establishing tribunals in Mexico City, Lima, and later Cartagena (Colombia). Although most subjects of the Aztec and Inca empires were converted to Catholicism before the Inquisition was introduced, the Holy Office cannot be considered a form of “colonial” exploitation; Philip II had ruled that native Americans were not “reasonable people” (*gente de razón*) and thus not subject to the Inquisition, although mestizos and baptized African slaves were subject to it. Meanwhile, its reach in Spain was boundless; almost nobody was exempt from the Spanish Inquisition, one of the few European institutions that—then or now—overrode all social privileges. The Inquisition imprisoned and punished numerous powerful *conversos* holding important offices; it also punished some high-ranking “pure-blooded” Spaniards, including an archbishop of Toledo, Philip II’s most trusted private secretary, and the grandee who headed the crusading order of Montesa. In such cases, the Spanish Inquisition did not take lives, but it most certainly ruined careers.

When Ferdinand and Isabella expelled Spain’s remaining practicing Jews in 1492, many of them took the short and easy route across the Portuguese border. Five years later, when Portugal’s king wanted to marry a Spanish heiress, Spanish diplomatic pressure provoked forcible Christian baptisms of thousands of these Jewish religious refugees. It was only a matter of time before Portugal’s extremely unconverted “New Christians” encountered a virtual carbon copy of the Spanish Inquisition, which the papacy chartered in 1536 and reinforced in 1547.

The Portuguese Inquisition was even more closely connected to the crown than the Spanish model. Portugal’s first inquisitor-general was the son of a king and eventually became king himself. During the Spanish occupation of Portugal (1580–1640), his second successor combined the offices of viceroy and inquisitor-general. Because Portugal was much smaller than Spain, the Portuguese Inquisition had only three European tribunals, but it expanded overseas even sooner, establishing a tribunal in India by 1560. Although relatively harmless after 1774, Portugal’s Holy Office lasted until 1821. Its remarkably well-preserved records show a tenacious obsession with Judaizing by descendants of the New Christians of 1497: they accounted for almost 80 percent of all trials in mainland Portugal and for almost all of its thousand-plus public executions between 1540 and 1761. In India, Asian Christians formed the majority of the Portuguese Inquisition’s thirteen thousand prisoners, but even here most of those burned were Sephardic New Christians.

In 1542, frightened by the Protestant movement in Italy, Pope Paul III created the Roman Inquisition with the bull *Licet ab initio*. Like its Iberian counterparts, it was restricted by some “enlightened” princes after the mid-

eighteenth century and suffered greatly from Napoleon; but unlike them, it revived quickly and held jurisdictional power until the unification of Italy in 1861. The Roman Inquisition continues to exist in toothless form, being renamed the Congregation for the Doctrine of the Faith in 1965. Because Italy remained politically divided until 1861, the Roman Inquisition was far more complicated than either Iberian model. The Congregation of the Holy Office, a standing committee of cardinals, often presided by the pope in person, regulated a network that eventually included forty-six tribunals; a few of them (e.g., Malta) lay outside Italy, while large parts of modern Italy (e.g., the entire south plus Sicily and Sardinia) avoided it. Within Italy, the Inquisition resembled a governmental agency only in the ten tribunals of the papal states. The Roman Inquisition’s largest single cluster (fifteen tribunals) belonged to the Venetian Republic, which imposed various restrictions on its standard operations; minor restrictions affected the Inquisition elsewhere. Whereas almost all inquisitors in Spain or Portugal after 1550 were secular clerics trained in canon law, the Roman Inquisition followed medieval precedents by appointing only Dominican (or sometimes Franciscan) monks.

Unlike the Spanish and Portuguese tribunals, the origins of the Roman Inquisition had nothing to do with baptized Jews; perhaps not coincidentally, there is enough evidence to affirm that the Roman Inquisition seems far less bloodthirsty than either Iberian tribunal. The likeliest guess is that the Roman Inquisition put only about 125 people to death, the vast majority being Italian Protestants; about half of its victims were burned in Rome and two dozen others were drowned secretly in Venice. The Roman Inquisition succeeded in its original purpose of controlling Protestantism on the Italian peninsula, but it did so through suffocation rather than burning it out. The most convincing explanation for the Roman Inquisition’s success is the co-optation of confessors, who were required to denounce to the Holy Office any penitent admitting any unorthodox behavior.

Public knowledge of the operations of the Roman Inquisition was hampered until 1997 by the closing of its central archive and the disappearance of the records of its trials, which were mostly destroyed in Napoleon’s time. To some extent, the lack of quantitative information about the Inquisition’s operations has been offset by the exceptional richness of a few famous trials that have been studied in exemplary depth. The Roman trial of the Florentine mathematician and astronomer Galileo Galilei in 1634, which ended with the condemnation of Copernican astronomy and the perpetual house arrest for this aged prisoner, surely constitutes the single most famous case in the history of any Inquisition. Its execution in 1600 of another Copernican and renegade Dominican monk, Giordano Bruno, is known to all Italians. The Inquisition’s two trials of Domenico Scandella, better known as “Menocchio,” an obstinate and argumentative miller in a remote village of northeastern Italy who was finally executed in 1599, have made him almost as famous.

DID THE INQUISITIONS SUCCEED? Both the medieval and modern forms of the Inquisition compiled a mixed record with respect to their principal purposes. Dominic saw Cathars as the most dangerous heretics of his day, and a century after his death they had been eliminated. However, the Waldensians, who constituted the principal targets of the fourteenth- and fifteenth-century inquisitors, outlasted their persecutors and still exist today. The record of the early modern state-run Inquisitions is comparably mixed. It is difficult to deny that the Roman and Iberian Inquisitions played a major role in eliminating all serious traces of native Protestantism in Mediterranean Europe. But the baptized Muslims of Spain could not be coerced into behaving like Tridentine Catholics, and their expulsion in 1609 constituted a major defeat for the Spanish Holy Office.

The Spanish Inquisition's record with Sephardic *conversos* remains controversial. One could assert, however, that the relative scarcity of prosecutions after 1530 implies that most of them, like the ancestors of Saint Teresa of Avila or the Jesuit general Diego Laynez, became proper Catholics. Although Portuguese New Christians resisted Tridentine Catholicism far more stubbornly, part of the explanation is surely the circumstances of their 1497 "conversion," and Portuguese historians claim that their persecution across eight or nine generations has social rather than religious roots.

BIBLIOGRAPHY

Much useful material can still be found in Henry Charles Lea's three-volume *History of the Inquisition of the Middle Ages*, first published in 1887, and his four volumes on the Spanish Inquisition, but they must be supplemented by more recent scholarship. Edward Peters's *Inquisition* (Berkeley, 1988) provides an excellent introduction to the long-term history and mythology of this institution, while the best survey of the modern state-run Inquisitions is Francisco Bethencourt, *L'Inquisition à l'époque moderne: Espagne, Italie, Portugal, XVe-XIXe siècle* (Paris, 1995). Both have extensive bibliographies. The standard English-language history is Henry Kamen, *The Spanish Inquisition: A Historical Revision* (New Haven, Conn., 1997). By far the most interesting case study of the medieval Inquisition is Emmanuel Le Roy Ladurie, *Montaillou: The Promised Land of Error*, translated by Barbara Bray (New York, 1978), and for the modern Inquisitions, Carlo Ginzburg, *The Cheese and the Worms: The Cosmos of a Sixteenth-Century Miller*, translated by John Tedeschi and Anne Tedeschi (Baltimore, 1980).

WILLIAM MONTER (2005)

INQUISITION, THE: THE INQUISITION IN THE NEW WORLD

The institution developed by the Roman Church to combat heresy in the Old World operated in several forms in the

New World. Initially organized under papal authority in Italy, France, and Germany during the thirteenth century, inquisitions emerged under royal auspices in the Iberian kingdoms of Castile, Aragon, and Portugal in the late fifteenth and mid-sixteenth centuries. They became part of the colonial apparatus in Spanish and Portuguese America from the sixteenth to the early nineteenth century. Although its procedures and goals were essentially the same in both hemispheres, the institution confronted several unique and changing circumstances in the New World and adapted its organization, jurisdictions, and operations accordingly. Beginning with the delegation of authority to a series of bishops and missionaries, the Holy Office of the Inquisition (as the institution was known in both Spain and Portugal and their dominions) expanded its presence with periodic visitations, networks of operatives, and, in Spanish America, autonomous tribunals, alongside related episcopal activity that addressed heterodoxy among the indigenous inhabitants. Over the course of three centuries, the institution went from being a modest instrument for rooting out heresy to facilitate evangelization, to an elaborate bureaucratic organization attempting to control moral, spiritual, and intellectual life in the colonies. But it experienced a long period of decline before its final dissolution in the face of Enlightenment ideas and independence movements.

OLD WORLD ORIGINS. Although the Spanish and Portuguese Inquisitions functioned as separate entities in the New World, they shared similar and somewhat related origins. The Catholic Monarchs, Ferdinand of Aragon and Isabella of Castile, initially brought the institution to the Iberian peninsula to help effect the political and religious consolidation of what would become Spain, an area in which three faiths—Christianity, Judaism, and Islam—had co-existed for several centuries. Responding to growing public anti-Semitism and allegations that certain "New Christians" or *conversos* (recent converts to Roman Christianity from Judaism or Islam) were still practicing their old religion, the monarchs secured a series of papal bulls, between 1478 and 1483, authorizing the appointment of inquisitors and the establishment of tribunals and a Supreme Council (known as the Suprema) under royal control. By the summer of 1492, the Inquisition had executed many wealthy *conversos* and confiscated their assets, while Isabella and Ferdinand had given Jews the ultimatum of conversion or expulsion. Tens of thousands went to Portugal, only to face a similar order to convert in 1497 from King Manuel. After a series of negotiations and papal concessions between 1531 and 1547, the Portuguese Holy Office came into being, along the lines of the neighboring Spanish model, with regional tribunals and a General Council under the monarchy's control. Both countries would integrate the institution into the ecclesiastical and political machinery of their colonial empires.

The inquisitorial procedures employed in the New World had already taken their general form in the peninsula before crossing the Atlantic. When an inquisitor first came to an area or embarked upon a new campaign, the populace

was assembled in the main church for a solemn ceremony. In a display of unity between the temporal and spiritual realms, the civil and ecclesiastical authorities offered their deference and support to the inquisitor, who issued an “edict of faith” or monitory, warning of the iniquities of heresy and outlining the various offenses that the Holy Office then considered to be heretical or otherwise unorthodox or immoral. Confessions and denunciations were solicited and duly recorded during a prescribed grace period, after which the inquisitor summoned additional testimony about those implicated in the information gathered.

Three credible denunciations judged sufficiently culpable by examiners (theologians and canonists) could lead to an individual’s arrest and the initiation of proceedings. The identity of accusers and witnesses was kept secret, although a list of enemies provided by a suspect could bring about the nullification of denunciations thought to stem from enmity. Defendants had the benefit of legal counsel and the opportunity to address the charges and testimony against them. Those who confessed to offenses were assigned penance, while those who denied the charges were incarcerated and often had their assets sequestered to cover their maintenance while in custody. Inquisition officials sometimes employed prison informants and torture to obtain additional information or confessions before or after conviction or sentencing. Penalties for minor offenses included fines, flogging, and various lighter forms of penance aimed at publicly humiliating the offender. Those convicted of major heresies usually had their assets confiscated and could receive exile, imprisonment, galley service, or even death in the case of an obstinate or repeat offender. The Inquisition’s goal was to get convicts to admit their guilt, receive absolution, and then be reconciled with the Church. Unreconciled heretics were turned over or “relaxed” to the secular authorities for civil execution, usually by fire at the stake, although last-minute confessions normally entitled the condemned to strangulation before burning.

The procedural process culminated with another solemn ceremony, in this case an *auto-da-fé* (act of faith), in which the authorities announced and implemented the sentences of all the recent offenders, who appeared in penitential garb before the entire community. The public humiliation of penitents in these elaborate and dramatic affairs served as a deterrent against heterodoxy and an effective form of social control. Although these general procedures stayed remarkably constant throughout the colonial period, several changes in terms of organization, jurisdiction, and the delegation of authority occurred during the early decades of colonization, as the Holy Office experimented with ways to extend its reach across the Atlantic.

EARLY DEVELOPMENT IN THE AMERICAS. Inquisitorial activity initially arrived in the Americas to assist in Spain’s evangelical mission. From the Church’s perspective, Spanish dominion in the New World derived from a papal donation that required the monarchs of Castile to oversee the conver-

sion of the indigenous population to Christianity. When Columbus returned to the Caribbean in 1493 on his second voyage, he brought a missionary contingent led by Bernardo Buyl, an apostolic delegate who, some have speculated, may have possessed and exercised inquisitorial authority during his brief stay in the hemisphere. In 1510, Columbus’s son Diego Colón, as governor of Hispaniola, asked the king for the authority to name an inquisitor on the island. Bartolomé de las Casas, in turn, called for the introduction of the Inquisition to help protect Indian neophytes and mentioned that two heretics already had been burned in a report he addressed to Cardinal Francisco Ximénez de Cisneros in 1516. Ximénez, who was then inquisitor general as well as regent of Castile, responded the following year with an order granting bishops “in the Indies” apostolic powers to deal with heretics and apostates observing the “sects of Moses and Muḥammad.” Many years later, Henrique, the king and inquisitor general of Portugal, would likewise extend apostolic authority to the bishop of Salvador da Bahia in Brazil.

These delegations of apostolic inquisitorial authority to bishops in the Americas were expressly granted in addition to the episcopal authority they already held, as ecclesiastical judges or ordinaries, to conduct inquisitions within their own dioceses. Along with bishops, the Holy Office also selected monastic superiors to be inquisitors, thus the first two appointed in the New World in 1519 were Alonso Manso, the bishop of San Juan (Puerto Rico), and Pedro de Córdoba, the Dominican vice-provincial in Hispaniola. In 1522, as the activity of Spanish conquistadores and missionaries moved farther away from the established dioceses and sees in the Caribbean, Charles V obtained the *Omnimoda*, a papal concession extending episcopal powers to monastic prelates more than two days’ travel from a bishop, which allowed them to try inquisitorial cases as ordinaries. These apostolic, episcopal, and monastic forms of inquisitorial authority and jurisdiction would be variously combined at different times and places, as the Holy Office and church officials tried to adapt to rapidly changing developments in the New World.

Regarding the first two inquisitors, Córdoba died in 1521, but Manso continued to execute his charge in the Caribbean until 1539. In 1524 the Holy Office attempted to erect a Tribunal of the Indies under the San Juan bishop. It was expected to support itself, as the peninsular tribunals did, from penitential fines and the assets confiscated from heretics, which in the Americas then, and for some time to come, were meager at best. Manso nevertheless managed to appoint auxiliaries in the islands and conduct various cases against the colonists, although contemporaries complained to the Crown that the activities of the bishop and his delegates were often arbitrary, despotic, and in excess of their authority.

As the Spanish colonial project advanced onto the continent, inquisitorial activities expanded alongside the conquest and conversion effort. After the 1521 fall of Tenochtitlan, the great Mesoamerican urban center in the Basin of Mexico, priests accompanying the conquistador Fernando Cortés

tried various cases, the earliest known involving an Indian accused of concubinage. A short time later, Franciscan missionaries began arriving to convert the millions of native inhabitants in what would become the viceroyalty of New Spain. Their superior Martín de Valencia served as inquisitor and apparently was the first to condemn Indians to the stake for practicing idolatry. Beginning in 1526, a series of Dominican prelates exercised the charge, including Domingo de Betanzos, who tried several cases of blasphemy among the conquistadores and settlers, and Vicente de Santa María, who held the first auto-da-fé in Mexico and relaxed two New Christians for “Judaizing.”

The next apostolic inquisitor was Juan de Zumárraga, a Franciscan who became the first bishop of Mexico and whom the Holy Office authorized to organize an episcopal tribunal. Between 1536 and 1543 he conducted at least 152 cases involving European, Indian, black, and *mestizo* (mixed European and Indian) men and women, whose range of offenses included blasphemy, bigamy, heretical propositions, Judaism, Protestantism, idolatry, sorcery, and superstition. He initiated several proceedings against Indian practitioners and elites he considered impediments to the evangelization campaign. The most notable of these cases culminated in the 1539 execution of Carlos Ometochtzin, a prominent native leader accused of being a “dogmatizing heretic,” and earned Zumárraga a reprimand from the Suprema and the removal of his inquisitorial authority.

VISITATIONS AND AUTONOMOUS TRIBUNALS. The activities of both Zumárraga and Manso prompted a reexamination of inquisitorial organization in Spanish America at a time when the Crown was attempting to implement the reforms lobbied for by Las Casas in the “New Laws” of 1542. Faced with these excesses and economic realities in the New World, the Holy Office abandoned the idea of tribunals in favor of the inquisitorial *visita*, an official visitation or inspection conducted for a given amount of time. In 1544, the Spanish crown sent Alonso López de Cerrato to the Caribbean and Francisco Tello de Sandoval to New Spain to inspect all colonial institutions and enact various reforms. The Holy Office made them both apostolic inquisitors and assigned Tello, who had served as an inquisitor in Toledo, to review the finances and cases of Zumárraga’s tribunal (especially the trial of Carlos Ometochtzin), and Cerrato to do the same with Manso’s record. In 1546, Pedro de la Gasca, of the Suprema, was sent to the new viceroyalty of Peru to put an end to the civil unrest among the colonists and to reassert royal authority. While the institution clearly had become an important tool in the monarchy’s strategy to consolidate colonial rule, it would be nearly another quarter-century before the Inquisition would achieve its definitive form and presence in Spanish America.

Within a few years, the *visitadores* had left and inquisitorial authority reverted back to the bishops and monastic prelates acting as ordinaries. In New Spain, at least, it seems that the Crown made a conscious effort to avoid further abuses

when appointing the Dominican theologian Alonso de Montúfar, who had been an examiner for the Holy Office in Spain, as the new archbishop of Mexico. For the next two decades episcopal activity increased throughout Spanish America, but during these years of the Counter-Reformation and the Council of Trent (1545–1563), it focused primarily on the growing presence of Protestants and on maintaining orthodoxy among the clergy, leaving the Indians relatively unmolested.

This was not the case, however, in the wave of monastic activity in New Spain during the 1560s that climaxed with a brutal inquisition directed by Diego de Landa in Yucatan. Claiming authority from the *Omnimoda*, the Franciscan provincial unleashed a reign of terror upon thousands of Maya Indians after finding some “idols” in a cave. Many were tortured, harshly disciplined, or committed suicide to avoid interrogation, before the first bishop of Yucatán, Francisco de Torral, intervened and sent Landa back to Spain to answer for his actions. Although Landa eventually was exonerated, this episode was influential in Philip II’s decision to establish permanent tribunals of the Holy Office in Spanish America and to remove the Indians from its jurisdiction.

In 1569, after an accumulation of petitions complaining of abuses against both Spaniards and Indians, increased penetration of foreign Protestants and Protestant literature, and a general concern about unorthodox and immoral behavior in the colonies, the Crown authorized the creation of two autonomous tribunals, directly subordinate to the Suprema, in the capitals of the American viceroyalties. The Mexico City tribunal had jurisdiction over all of New Spain, from New Mexico to Panama to the Philippines, while the Lima tribunal in the viceroyalty of Peru covered all of Spanish South America until 1610, when a third tribunal was established in Cartagena to monitor New Granada (roughly Colombia and Venezuela) and the Caribbean islands.

Although numbers varied over time and by location, the bureaucracy of these tribunals consisted of inquisitors, prosecutors, secretaries, notaries, examiners and consultants, defense advocates, constables, jailers, and guards, as well as treasurers and accountants to manage the revenue and property acquired in fines and confiscations. The vast territorial jurisdictions of the American tribunals also required establishing provincial branches, each run by a commissary, who initiated investigations and proceedings, transferred serious cases to the main tribunal, and was assisted by a notary, a constable, and a jailer. Inquisitors and commissaries additionally relied on a network of lay officials known as familiars, dispersed throughout the empire, who supplied intelligence and assisted in investigations and arrests. The Holy Office also maintained inspectors in the ports to prevent prohibited books and suspected heretics from entering the colonies and fugitives from leaving.

In contrast to the experience in Spanish America, the Portuguese never created an autonomous tribunal in the New World. Although the Crown in 1560 established an

overseas tribunal at Goa (India) whose jurisdiction extended from the Cape of Good Hope to the Far East, Portugal's Atlantic holdings, including Brazil, remained under the authority of the Lisbon tribunal. In 1579, Cardinal-King Henrique invested apostolic inquisitorial authority in the bishop of Salvador da Bahia, António Barreiros, to act in consultation with a group of Jesuit theologians, just one year before Philip II consummated his claim to the Portuguese throne and ushered in sixty years of Spanish rule. Although the Holy Office of both countries maintained their autonomy in the "Iberian Union," the Spanish Crown nevertheless pressured the Portuguese institution to proceed against *conversos* suspected of "Judaizing" in the colonies. Until that time inquisitorial activity in Brazil had been minimal and many New Christians and Jews emigrated there to avoid persecution in Portugal, or paradoxically were exiled there by the Holy Office. From the very beginning of colonization, they had been instrumental in providing capital and developing enterprises, first in brazilwood, then sugar production, and finally gold mining in the eighteenth century. In 1591, the General Council of the Inquisition appointed Heitor Furtado de Mendonça to conduct the first Holy Office visitation (*visitação*) and he spent five years dispatching cases in the northeast provinces. In 1622, Philip IV ordered the creation of an autonomous tribunal in Brazil that never materialized, most likely because of opposition from Flemish interests in Pernambuco and Bahia, the Jesuits, and even the Holy Office itself, which preferred to maintain peninsular control over inquisitorial activity in the colony. Thus the Lisbon tribunal continued its vigilance through a combination of periodic Holy Office visitations, diocesan visitations conducted by bishops and ordinaries, and a network of commissaries and familiars, who identified and forwarded suspects to Portugal. Although inquisitors investigated a wide variety of offenses, most of the cases originating in Brazil involved New Christians, many of whom were denounced by "Old Christians" for purely economic or political reasons.

INQUISITIONAL ACTIVITIES AND OFFENSES. Pursuing "Judaizing" *conversos* was also a priority for the new tribunals in Spanish America, as many Portuguese New Christians had entered Peru, New Spain, and New Granada during the period of the Iberian Union (1580–1640). In Mexico, there were two periods of heightened activity against *conversos*. The first came between 1585 and 1601, and was dominated by the prosecutions of members and associates of the Carvajal family. The second occurred from 1642 to the great *autos-da-fé* of 1647 and 1649, when the Holy Office arrested and tried hundreds of New Christians, fearing their subversion after Portugal's extrication from Spanish hegemony in 1640. In Peru, such activity steadily increased until peaking with the "Great Conspiracy" and the extraordinary 1639 *auto-da-fé* in Lima.

Protestantism, since the beginning of the Counter-Reformation, was considered especially dangerous and had been one of the primary reasons for establishing the American tribunals. Generically referring to it as the "heresy of Lu-

ther," the inquisitors made little distinction between Lutherans, Anglicans, Calvinists, and other sectarians and usually dealt with them all quite harshly. The condemned offenders included pirates, smugglers, and shipwreck victims captured on Iberian-American shores, French Huguenot interlopers (notably in Florida and Brazil), and English and German merchants who ventured, legally or illegally, into Spanish and Portuguese ports and cities in the New World. By the mid-seventeenth century, however, prosecutions of foreign Protestants had declined because of treaty obligations and pragmatic commercial concerns.

Inquisition officials also worried about blasphemy and the spread of various "heretical propositions" associated with Protestantism or other Old World movements. Common examples were denying the virginity of Mary, criticizing the veneration of saints and images, questioning the existence of Purgatory or the notion of original sin, claiming that the Mass had no significance or that excommunication offended God, or rejecting the sacrament of confession or the Eucharist. Blasphemy cases, ubiquitous throughout the colonial period, also included slaves who renounced their faith in the heat of being punished or mistreated by their masters. In terms of Old World movements, in addition to Erasmians, the Inquisitors were especially concerned with adherents of Spanish Illuminism and Quietism, who aspired to spiritual perfection through mystical reflection and direct union with God, because they often counseled others to forsake the Church's intercessory role. Moreover, believing they were incapable of sin in that direct union sometimes led to sexual transgressions. These *alumbrados*, many of them pious women (*beatas* and nuns), included mystics and visionaries, who issued prophecies and claimed to receive divine revelations. They were steadily prosecuted well into the eighteenth century, along with their followers and supporters, many of whom were members of the regular clergy. Inquisitors also tried clerics for other theological errors and a variety of offenses related to church discipline and the sacraments, such as improperly celebrating the Eucharist, marrying while in the consecrated state, or soliciting sex in the confessional.

The Holy Office also began to monitor familial and sexual morality, especially after the Council of Trent's pronouncements upholding the dissolubility of monogamous marriage and the prohibition of deviant moral behavior that was quite common in the New World. Bigamy, for example, was one of the most frequently tried offenses, surely reflecting the long distances, poor communications, and personal mobility in the Americas. Concubinage also thrived in the colonial environment, between conquistadores and Indian women, masters and slaves, native elites and subjects, and others preferring cohabitation to marriage. Although jurisdiction over adultery, fornication, and sodomy (at this time meaning any sexual activity not destined for procreation) traditionally resided with the civil authorities, the Holy Office increasingly intervened in cases it deemed to have heretical implications because they contradicted Tridentine decrees.

Thus inquisitors were often more interested in disciplining offenders for certain commonly held beliefs—such as fornication was not a sin, or living together was better than being in a bad marriage—than for the acts themselves.

Other inquisitorial activity related to the indigenous inhabitants and their Christian conversion. The evangelization of the Indians in the New World was uneven at best and often involved “guided syncretism,” indigenization, and transculturation, which incorporated many native beliefs and practices, and “relapses” were common. When establishing the American tribunals, the Spanish Crown decided that the transgressions of these neophytes should not elicit the Holy Office’s harsh sentences for heresy or apostasy, but rather more lenient responses from episcopal authorities acting as ordinaries. The Holy Office, nevertheless, continued to investigate Indian heterodoxy to gather evidence against the rest of the population who *were* under its jurisdiction. It turned its findings over to the episcopal courts, which had established their own special tribunals under various names (Provisorato de Indios, Tribunal de Naturales, Inquisición Ordinaria). Headed by the *provisor* or vicar general of the diocese, these Indian tribunals also employed inquisitorial methods, issued edicts of faith, held autos-da-fé, and meted out penitential sentences that included haircutting, flogging, incarceration, forced labor, and exile for offenses such as bigamy, concubinage, idolatry, superstition, and sorcery. In Peru, successive Lima archbishops, especially Pedro de Villagómez (1641–1671), augmented these tribunals with systematic extirpation campaigns in indigenous communities conducted by a *visitador* of idolatries. Throughout their existence, these episcopal tribunals often clashed with the Holy Office over jurisdictional matters, which became even more complicated when cases of Indian bigamy and polygamy were returned to its authority in 1766. In Brazil, baptized Indians had always remained under the Portuguese institution’s jurisdiction. During the first visitation in Bahia, the *visitador* Furtado investigated a Tupi millenarian sect called Santidade that integrated elements of Catholicism, prophesied the end of slavery and the Portuguese, attacked colonial interests, and astonishingly enjoyed the protection of a powerful planter and sugar mill owner. In both Spanish and Portuguese America, however, the vast majority of inquisitorial cases concerned whites, blacks, *mestizos*, and other racial mixtures rather than the Indians.

By the seventeenth century, the population was becoming more diverse with increasing European immigration, continued importation of African slaves, and a rising number of American-born whites, *mestizos*, and other miscegenational combinations. In this dynamic biological and social environment a vibrant and fluid popular culture emerged in which African, American Indian, and European beliefs and practices were creatively combined in ways that deviated from the orthodoxy that the Holy Office was entrusted to maintain. This was especially apparent in the genre of cases the inquisitors variably classified as superstition, sorcery (*hec-*

hiceria feitiçaria), or witchcraft (*brujeria bruxaria*), which involved male and female practitioners of all racial backgrounds. This activity included astrology, fortunetelling, necromancy, and other forms of divination, the healing practices of *curanderismo*, the use of magic, spells, curses, charms, bundles, talismans, and potions for protection or to elicit desired effects, and the use of peyote, mushrooms, coca, and other psychoactive substances to induce visions, revelations, and prophecies. Early on, the inquisitors vigorously pursued such offenses as true heresies thinking they were dealing with supernatural powers linked to the devil, but years later when this activity had grown beyond all control, their interest waned as they increasingly attributed these cases to chicanery and ignorance among the lower classes.

By the late seventeenth century, inquisitorial activity had already peaked and was in a state of decline. In Spanish America, a shift occurred around mid-century as cases of major heresies such as “Judaizing” and Protestantism gave way to lesser offenses among the clergy and the masses, resulting in diminishing revenue in fines and confiscations for the Holy Office and fewer and less elaborate autos-da-fé. During the eighteenth century, although bigamy and solicitation still dominated the docket, the institution started to take on a more political character as Spain’s Bourbon monarchs sought to defend royal absolutism from liberal republicanism. The Index of Prohibited Books, begun in 1559, was now burgeoning with works from the Enlightenment, which inquisitors tried to suppress by monitoring imports, presses, booksellers, and private collectors. In the latter half of the century, cases citing “disloyalty to the Crown,” sedition, Freemasonry, materialism, or republicanism as heretical offenses began to appear and during the turbulent years of popular uprisings and independence wars the Holy Office sided with the royalists. Nevertheless, after years of bitter financial and jurisdictional disputes, even the local royal authorities showed little sympathy when the Spanish Inquisition was suppressed in 1813 and definitively abolished in 1820. In Brazil, after some late activity involving *conversos* in Minas Gerais, the last Holy Office visitation occurred in 1763, several decades before the liberal Portuguese Constituent Assembly dissolved the institution in 1821.

BIBLIOGRAPHY

There is no comprehensive, combined treatment of Spanish and Portuguese inquisitorial activity in the New World. Most scholarship, with the notable exception of *The Inquisitors and Jews in the New World* (Coral Gables, FL, 1974) and other works by Seymour B. Liebman, focuses on one or the other empire.

For Spanish activity, the pioneering works of Chilean historian José Toribio Medina should still be consulted. His *Historia del Tribunal del Santo Oficio de la Inquisición de Lima* (Santiago, 1887), . . . *en Chile* (Santiago, 1890), . . . *de Cartagena de las Indias* (Santiago, 1899), . . . *en las provincias del Plata* (Santiago, 1899), and . . . *en México* (Santiago, 1905) represent the first systematic treatments of the Inquisition in these areas and have reappeared in subsequent editions with

useful retrospective introductions by leading scholars. Another important early synthesis is found in Henry Charles Lea's *The Inquisition in the Spanish Dependencies* (New York, 1908), which emphasizes the institution's jurisdictional conflicts, financial corruption, and inhibiting effect on intellectual development. The apostolic, episcopal, and monastic activities before the arrival of the first permanent tribunals are covered in Medina's *La primitiva inquisición americana, 1493–1569* (Santiago, Chile, 1914), a topic that Álvaro Huerga has reexamined in "La pre-inquisición hispano-americana, 1516–1568," in *Historia de la Inquisición en España y América*, edited by J. Pérez Villanueva and B. Escandell Bonet (Madrid, 1984–2000), vol. 1, pp. 662–700. This three-volume set contains other useful essays concerning general historiography, documentary sources, administrative and economic structures, and regional activities of the Holy Office in the Spanish colonies. Additional scholarship along these and other lines is found in *Cultural Encounters: The Impact of the Inquisition in Spain and the New World*, edited by Mary Elizabeth Perry and Anne J. Cruz (Berkeley, Calif., 1991), and *Women in the Inquisition: Spain and the New World*, edited by Mary E. Giles (Baltimore, Md., 1998).

Within Spanish America, New Spain has received the most attention owing to the survival of nearly all the records generated by the Mexico City tribunal. Richard E. Greenleaf's "Historiography of the Mexican Inquisition: Evolution of Interpretations and Methodologies," in *Cultural Encounters*, pp. 248–276, provides a good overview of this scholarship, and his *Zumárraga and the Mexican Inquisition, 1536–1543* (Washington, D.C., 1961) and *The Mexican Inquisition in the Sixteenth Century* (Albuquerque, 1969) cover early activity. Inga Clendinnen examines Landa's monastic inquisition in *Ambivalent Conquests: Maya and Spaniard in Yucatan, 1517–1570* (Cambridge, U.K., 1987). On Mesoamericans, the Holy Office, and the Provisorato, see Greenleaf's "The Inquisition and the Indians of New Spain: A Study in Jurisdictional Confusion," *The Americas* 22, no. 2 (1965): 138–166. Solange Alberro offers a broad synthesis and statistical analysis of the most active phase of the Mexican tribunal in *Inquisition et société au Mexique, 1571–1700* (Mexico City, 1988), also available in a Spanish translation of the same year. For the later period, see "The Inquisition in Eighteenth-Century Mexico," *The Americas* 22, no. 2 (1965): 167–181, by Lewis A. Tambs, and Ruth Behar's "Sex and Sin, Witchcraft and the Devil in Late-Colonial Mexico," *American Ethnologist* 14, no. 1 (1987): 34–54. The two-volume *Inquisición novohispana*, edited by Noemí Quezada, Martha Eugenia Rodríguez, and Marcela Suárez (Mexico City, 2000), presents a diverse sampling of research at the close of the millennium.

Concerning other Spanish-American areas, Carlos Esteban Deive studies Caribbean activity in *Heterodoxia e inquisición en Santo Domingo, 1492–1822* (Santo Domingo, Dominican Republic, 1983). For the Cartagena tribunal, see Fermina Álvarez Alonso's *La Inquisición en Cartagena de Indias durante el siglo XVII* (Madrid, 1999) and Anna María Splendiani's four-volume *Cincuenta años de Inquisición en el Tribunal de Cartagena de Indias, 1610–1660* (Bogotá, Colombia, 1997). On the Lima tribunal, see the three-volume *La Inquisición de Lima, 1569–1820* (Madrid, 1989–1998) by Paulino Castañeda Delgado, Pilar Hernández Aparicio, and René Millar

Carvacho. The extirpation campaigns in Peru are examined by Kenneth Mills in *Idolatry and Its Enemies: Colonial Andean Religion and Extirpation, 1640–1750* (Princeton, N.J., 1997).

For Brazil, Sonia A. Siqueira's *A inquisição portuguesa e a sociedade colonial* (São Paulo, Brazil, 1978) provides a good institutional overview. Denunciations and confessions from the first visitation have appeared in several editions, the most recent being *Denúncias e Confissões de Pernambuco, 1593–1595*, edited by José Antônio Gonsalves de Mello (Recife, Brazil, 1984), and *Confissões da Bahia*, edited by Ronaldo Vainfas (São Paulo, Brazil, 1997). Vainfas reconstructs a native millenarian movement from inquisition documents in *A heresia dos índios: catolicismo e rebeldia no Brasil colonial* (São Paulo, Brazil, 1995) and looks at sexual morality and the institution in *Trópico dos pecados: moral, sexualidade e Inquisição no Brasil* (Rio de Janeiro, Brazil, 1997). Regional studies of New Christians and the Inquisition include José Gonçalves Salvador's *Cristãos-novos, Jesuítas e Inquisição: aspectos de sua atuação nas capitânicas do Sul, 1530–1680* (São Paulo, Brazil, 1969), Anita Novinsky's *Cristãos novos na Bahia* (São Paulo, Brazil, 1972), and Neusa Fernandes's *A Inquisição em Minas Gerais no século XVIII* (Rio de Janeiro, Brazil, 2000). Geraldo Pieroni provides an interesting study of Portuguese penitents exiled to Brazil in *Os excluídos do reino: a Inquisição portuguesa e o degredo para o Brasil colônia* (São Paulo, Brazil, 2000).

SCOTT SESSIONS (2005)

INSECTS appear in mythology not only as the gods, often as the creators of the world, but also as messengers to the gods. They serve sometimes as the agents of creation and frequently function as symbols of the human soul. Moreover, some insects, such as cicadas, beetles, and scarabs, often symbolize rebirth, resurrection, or eternal life.

According to the Lengua, a South American tribe of the Gran Chaco, a god in the shape of a huge beetle created the world and peopled it with mighty spirits. He holds aloof, however, from his creation and is not invoked in prayer. The butterfly is often worshiped as a god, sometimes as the creator. In Madagascar and among the Naga of Manipur, some trace their ancestry to a butterfly. According to the Pima of North America, at the time of beginning the creator, Chio-wotmahki, assumed the form of a butterfly and flew over the world until he found a suitable place for humankind.

It is, however, the spider that plays a prominent part in the myths of North American Indians; it appears as the creator (e.g., among the Sia Pueblo Indians) or culture hero, or at least as the trickster (among the Dakota Indians). The Jicarilla Apache believe that at the time of beginning, when creatures lived in the underworld, the spider spun a web in the hole leading up to the earth and, together with the fly, came up on it before the people emerged. The spider and the fly were told by the Holy Ones to make a web and extend it to the sky in order to bring down the sun. According to the Navajo, Spider Man and Spider Woman are supernatural

beings who instructed their mythical ancestors in the art of weaving and established the four warnings of death. The spider is also conspicuous in West African myths. In some myths, he is creator of the world; in others, he plays the role of culture hero, as in the stories in which he steals the sun. However, his usual role is that of a crafty and cunning trickster who prospers by his wits.

In Hindu mythology, ants are compared to a series of Indras. One day Indra in his palace receives a visit from a boy dressed in rags, who is Viṣṇu in disguise. While the boy speaks of the innumerable Indras who people the innumerable universes, a procession of ants appears in the great hall of the palace. Noticing them, the boy suddenly stops and bursts into laughter. "What are you laughing at?" asks Indra. The boy replies, "I saw the ants, O Indra, filing in long parade. Each was once an Indra. Like you, by virtue of pious deeds each one ascended to the rank of a king of the gods. But now, through many rebirths, each has become again an ant. This army is an army of former Indras."

In West Africa, ants are often viewed as the high god's messengers. In the Romanian creation myth, the bee serves as God's messenger. It also helps God to complete his creation with advice that it overhears from the hedgehog. Although the angry hedgehog puts a curse on it, condemning it to eat only ordure, God blesses the bee so that the filth it eats may become honey.

The bee is still an important symbol in Islam. The Qur'an explicitly mentions it as a model of an "inspired" animal, and both Muḥammad and, even more, 'Alī are connected in folklore with the pious and useful bee. Honey becomes sweet, it is said, because the bees hum blessings for the Prophet as they go about their work.

In some earth-diver myths, which speak of the origin of the earth from the primordial waters, insects serve as agents of creation. According to the Garo of Assam, the goddess Nosta-Nōpantu was to carry out the work of creation on behalf of the god Tattaro-Robuga. To get a particle of soil from the bottom of the primeval ocean, she sent in turn a large crab, a small crab, and a dung beetle. Only the dung beetle succeeded in bringing up a little clay, and from this Nosta-Nōpantu formed the earth. The Semang Negritos of the Malay Peninsula (such as the Menik Kaien, Kintak Bong, and Kenta tribes) similarly believe that the earth was brought up from the primeval ocean by a dung beetle, although in this version the insect seems to have dived on its own initiative. Among the Shan of Burma, the divers are ants. In North America, too, insects are known as earth divers among the Cherokee. In contrast to earth-diver myths are stories that speak of the celestial origin of the earth—as in the Indonesian and Micronesian cosmogonies—and in these myths, too, insects play an important role. The Toba and the Batak of Sumatra, for example, have preserved the tradition that a swallow and a large dung beetle brought down a handful of earth from the sky.

While bees, ants, and dragonflies often symbolize the souls of the dead, the image of the butterfly as the human soul is widely diffused in Europe, Asia, and the Pacific islands. The early Greeks sometimes depicted the soul as a diminutive person with butterfly wings, and later as a butterfly. A similar belief was shared by the Romans. The Maori of New Zealand believe that the soul returns to earth after death as a butterfly, and in the Solomon Islands a dying person, who has a choice as to what he will become at death, often chooses to become a butterfly. In Japan, the motif has been incorporated into *nō* dramas, and in the world of Islam, it is one of the favorite images of Sufism: The moth that immolates itself in the candle flame is the soul losing itself in the divine fire.

The cicada, on account of its metamorphosis, was well known in ancient China as a symbol of rebirth or renewal of life. According to the Arawak of Guyana, at the time of beginning the creator came down to earth to see how humankind was getting along. But humans were so wicked that they tried to kill him; so he deprived them of eternal life and bestowed it instead on animals that renew their skin, such as serpents, lizards, and beetles. In ancient Egypt the scarab, a beetle of the Mediterranean region, was identified with the sun god Khepri and thus became a symbol both of the force that rolled the sun across the heavens and of the rising sun, self-generated. Scarab amulets made of green stone set in gold were placed over the heart of the dead during the funeral ceremony as a sign that just as the sun was reborn, so would the soul of the deceased be born again.

Insects are not always viewed as beneficent creatures. According to Northwest Coast Indians such as the Tlingit, the Haida, and the Tsimshian, mosquitoes are pests that originated from the ashes of an ogre's burned body. The same motif is found among the Ainu and in southern China. In Japanese mythology, spiders appear as a symbol of the evil forces that were subjugated by the heavenly gods before the imperial dynasty—and with it, Japan—was established.

MANABU WAIDA (1987)
Revised Bibliography

INSPIRATION. As it appears in the general history of religions, *inspiration* may be defined very broadly as a spiritual influence that occurs spontaneously and renders a person capable of thinking, speaking, or acting in ways that transcend ordinary human capacities. Taken in this general sense, the term refers to a form of religious experience that is widely distributed and found in a great variety of forms. Taken more narrowly, the actual term (which derives from the Latin *inspirare*, "to blow or breath upon") implies the existence of a *spiritus*, or "breath," that is breathed into the soul and enlivens it. Although inspiration may often be conceived in this way, its specificity as a religious phenomenon should not be located in an explicit notion of spiritual breath or divine spirit, because such a notion may be absent in cases where one would still wish to speak of inspiration. In such cases, inspiration may be attributed to the direct action of a god, or even to the effects of a particular kind of food or drink. What is common to most forms of inspiration is its efficacy as an influence that motivates or facilitates action, very often in the form of inspired speech or song. An understanding of inspiration is thus closely related to questions of human agency and its transcendence.

The use of the term *inspiration* should probably be restricted to those cases where human agency is transformed but not totally displaced. This would make it possible to contrast inspiration with trance, because in the latter, human agency is simply canceled out, to be replaced in most cases by the action of a possessing god, spirit, or ancestor. The notion of possession itself, however, which need not always imply a state of trance, can sometimes be used to account for particularly intense experiences of inspiration. The essential point is that inspiration never leads to a state of complete dissociation of the personality and subsequent amnesia, as is the case with trance.

One of the earliest historical forms of inspiration is that experienced by the *ṛṣis*, or poet-seers, of the *Rgveda*. In composing their liturgical hymns, the *ṛṣis* often invoked their gods to inspire their songs. The gods Mitra and Varuṇa, the Aśvins, and in particular the god Agni were asked to stimulate the visions of the seers, to animate or impel their speech,

and to set their songs in motion. The verbs used in these contexts convey a sense of power: *cud-* ("to impel, animate"); *tuj-* ("to strike, instigate"); *hi-* ("to set in motion, urge on"). One of the most famous verses in the *Rgveda* (3.62.10), the so-called Gāyatrī, is in fact a prayer addressed to the god Savitr, asking for such inspiration, a verse that is recited daily by traditional Hindus. This example of the inspiration of the Vedic seers may be taken as representative of the phenomenon of inspiration among the ancient Indo-European peoples generally. This is illustrated most clearly by the Indo-European root **vat-* ("to blow," or more figuratively, "to inspire"). This root not only appears in the *Rgveda* and *Avesta* but also underlies the Latin word *vates* ("seer, prophet, poet") and the Old Irish term *fáith* ("prophet, seer").

The Vedic seers also sought inspiration by drinking a special beverage called soma, which was used in the Vedic sacrifice. Here again one finds Indo-European parallels, both in the *haoma* found in ancient Iran, and in the legendary mead of the ancient Scandinavians, a drink that was believed to make anyone who drank it a poet or a visionary.

Whatever its exact source, inspiration is experienced as an impulse that either comes from without, or, if it arises within, does so spontaneously, in independence of the individual's will. In principle this trait distinguishes it from the ecstatic experience that is the defining characteristic of shamanism, because once initiated the shaman is capable of acting on his own and controlling the inhabitants of the spirit world for his own ends. This autonomy is what gives shamans their importance as "technicians of the sacred." The inspired person is by contrast much more dependent upon a continuing source of inspiration.

In classical India an experience of spontaneous inspiration was sometimes referred to as *pratibhā*, a "flash" of insight that arose in an inexplicable way, free of any intentional cognitive act on the part of the subject. In Indian poetics, *pratibhā* became a common term for poetic inspiration. In early Mahāyāna Buddhism, it took on a distinctly religious value, referring to the inspired speech uttered spontaneously by a disciple in praise of the Buddha. It is, however, in later Hindu devotionism (*bhakti*) that are found the most striking Indian examples of inspiration. In inspired states that are often hard to distinguish from states of possession, the devotees of Viṣṇu and Śiva (the Āḷvārs and Nayanars) composed thousands of hymns in honor of their god. One of the greatest of these, the Vaiṣṇava poet-saint Nammāḷvār (9th–10th century CE), spoke of being taken over by Viṣṇu, such that Viṣṇu himself sang through his mouth (*Tiruvāymoli* 7.9.1).

The connection of inspiration with poetry and song was also recognized in ancient Greece, where poets sought the inspiration of the Muses, much as their Indian counterparts might pray to Sarasvatī, the goddess of eloquence. Plato describes the inspiration of the Muses as a form of mania ("madness or frenzy") and makes the poet's art wholly dependent upon it. It is because the poet's mind is "taken away" by the gods that the reader knows that it is the gods

who speak and not the poet himself. Poets are “simply inspired to utter that to which the Muse impels them” (*Ion* 534).

Poetic inspiration was not the only type of mania that Plato recognized, however. In the *Phaedrus* (265a–b) he distinguishes four different types: Besides the poetic mania of the Muses there are also prophetic, teletic (ritual), and erotic forms of mania. All save the teletic are described as forms of inspiration (*epipnoia*). In many respects the most important of these was prophetic or mantic inspiration, the type given by Apollo for purposes of divination, and most important in connection with the Delphic oracle. Although the famed “frenzy” of the Pythia at Delphi has been shown to be largely a product of the literary imagination (Lucian’s in particular), there is no doubt that she was at all periods believed to be genuinely inspired by the god Apollo. Mention should also be made of those enigmatic, quasi-legendary figures of antiquity, the sibyls. Their inspired oracles were collected and consulted at Rome, while many later Christians looked upon some of them as pre-Christian prophecies of Christ.

The fact that Plato classified both poetic and prophetic inspiration as forms of madness is indicative of the Greek tendency to view inspiration in terms of possession, a tendency already noted in South India, and which is very widespread among tribal cultures the world over. Inspiration as a form of mania is conceived of as a manifestation of *enthousiasmos*, literally the presence of a god within the inspired person, that is, possession. It shall be seen that this theory exerted an important influence on some early Jewish and Christian theories of inspiration, only later to be rejected.

In the ancient Near East inspiration was closely associated with the phenomenon of prophecy. In its earliest form, the Near Eastern prophet served primarily as a counselor of the chief or king, giving advice in the form of inspired oracles. His role was distinguished from that of the cultic priest by the fact that the latter employed technical means of divination while the prophet relied primarily on inspiration. The more familiar figure of the prophet as the inspired critic of both king and cult derives from the later history of prophecy in Israel, where the prophet became the divinely elected spokesman of Yahveh. The ecstatic behavior and utterances of prophets such as Saul, Elijah, and Elisha were the effect of the powerful spirit (*ruah*) of God. In the later, so-called classical prophets the experience of inspiration is less violent and takes on the character of a close personal encounter.

In general the role of the prophet in this more familiar noncultic sense and the nature of inspiration as a religious phenomenon seem to be very intimately connected. The spontaneity and dynamism that characterizes inspiration achieve an almost paradigmatic realization in the figure of the itinerant prophet, who feels free to confront the established centers of power in the name of his god. It is surely not by chance that some of the clearest instances of inspiration among the peoples of Africa are found among the Afri-

can tribal prophets who have appeared since the end of the nineteenth century in struggles against foreign domination. Prophetic inspiration, in one form or another, has historically been an important factor in a large number of nationalistic, nativistic, and resistance movements.

The experience of inspiration in the early Christian communities was interpreted as the outpouring of the Spirit predicted by the prophet Joel, and was dramatically symbolized by the descent of the Holy Spirit in a rush of wind and in tongues of fire at Pentecost (*Acts* 2). The inspiration of the Spirit brought with it a variety of ecstatic experiences, which included speaking in tongues and a revival of prophecy. In the light of such experiences, and given the Christian belief in the divinity of the Holy Spirit, it is not surprising that some early Christians found theories of inspiration congenial that were hardly distinguishable from theories of possession. Thus the apologist Athenagoras could say that the Spirit made use of the prophet as a flute player makes use of a flute. Justin Martyr also seems to have had a “mantic” view of inspiration. Such theories may well have derived from Philo Judaeus, who explicitly ascribed scriptural prophecy to divine possession, in this undoubtedly being influenced by Plato. As a whole, however, the Christian tradition resisted such notions, and from the time of Origen on affirmed the importance of the active involvement of the inspired subject.

The Christian theological concept of the Holy Spirit as a divine person gave the concept of inspiration a theological importance that it could not have in either Judaism or Islam, where the strong sense of divine immanence implied in such a notion was viewed with suspicion. This is made clear by the role ascribed to inspiration in the constitution of the scriptures of these three religions. While affirming the supreme authority of the Torah, the rabbis denied that it was inspired. Rather it was given directly to Moses by God verbatim. The intervention of an inspired author would have served only to weaken its authority. Only the Prophets and the Writings could properly be described as inspired. Similarly in Islam, a clear distinction is drawn between revelation (*wahy*), which is applied to the *verbatim* transmission of the Qur’an to Muḥammad through the angel Gabriel, and inspiration (*ilhām*), which is restricted to the inspiration of individuals on matters that are of primarily personal concern. In Christianity, by contrast, it is precisely the concept of inspiration that is traditionally invoked to account for the authoritativeness of scripture.

This should not be taken to mean, however, that the concept of inspiration is unimportant in either Judaism or Islam. The rabbinical notion of the *ruah ha-qodesh* (lit., “holy spirit”), while not to be confused with the Christian notion, nevertheless fulfills some of the same functions. It was used by the rabbis to explain prophetic inspiration, and was also believed to be present to holy souls, and in particular to those who taught the Torah in public. According to a Midrash, “All that the righteous do, they do with the power of *ruah ha-qodesh*” (*Tanhuma’ Va-yehi* 13).

In Islam the fact that the revelation made to Muḥammad is distinguished from the inspiration received by the individual believer should not prevent anyone from recognizing in Muḥammad an inspired prophet. Nor can one fail to note the similarity between the oracular structure of some of the earliest *sūrah*s of the Qurʾān and the inspired oracles encountered elsewhere in the history of religions, in particular among the *kāhin*, or soothsayers, of pre-Islamic Arabia.

The later Ṣūfīs recognized the validity of another type of ecstatic utterance, called *shatḥ*, which they believed to be divinely inspired. The saying of al-Hallāj, “Anā al-ḥaqq” (“I am the Truth”), is probably the most famous of such utterances, but one that unfortunately encouraged misunderstandings that eventually led to his death. Inspiration did not always take such a dramatic form, however. The experience of *ilhām* remained an essentially inner experience that was believed to be authoritative only for the saintly soul who received it as a gift from God.

These few examples must suffice to illustrate the variety of ways in which inspiration has been experienced from the earliest times down to the present day. Throughout human history are found such examples of men and women who are open to a form of experience that ultimately defies any attempts to explain, or even understand. Friedrich Nietzsche put it beautifully, in describing his own personal experience of inspiration: “One hears—one does not seek; one takes—one does not ask who gives: a thought suddenly flashes up like lightning, it comes with necessity, unhesitatingly—I have never had any choice in the matter” (Nietzsche, 1954).

BIBLIOGRAPHY

A broad view of inspiration in its variety of forms in the history of religions is provided by N. Kershaw Chadwick's *Poetry and Prophecy* (Cambridge, U.K., 1942) and Edwyn Robert Bevan's *Sibyls and Seers: A Survey of Some Ancient Theories of Revelation and Inspiration* (London, 1928). A more recent work by Gilbert Rouget, *Music and Trance: A Theory of the Relations between Music and Possession* (Chicago, 1985), while dealing primarily with possession trance, does have some interesting things to say about inspiration and is to be recommended.

Much information on inspired poets among Indo-European peoples can be found in *Indogermanische Dichtersprache*, edited by Rüdiger Schmitt (Darmstadt, 1968), although this book is aimed at the trained philologist. For a more accessible sampling of the hymns of the Vedic *ṛṣi*s, see Wendy Doniger O'Flaherty's *The Rig Veda* (Harmondsworth, U.K., 1981). The inspired speech of the Mahāyāna Buddhists is discussed by Graeme MacQueen in “Inspired Speech in Early Mahāyāna Buddhism,” *Religion* 11 (1981): 303–319 and 12 (1982): 49–65. On Nammālvār, see A. K. Ramanujan's *Hymns for the Drowning: Poems for Viṣṇu by Nammālvār* (Princeton, N.J., 1981), especially the very helpful afterword.

For a general view of inspiration among the Greeks, see E. R. Dodds's *The Greeks and the Irrational* (Berkeley, Calif., 1951). A more recent work by Joseph Fontenrose, *The Delphic Oracle* (Berkeley, Calif., 1978), proposes a fundamental revision of traditional views of the inspiration of the Pythia at Delphi. On the inspiration of the Muses, one may consult Eike Barmeyer's *Die Musen: Ein Beitrag zur Inspirationstheorie* (Munich, 1968).

A wealth of information on inspiration among the Greeks, Hebrews, and early Christians can be found in the article on *pneuma* in the *Theological Dictionary of the New Testament*, edited by Gerhard Kittel (Grand Rapids, Mich., 1968). Johannes Lindblom's *Prophecy in Ancient Israel* (Philadelphia, 1962) is also a rich resource. Johannes Pedersen's short study, “The Role Played by Inspired Persons among the Israelites and the Arabs,” in *Studies in Old Testament Prophecy* (Edinburgh, 1950), is helpful for the attention it gives to early Arabic sources. For rabbinical theories of inspiration, see Paul Billerbeck's “Der Kanon des Alten Testaments und seine Inspiration,” excursus 16 of the *Kommentar zum Neuen Testament aus Talmud und Midrasch*, by Hermann L. Strack and Paul Billerbeck (Munich, 1928). For inspiration in Islam, see Fazlur Rahman's *Prophecy in Islam: Philosophy and Orthodoxy* (London, 1958), Annemarie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N.C., 1975), and the articles on *wahy*, *ilhām*, and *shatḥ* in the *Shorter Encyclopaedia of Islam*, edited by H. A. R. Gibb and J. H. Kramers (Leiden, 1974).

Friedrich Nietzsche's account of his own experience of inspiration while engaged in writing his *Thus Spake Zarathustra* was included by his sister in her introduction to that work and is reproduced in the Modern Library edition of Nietzsche's major works, *The Philosophy of Nietzsche* (New York, 1954), pp. xix–xxxiii.

Revised Bibliography

INTELLECTUALS are persons who produce or intensively study intellectual works. Intellectual works are coherent complexes of symbolic configurations that deal with the serious or ultimately significant features of the cosmos, the earth, and human beings. An intellectual work is unified by logical connectedness and the substantive identity of its subject matter, and it is set forth in a conventional form.

Religious intellectual works are those that deal with transcendent powers and their verbal, physical, and inspira-

tional manifestations. They deal with the relations of transcendent powers to texts that are regarded as sacred, and with the influence of transcendent powers in the genesis and working of the cosmos, in human life and destiny, and in the norms that guide human action.

Religious activities, both intellectual and practical (i.e., religious practices), have as their objective the engendering or maintaining of a state of belief that comprises a relationship to transcendent powers. Religious intellectual activities, embodying this particular state of mind or belief, aim at attaining and transmitting knowledge or understanding of transcendent powers and their manifestations. The attainment of a religious state of mind encompasses practices such as the performance of prescribed rituals, the incantation of sacred songs, the reiteration of sacred words, and the ingestion, handling, and bearing of sacred objects. Such practical religious activities are infused with symbolic components and are hence intimately related to the intellectual religious activities that have constructed their underlying symbolic configurations. The intellectual elucidation of the meaning of practical religious activities and objects creates an intimate bond between the intellectual and practical spheres of religious activity.

Bodies of religious beliefs and practices differ, however, in the degree to which beliefs and practices have been elaborated and rationalized. Religions that are built around sacred texts are more susceptible to an elaborate variety of interpretations than are those that have no sacred texts. These elaborate interpretations are possible only on the basis of prolonged and intensive study by religious intellectuals who study the religious intellectual works that are central to the complex of beliefs espoused by the religious community and who produce works of their own.

“PRIMORDIAL” AND “WORLD” RELIGIONS. Not all religious communities, that is, communities with common religious beliefs and practices, cultivate or depend upon intellectuals. The majority of these religions without intellectuals are primordial religions, that is, the religions of societies that define themselves by locality and lineage and in which no written texts contain their fundamental ideas. Such religions have beliefs and ritual practices, but they do not have doctrines. Their religious beliefs remain centered on local, occasional, and functional deities. Their rituals often have been codified, as was the case with Roman religion, and they sometimes have developed priesthoods as distinct professional strata; but, having no sacred books, they generally have no religious intellectuals to construct doctrines that could become integrally connected with their ritual observances. The larger, differentiated, and literate societies that continue to adhere to their primordial religions have produced intellectuals, including religious intellectuals, but the latter have had no ecclesiastical role. In these societies, such as those of ancient Greece and Rome, the construction of theological-philosophical theories has been left to laymen whose theories remained outside the realm of religious practice and influence.

Both in theory and in fact, however, the line dividing primordial religions from “world” or “universal” religions, that is, doctrinal religions that have acquired their doctrines through the work of religious intellectuals, cannot be precisely delineated. A primordial religion could in principle acquire an intellectual constituent. Its mythological pantheon could be rationalized and its rituals given a more pronouncedly transcendent reference; its magical procedures could be given a more explicit symbolic interpretation. World religions contain much that has been taken from the primordial religions that were indigenous to the territories from which they emerged or into which they entered. Yet no primordial religions that were indigenous to the territories from which they emerged or into which they entered can be turned into world religions without sacred or canonical texts and without intellectuals to construct doctrine from these texts.

DOCTRINE. The world religions have been primarily doctrinal religions in which articles are defined and ritual observances prescribed; belief and observance are required of members. Buddhism, Christianity, and Islam are unqualifiedly such religions. Confucianism has no primordial qualifications: It is open to all who can study the classical texts. In Hinduism, one is in principle a Hindu by being born into a Hindu caste, but it is also a religion centered around sacred writings and the rituals prescribed in the sacred writings. In this respect, Judaism is also in a marginal position. It is certainly a religion of doctrines insofar as it has a tradition contained in a sacred text and elaborated by commentary, but it is also a primordial religion: A Jew is one who is born of Jewish parents. Nevertheless, both of these world religions, despite this primordial element, have allowed prominent places to religious intellectuals.

Although the world religions, once established, recruit their members from among the offspring of their existing members, in order for transmission and expansion to occur, there must be a doctrine that is susceptible to simplification and exposition. Even if the founder of the religion is, in Max Weber’s terms, an “exemplary” rather than an “ethical” prophet, this exemplification has to be transformed into expoundable and teachable doctrine as a condition of its expansion. The doctrine is precipitated into intellectual works; the construction of this doctrine is the accomplishment of religious intellectuals.

Primordial religions have expanded territorially with the movement of their adherents, but they have not expanded to become the religions of entire societies to which they were not indigenous. Having no doctrines, they could not become world religions.

The combination of the written works, commentary, and systematic speculations of religious intellectuals has given to the world religions an influence in world history that the fragmentary, unwritten, and inchoate beliefs of the devotees of primordial religions could not achieve. The self-confidence of the propagators of the world religions within

and outside the societies of their origin has rested, in part, on the collective consciousness of participation in a system of beliefs that answers urgent ultimate questions. It was difficult for the devotees of doctrineless religions to stand up against the forceful proclamations and denunciations of a world religion that possessed an elaborated and rationalized doctrine. To the charismatic force of the prophetic founder and his sacred text was added the derivative charismatic force of an elaborated doctrine that expanded the concentrated and intense charisma of the founder. Local primordial religions fell before the expansion of the world religions pushing outward from their centers of origin.

In contrast, world religions have been resistant to one another's expansion. The Chinese, for example, were fortified by the intellectually elaborated outlooks of Confucianism and Buddhism against the intellectual argument of Christian missionaries. The expansion of world religions has been made primarily at the expense of primordial religions that have had no significant intellectual rationalization to resist attacks from an intellectually elaborated world religion. As world religions have expanded, the primordial religions, as visible collective entities, have been all but obliterated. They have survived within this expansion only through their unacknowledged assimilation. Their traditions were powerful enough to survive in fragmentary form, but they were not sufficiently rationalized to be able to survive as recognizable wholes.

TRADITION AND ORIGINALITY. An affirmative attitude toward a particular tradition is inherent in the activities of religious intellectuals, because they claim to carry forward sets of beliefs that rest on the revelations of a founder, or a divinely engendered sacred text, or both. Religious intellectuals are committed to a tradition that continues, with some attenuation, the sacrality of the founding moment or period in the past. All subsequent truths must be demonstrably continuous with that sacred past event or sequence of events.

Originality in the world religions is admitted only for the founder of the religion or for the sacred scriptures in which the founder serves as the voice of a transcendent power. This conception of the originating sacredness of a body of scriptures does not acknowledge any subsequent originality by the religious intellectuals who take upon themselves the responsibility for expounding and interpreting them.

Prophetic—charismatic, founding, and renewing—originality is acknowledged in most world religions. Interpretative rationalizing originality is not acknowledged as originality. Yet originality does occur within the traditions of Buddhism and in the work of Jewish rabbis, Roman Catholic and Protestant theologians, Islamic theologians and Hindu philosophers. It is not, however, regarded as originality. It is treated either as clarification of unchanging doctrine or it is rejected as heretical. In addition to rationalizing interpretative originality, there is in the world religions the originality of the mystic who, while affirming his acceptance of

the most fundamental objects of the religion, breaks out of the constraints of rationalized theological doctrine and routine ritual.

Religious intellectuals are not less creative or less original than secular intellectuals who produce works of science, literature, and art that are appreciated for their creativity or originality. Because the meaning of a sacred text is not self-evident, interpretation is necessary. Interpretation is intended to discern the “true,” or preexistent, meaning of a sacred text. The successful discovery of this “true” meaning is perceived to be not an addition to existing knowledge but a reassertion and confirmation of an already existent truth. Nevertheless, a considerable degree of originality within the tradition might in fact be attained.

When intellectuals elaborate doctrines that are based on inherently problematic sacred texts, divergent and hence conflicting doctrinal currents of belief appear. Such conflicts have occurred in every world religion and have led to intense disputes until one current has become prevalent over the others and has been established as the orthodox position. There is, however, an important difference between a prevailing doctrine that is orthodox solely through a substantial intellectual consensus and a prevailing doctrine that is promulgated as orthodox by an authoritative institution. An authoritatively promulgated doctrine is a dogma. Where there is dogma, heterodoxies are proscribed, and their intellectual proponents are suppressed.

The authorities that the religious intellectuals must confront are the authority of the sacred writings and the doctrines formed from them, the authority of the religious intellectual community, and that of ecclesiastical institutions. In principle, the authority of the sacred writings is inviolable. In fact, however, the authority of these writings is the authority of the prevailing doctrinal tradition and of those who espouse it within the institution. Critical interpretation of sacred texts is thus perpetually a potential threat to the effective “official” authority of the religious institution.

Within more complex societies, even those of very restricted literacy, there have been some self-taught laypersons different in their occupation and status from the majority of religious intellectuals in their society. They may be called lay or amateur religious intellectuals. Sometimes they have been merchants or craftsmen, sometimes scribes, officials, or soldiers. These laymen have studied the texts zealously and sometimes arrived at conclusions different from the prevailing doctrines. They have also resented the pretensions of the officially acknowledged and self-assertive priestly, academic, or monastic religious intellectuals. Their dissenting interpretations of sacred writings have occasionally broken into passionate public dissent from the prevailing doctrines and from the priestly and academic representation of those doctrines. These autodidactic intellectuals, sometimes reinforced by renegades from the more established stratum of religious intellectuals, have often furiously denounced the main body of the priesthood as departing fundamentally from the “true”

meaning of the sacred texts. The priests, and especially the higher level of the priestly hierarchy, have been accused of excessive subservience to the ruling house and to the powerful landowning families.

Heterodox or dissenting doctrines have occasionally been the work of intellectuals within the priesthood itself. Such interpretations at first lived an “underground” life. Some of them were cultivated in seclusion by dissenting, autodidactic religious intellectuals. The latter have often been subtle, learned, and ingenious.

Among the greatest of these intellectuals who were critical of the priestly or orthodox interpretation have been those prophets who were founders of new religions, that is, religions that declared themselves to be distinct from the hitherto prevailing body of religious belief and its proponents. The Buddha, Jesus, and Muhammad were such prophets. They were the beneficiaries of new revelations or illuminations.

Jesus said he was divinely chosen to fulfill the mission of earlier prophets. The Buddha was a profoundly original prophet, but he too was a continuator of Hinduism. Muhammad claimed to be not only the recipient of a new revelation but to have realized more truly the religion of Abraham and Jesus. In contrast, Confucian scholars in China claimed no authority from revelation, and they did not bring forth prophets from their ranks.

There have also been prophets who have claimed to realize the true intentions of long-accepted doctrines against those who had falsified them. The Hebrew prophetic intellectuals did not claim at any time to found a new religion. They demanded the restoration of the religion of the Jews to its prior condition of purity. Martin Luther, John Wyclif, and the monastic reformers of Christian religious orders must be placed in the same category as the prophetic intellectuals who thought that their religious community had departed from its original meaning and had succumbed to the ways of the earthly world.

Religious intellectual traditions alter as they pass from region to region and from generation to generation. The world religions—Hinduism, Buddhism, Confucianism, Judaism, Christianity, and Islam—have experienced numerous doctrinal vicissitudes and variations. They have survived largely because their doctrines have been received and retransmitted with modifications and increments by religious intellectuals. Without the constant reaffirmation and modifications of doctrinal traditions by religious intellectuals, there could be no religious communities with more or less uniform practices and beliefs over extended periods and large geographical areas.

SECULAR AND RELIGIOUS INTELLECTUAL ACTIVITIES. In no large societies have religious intellectual activities been the only intellectual activities. Yet except in ancient Greece and Rome, most intellectual activities in the societies of the ancient world were carried on by religious intellectuals. In the modern age, the increased volume of intellectual works, the

increased differentiation of objects of intellectual activity, and the increased specialization of intellectuals in dealing with aspects of the world (which is now thought to be relatively independent of transcendent powers) have been associated with a great increase in the proportion of secular intellectuals and a recession of the jurisdiction of religious intellectuals.

In territories where autonomous intellectual traditions—both religious and secular—were well developed, religious intellectuals often assimilated intellectual traditions that lay outside their own religious tradition. This occurred, for example, in Christianity and later in Islam when they became established in the territory of Hellenistic civilizations. Christian intellectuals found affinities between their own Christian beliefs and Platonic, and later Aristotelian, philosophy. Islamic intellectuals quickly absorbed the Hellenistic philosophical and scientific knowledge that had been cultivated in Syria and other parts of the Middle East under the Seleucids and the Romans. By the end of the European Middle Ages, Christian religious intellectuals drew knowledge directly from ancient secular Western sources. By the seventeenth century, both the quantity and the intellectual authoritativeness of secular intellectual works gained the ascendancy. Religious intellectuals absorbed some of this secular knowledge and attempted to render it compatible with Christian belief.

The humanistic intellectuals of the Renaissance, taking up the traditions of the secular cultures of Greece and Rome, continued to be Christians, but their attention moved toward the study of earthly things. After the Reformation this differentiation and multiplication of secular intellectuals continued. Religious intellectuals also declined more and more in status in comparison with secular intellectuals.

Religious intellectuals now constitute a small minority of the intellectuals of European and American societies. Many of them have made very far-reaching concessions to the substantive and technical standards of secular intellectuals. They have accepted the findings of the research of physical and biological scientists and the approaches and analyses of secular historians and social scientists.

In modern times, religious intellectuals have confined their intellectual activities to religious objects in a restricted sense: theological studies, textual and historical analysis of sacred writings and their commentaries, the archaeology of sacred sites, church history and the history of religious doctrines, and closely related topics. But even within some of these restricted spheres of religious study, a secular criterion of validity has prevailed. Secular modes of study in the analysis of religious phenomena have become predominant, and in certain fields, such as church history, the history of doctrines, and the sociological and anthropological study of religion, the techniques of research and the interpretations of secular intellectuals have come to predominate.

For centuries, religious intellectuals were an integral part of the political life of their respective societies. The

earthly centers of power could not claim the legitimacy of their ascendancy without its attestation by religious intellectuals. It was thought that social order could be assured only if the earthly center was properly aligned with the transcendent center. The earthly centers called upon religious intellectuals for administrative services. The education of young persons and children was entrusted to religious intellectuals. There was, by and large, a relationship of mutual support between religious intellectuals, princes, and great landowners. In the bourgeois age, religious intellectuals became more critical of the new plutocratic elite and of the bourgeois order of society. In Western European countries and North America religious intellectuals increasingly joined with secular intellectuals in oppositional political activities.

In the once-colonial territories, now sovereign states, "traditionalistic," revivalistic religious intellectuals have become more active. In these countries, during the period of foreign rule, traditional religious intellectuals had been mainly passive toward the foreign rulers. Indigenous rulers enjoyed the same submission of intellectuals in Asian societies that remained independent. Such passivity among traditional religious intellectuals is no longer so common. In Iran, for example, they have succeeded in establishing a theocracy. In a few other Islamic countries, they have been influential enough to compel secular military and civilian rulers to designate their states as "Islamic" and to install "Islamic constitutions." Christian religious intellectuals in the formerly colonial societies have not been so active politically; in their religious intellectual activities, they have sought to overcome their "alien" situation by reinterpreting Christianity to render it compatible with indigenous cultural traditions.

In Western countries in the twentieth century religious intellectuals narrowed their intellectual activities in accordance with the prevailing tendencies toward specialization and professionalization. At the same time, they acquired many of the scientific, cultural, moral, and political traditions of the secular intellectuals. In many respects, religious intellectuals in Western countries have become very much like secular intellectuals.

EDWARD SHILS (1987)
Revised Bibliography

INTELLIGENT DESIGN studies features of objects that signal the action of an intelligent cause. Designed objects, like Mount Rushmore, exhibit characteristic features that point to an intelligence. Such features or patterns constitute *signs of intelligence*. Proponents of intelligent design, known as design theorists, purport to study such signs formally, rigorously, and scientifically. Intelligent design may therefore be defined as the science that studies signs of intelligence.

Intelligent design is controversial because it purports to find signs of intelligence in nature and specifically in biologi-

cal systems. According to the evolutionary biologist Francisco Ayala (2004), Charles Darwin's greatest achievement was to show how the organized complexity of organisms could be attained apart from a designing intelligence. Intelligent design therefore directly challenges Darwinism and other naturalistic approaches to the origin and evolution of life. Leading proponents of intelligent design include Michael Behe, Phillip Johnson, and William Dembski. Leading critics include Kenneth Miller, John Haught, and Michael Ruse.

Although intelligent design is incompatible with a naturalized, nonteleological understanding of evolution, it has no complaint against evolution *per se*. Intelligent design is compatible with common descent, the claim that all organisms trace their lineage to some last universal common ancestor. At the same time intelligent design is also compatible with special creation, the claim that organisms, except for small-scale evolutionary changes, were all separately created.

Given this flexibility, intelligent design is not readily shoehorned into the usual spectrum of explanations for evolutionary change, which places naturalistic evolution at one end, scientific creationism at the other, and theistic evolution somewhere in the middle. Intelligent design argues that intelligence played a discernible role in the history of life. Whether that intelligence acted through an evolutionary process or by special creations is a separate question, and proponents of intelligent design come down on both sides of this question. (Behe, for instance, accepts common descent.)

DEFINING SIGNS OF INTELLIGENCE. The idea that an intrinsic intelligence or teleology inheres in and is expressed through nature has a long history and is embraced by many religious traditions. The main difficulty with this idea since Darwin's day, however, has been to discover a conceptually powerful formulation of design that can fruitfully advance science. What has kept design outside the scientific mainstream since the rise of Darwinism has been the lack of precise methods for distinguishing intelligently caused objects from unintelligently caused ones.

For design to be a fruitful scientific concept, scientists have to be sure they can reliably determine whether something is designed. Johannes Kepler, for instance, thought the craters on the moon were intelligently designed by moon dwellers. It is now known that the craters were formed by purely material factors (like meteor impacts). This fear of falsely attributing something to design only to have it overturned later has hindered design from entering the scientific mainstream. But design theorists argue that they now have formulated precise methods for discriminating designed from undesigned objects. These methods, they contend, enable them to avoid Kepler's mistake and reliably locate design in biological systems.

As a theory of biological origins and development, intelligent design's central claim is that only intelligent causes adequately explain the complex, information-rich structures of biology and that these causes are empirically detectable. To

say intelligent causes are empirically detectable is to say there exist well-defined methods that, based on observable features of the world, can reliably distinguish intelligent causes from undirected natural causes. Many special sciences have already developed such methods for drawing this distinction—notably forensic science, cryptography, archaeology, and the search for extraterrestrial intelligence (SETI). Essential to all these methods is the ability to eliminate chance and necessity.

The astronomer Carl Sagan wrote a novel about SETI called *Contact* (1985) that was later made into a movie. Sagan based the SETI astronomers' methods of design detection squarely on scientific practice. Why do the radio astronomers in *Contact* draw such a design inference from the signals they monitored from distant space? SETI researchers run signals collected from space through computers programmed to recognize preset patterns. These patterns serve as a sieve. Signals that do not match any of the patterns pass through the sieve and are classified as random.

After years of receiving apparently meaningless, random signals, the *Contact* researchers discover a pattern of beats and pauses that corresponds to the sequence of all the prime numbers between 2 and 101. (Prime numbers are divisible only by themselves and by one.) That startles the astronomers, and they immediately infer an intelligent cause. When a sequence begins with 2 beats and then a pause, 3 beats and then a pause, and continues through each prime number all the way to 101 beats, researchers must infer the presence of an extraterrestrial intelligence.

The rationale for this inference is that nothing in the laws of physics requires radio signals to take one form or another. The prime sequence is therefore contingent rather than necessary. Also the prime sequence is long and hence complex. Note that if the sequence were extremely short and therefore lacked complexity, it could easily have happened by chance. Finally, the sequence is not merely complex but also exhibits an independently given pattern or *specification* (it is not just any sequence of numbers but a mathematically significant one—the prime numbers).

Intelligence leaves behind a characteristic trademark or signature—what within the intelligent design community is now called *specified complexity*. An event exhibits specified complexity if it is contingent and therefore not necessary, if it is complex and therefore not readily reproducible by chance, and if it is specified in the sense of exhibiting an independently given pattern. Note that a merely improbable event is not sufficient to eliminate chance—by flipping a coin long enough, one will witness a highly complex or improbable event. Even so, one will have no reason to attribute it to anything other than chance.

The important thing about specifications is that they be objectively given and not arbitrarily imposed on events after the fact. For instance, if an archer fires arrows at a wall and then paints bull's-eyes around them, the archer imposes a

pattern after the fact. On the other hand, if the targets are set up in advance (specified) and then the archer hits them accurately, one legitimately concludes that it was by design.

The combination of complexity and specification convincingly points the radio astronomers in the movie *Contact* to an extraterrestrial intelligence. Note that the evidence is purely circumstantial—the radio astronomers know nothing about the aliens responsible for the signal or how they transmit it. Design theorists contend that specified complexity provides compelling circumstantial evidence for intelligence. Accordingly specified complexity is a reliable empirical marker of intelligence in the same way that fingerprints are a reliable empirical marker of an individual's presence. Moreover design theorists argue that purely material factors cannot adequately account for specified complexity.

BIOLOGICAL DESIGN. In determining whether biological organisms exhibit specified complexity, design theorists focus on identifiable systems (e.g., individual enzymes, metabolic pathways, and molecular machines). These systems are not only specified by their independent functional requirements but also exhibit a high degree of complexity.

In *Darwin's Black Box* (1996) the biochemist Michael Behe connects specified complexity to biological design through his concept of *irreducible complexity*. Behe defines a system as irreducibly complex if it consists of several interrelated parts for which removing even one part renders the system's basic function unrecoverable. For Behe, irreducible complexity is a sure indicator of design. One irreducibly complex biochemical system that Behe considers is the bacterial flagellum. The flagellum is an acid-powered rotary motor with a whiplike tail that spins at twenty thousand revolutions per minute and whose rotating motion enables a bacterium to navigate through its watery environment.

Behe shows that the intricate machinery in this molecular motor—including a rotor, a stator, O-rings, bushings, and a drive shaft—requires the coordinated interaction of approximately forty complex proteins and that the absence of any one of these proteins would result in the complete loss of motor function. Behe argues that the Darwinian mechanism faces grave obstacles in trying to account for such irreducibly complex systems. In *No Free Lunch* (2002) William Dembski shows how Behe's notion of irreducible complexity constitutes a particular instance of specified complexity.

Once an essential constituent of an organism exhibits specified complexity, any design attributable to that constituent carries over to the organism as a whole. To attribute design to an organism one need not demonstrate that every aspect of the organism was designed. Organisms, like all material objects, are products of history and thus subject to the buffeting of purely material factors. Automobiles, for instance, get old and exhibit the effects of corrosion, hail, and frictional forces. But that does not make them any less designed. Likewise design theorists argue that organisms, though exhibiting the effects of history (and that includes

Darwinian factors such as genetic mutations and natural selection), also include an ineliminable core that is designed.

INTELLIGENT DESIGN AND RELIGION. Intelligent design's main tie to religion is through the design argument, and perhaps the best-known design argument is William Paley's. Paley published his argument in 1802 in a book titled *Natural Theology*. The subtitle of that book is revealing: *Evidences of the Existence and Attributes of the Deity, Collected from the Appearances of Nature*. Paley's project was to examine features of the natural world (what he called "appearances of nature") and from there draw conclusions about the existence and attributes of a designing intelligence responsible for those features (whom Paley identified with the God of Christianity).

According to Paley, if one finds a watch in a field (and thus lacks all knowledge of how the watch arose), the adaptation of the watch's parts to telling time ensures that it is the product of an intelligence. So too, according to Paley, the marvelous adaptations of means to ends in organisms (like the intricacy of the human eye with its capacity for vision) ensure that organisms are the product of an intelligence. The theory of intelligent design updates Paley's watchmaker argument in light of contemporary information theory and molecular biology, purporting to bring this argument squarely within science.

In arguing for the design of natural systems, intelligent design is more modest than the design arguments of natural theology. For natural theologians like Paley, the validity of the design argument did not depend on the fruitfulness of design-theoretic ideas for science but on the metaphysical and theological mileage one could get out of design. A natural theologian might point to nature and say, "Clearly the designer of this ecosystem prized variety over neatness." A design theorist attempting to do actual design-theoretic research on that ecosystem might reply, "Although that is an intriguing theological possibility, as a design theorist I need to keep focused on the informational pathways capable of producing that variety."

In his *Critique of Pure Reason* (1781) Immanuel Kant claimed that the most the design argument can establish is "an architect of the world who is constrained by the adaptability of the material in which he works, not a *creator* of the world to whose idea everything is subject" (Kant, 1929, p. 522). Far from rejecting the design argument, Kant objected to overextending it. For Kant, the design argument legitimately establishes an architect (that is, an intelligent cause whose contrivances are constrained by the materials that make up the world), but it can never establish a creator who originates the very materials that the architect then fashions.

Intelligent design is entirely consonant with this observation by Kant. Creation is always about the source of being of the world. Intelligent design, as the science that studies signs of intelligence, is about arrangements of preexisting materials that point to a designing intelligence. Creation and

intelligent design are therefore quite different. One can have creation without intelligent design and intelligent design without creation. For instance, one can have a doctrine of creation in which God creates the world in such a way that nothing about the world points to design. The evolutionary biologist Richard Dawkins wrote a book titled *The Blind Watchmaker: Why the Evidence of Evolution Reveals a Universe without Design* (1996). Even if Dawkins is right about the universe revealing no evidence of design, it would not logically follow that it was not created. It is logically possible that God created a world that provides no evidence of design. On the other hand, it is logically possible that the world is full of signs of intelligence but was not created. This was the ancient Stoic view, in which the world was eternal and uncreated and yet a rational principle pervaded the world and produced marks of intelligence in it.

The implications of intelligent design for religious belief are profound. The rise of modern science led to a vigorous attack on all religions that treat purpose, intelligence, and wisdom as fundamental and irreducible features of reality. The high point of this attack came with Darwin's theory of evolution. The central claim of Darwin's theory is that an unguided material process (random variation and natural selection) could account for the emergence of all biological complexity and order. In other words, Darwin appeared to show that the design in biology (and by implication in nature generally) was dispensable. By showing that design is indispensable to the scientific understanding of the natural world, intelligent design is reinvigorating the design argument and at the same time overturning the widespread misconception that the only tenable form of religious belief is one that treats purpose, intelligence, and wisdom as by-products of unintelligent material processes.

WILLIAM A. DEMBSKI (2005)

INTERLACUSTRINE BANTU RELIGIONS.

The term *interlacustrine Bantu*, as used here, encompasses a variety of peoples who live between the Great Lakes of east-central Africa and speak closely related Bantu languages.

Their territory includes some of the most densely populated regions of Africa, consisting of all of Uganda south of the Victoria Nile, the states of Rwanda and Burundi, and a substantial portion of northwest Tanzania. Before independence, most of the area was divided into a number of traditional kingdoms, the largest of these being Rwanda and Burundi in the south and the four Uganda monarchies of Buganda, Bunyoro, Toro, and Ankole in the north. There were also about a dozen smaller but structurally similar units in the Tanzanian sector. The mass of the people are agriculturalists, but in many areas a cattle-owning minority, called Huma, or Hima, in the north and Tutsi in the south, formed a dominant and hereditary upper class.

Today most of the people of the region are at least nominally Christians; there is also a substantial minority of Muslims. But the indigenous cults are still widespread and are remarkably similar throughout the area.

THE SPIRIT POWERS. All the peoples of the area have the idea of a supreme being, known as Imana in the south, Ruhanga in the Nyoro-speaking north, and Katonda in Uganda; the last two names mean "creator." In some myths the hierarchical class structure mentioned above is ascribed to him, which to a certain degree may have sanctioned its acceptance by the less privileged. But, in a familiar pattern, the creator god, having made the world, was disappointed by it and withdrew from active participation in human affairs. Shrines are not made for him, nor are sacrifices offered as they are to the other gods (though here Buganda seems to have been an exception). In contrast to the lesser spirit powers, no mediumship cult is dedicated to the supreme being. He is, however, thought to be generally well disposed toward humans, and brief prayers and thanks may be offered up to him on a casual basis.

Far more significant in everyday life are the powerful spirits known as *embandwa* or *emandwa*. The most important of these form a group of hero-gods, whose names are well known throughout the area. They are linked in the south with a quasi-mythical ruler called Ryangombe and in the north with a shadowy ruling dynasty whose members are called *cwezi*. These heroic figures are the subject of a rich mythology; sometimes they are represented as the earliest descendants of the creator, sometimes as having come from a distant country. In either case they were great warriors, larger than life, and the doers of marvelous deeds. They were accompanied by retinues of kin and servants, and their women are included among their number. Like the Greek gods, some are identified with particular features of the environment; thus Wamara is associated with rain and rivers, Kagoro with thunder and lightning, Mulisa with cattle and cattle herding, Mugasa with the Great Lakes, and so on.

Eventually this heroic race vanished from the world: some say that the *cwezi* disappeared into one of the lakes in the area; Ryangombe is said to have been killed by a wild buffalo while hunting. But whatever their fate, it is believed that they left the institution of spirit mediumship behind for the

benefit of their successors. This institution involved both possession and mediumship; it is believed that the possessing spirit, while "in the head" of its medium, may enter into communication with the living within an accepted framework of values and beliefs. Traditionally, these cults focused especially on the hero-gods who were, and still are, regarded as primarily beneficial, concerned especially with human fecundity. In Bunyoro and some neighboring areas the *cwezi* are known as the "white" *embandwa*; the color white signifying purity and blessing. These traditional cults, centered on the *cwezi* in the north and on Ryangombe and his associates in the south, may be said to form the core of interlacustrine Bantu religions.

There are many other spirits of nonhuman and sometimes of foreign origin that can be approached through mediumship ritual. These are sometimes known in the northern areas as the "black" *embandwa*, and they include spirits associated with the bush, with certain illnesses, and with some neighboring countries. In the interlacustrine area (as elsewhere in Africa) more recent spirits have come to represent new and formidable forces of all kinds, such as hitherto unknown illnesses, manifestations of Western power such as motorcars, airplanes, and even army tanks, as well as such abstract qualities as "Europeanness." All these elements and a great many more have been readily incorporated into the mediumship cults.

In addition to the high god and the wide and growing variety of *embandwa* spirits, there are the ghosts of the dead. Ghost cults are not necessarily ancestor cults. An ancestor cult is concerned with the deceased forebears of a lineage, who are usually conceived as a collectivity and are believed to be directly interested in the well-being of their descendants. Though traces of such a cult are still found in parts of the interlacustrine area, it has none of the importance of such fully developed cults as have been described among, for example, some West African peoples.

But the cult of ghosts is important throughout the region. It is believed that ghosts are left by people after they die; diffused like the wind, such ghosts are sometimes associated with a shadowy underworld, and it is thought that they may bring death, illness, or other calamity on those who have injured or offended them while they were alive. Ghosts are not necessarily kin or affines of their victims, though very often they are. Disputes are especially likely to arise within a person's circle of relatives, and it is believed that these may readily take the form, postmortem, of ghostly vengeance. Anyone, relative or not, who dies with a grudge against another may "leave a ghost" to obtain revenge.

Throughout the interlacustrine area, ghosts are seen as malevolent rather than benevolent, more concerned to punish than to reward. They are feared rather than revered, though if they cannot be exorcised it is desirable to remain on good terms with them. In either case, recourse must be had to the possession cults.

CULTS. Generally people have recourse to the cults as a response to some misfortune, and when things go wrong, the first step is to consult a diviner. He, or possibly she, using one of a wide variety of techniques, is likely to ascribe the client's trouble to an *embandwa* spirit, an offended ghost, or sorcery. If the responsible agent is found to be an *embandwa* spirit or a ghost there are two possibilities. If the ghost is that of a stranger (or of a very distant relative) or if the affliction is attributed to a minor spirit such as might be sent by a sorcerer, then there are special ritual techniques for exorcising it and either destroying it or turning it away from its intended victim forever.

But the more important *embandwa*, and the ghosts of closely related kin or affines, cannot be dealt with so summarily. The afflicted person must become initiated into the mediumship cult as the spirit's human medium. This establishes an enduring relationship between person and spirit, a relationship that should be sustained from time to time by further possession ritual. In the course of these séances the possessing power is believed to be able to communicate with the living through its medium, who is supposed to be in a state of trance while this is happening. The spirit may begin by announcing its identity, and then greet and be greeted by all present. It may go on to explain what offended it and ask for food and drink—an offering that should be given to it there and then while it is “in the medium's head.” Or it may demand the sacrifice or dedication to it of a cow or a goat, or the building for it of a spirit hut. And it may, if it is the ghost of a close kinsman, ask for the reconciliation of quarreling family members. Before it “leaves the head” of its medium, a spirit, if it is mollified, is likely to bless all present and to promise them good fortune, and especially more children, in the future. Séances are dramatic occasions, involving drumming, dancing, and the singing of special songs, and mediums may assume the language and gestures appropriate to their possessing spirits.

While possessed, mediums appear to be in a state of trance and may claim afterward that they have no recollection of what happens to them when they are possessed. But evidence from several parts of the area indicates that complete dissociation is seldom, if ever, achieved; generally, the medium is “putting on an act.” But this does not mean that they are fraudulent; the play they are performing is a religious one, a “liturgical drama” in Luc de Heusch's phrase. And, in addition to providing a ritual means of influencing powers over which there are no other means of control, the mediumship cults are also a source of dramatic entertainment in their own right.

Admission to the cults requires a complex (and expensive) cycle of initiation ritual, often lasting for several days and culminating in the possession of the novice by the spirit concerned. The pattern of cult initiation is broadly similar throughout the area. First, the initiate's change of status is stressed. He, or more probably she, is reborn into a new family, that of her fellow mediums, and this rebirth may be sym-

bolically enacted. Second, the secrets of cult membership have to be learned; in particular, the novice may be told how to simulate possession and mediumship even though she does not actually achieve these states. Threats of the fearful consequences of disclosure confirm the candidate's commitment to secrecy. And third, the process of initiation puts the aspirant in a condition of ritual impurity, needing special ritual to remedy it.

SOCIAL CONTEXT. Important throughout much of the area was the role of the household medium, in the Nyoro-speaking region called *omucwezi w'eka* or, if female, *nyakata-gara*. One member of the family, usually female and preferably initiated while still a child, links the domestic group with one of the traditional *embandwa* spirits as its medium: this spirit is supposed to have a special concern for the well-being of the family members. Here especially the purity and auspiciousness of the traditional cults are stressed; for only a gentle and well-mannered child is acceptable to the spirits as a household medium. In some areas there is, in addition, a broader association between particular traditional spirits and particular clans, but generally this does not involve any special ritual over and above the “domestic” cults just mentioned.

The relationship between the *embandwa* cults and the traditional kingships was commonly one of implicit or explicit opposition. In several kingdoms, most notably those of Bunyoro and Rwanda, members of the royal clan (including the king himself) were debarred from participation in the mediumship cults. Kings in the interlacustrine region were not priests. Instead, they maintained priests at court—professional mediums who, like everyone else, were subject to the royal authority. Among the larger kingdoms it was only in Buganda, by far the most politically centralized of the interlacustrine states, that the royal line was closely identified with the mediumship cult. The official Ganda cult centered on the ghosts of former kings, whose tombs, carefully maintained, provided the locus for state ritual. But even here it was the *lubale* (i.e., *embandwa*) “priests,” and not the king, who were the mediums for the royal ancestors.

In the twentieth century the opposition between religion and state was exemplified in the rise and decline of the Nyabingi cult. This cult focused on a powerful female *embandwa* called Nyabingi and her associates, whose cult has been ascribed to various sources but may have originated in northern Rwanda, whence it spread rapidly into southwest Uganda. It appears to have begun as a reaction both against the traditional Ryangombe cults and against Rwanda's ruling class, the pastoral Tutsi. But with the coming of European colonial power, the cult became a protest movement against all governmental authority. In the 1920s a revolt by Nyabingi adherents against the local administration was crushed by military force, though the cult survived in attenuated form for many years.

It is not surprising that the *embandwa* cults found themselves in opposition to the Christian mission churches,

which, with only very limited justification, regarded them as being involved with witchcraft. Because the traditional cults were generally seen as beneficent and as being especially concerned with childbearing, attempts by government officials and missionaries to eradicate them were readily interpreted by the traditionally minded as aimed, in the long term, at the elimination of the indigenous peoples themselves. Mention should also be made here of the revivalist and fundamentalist Balokole (“the Saved Ones”) movement within the Anglican church. Although this movement affected only a small minority of Christians, its uncompromising evangelism brought it into conflict not only with the *embandwa* cults—with which it had certain things in common, for example, the notion of being “born again”—but also with the secular authorities.

How, finally, is one to explain the continued survival of the cults, old as well as new, throughout much of the area? Some of the reasons are implicit in what has been said above. But among the most important of them is the cults’ eclecticism. Inimical aspects of the environment, and in particular the disruptive effects of social change, are not denied or rejected; rather they are assimilated and dealt with through dramatic ritual. To give concrete expression to the forces that shape human lives (even if this is done in symbolic form) provides the interlacustrine Bantu with one basis for coping with these forces.

BIBLIOGRAPHY

Three works adopt a comparative approach. In his *Entre le Victoria l’Albert et l’Édouard: Ethnographie de la partie anglaise du Vicariat de l’Uganda* (Rennes, 1920), the missionary P. Julien Gorju gives a good account of the cults and of initiation into them in the Uganda kingdoms. Luc de Heusch’s *Le Rwanda et la civilisation interlacustre: Études d’anthropologie historique et structurale* (Brussels, 1966) contains a comprehensive analysis of the Ryangombe cult in Rwanda, taking account also of comparable data from neighboring areas. And Iris Berger’s *Religion and Resistance: East African Kingdoms in the Pre-colonial Period* (Tervuren, Belgium, 1981), although largely concerned with historical reconstruction, includes an up-to-date review and assessment of current information on the cults over the whole area as well as a useful bibliography. Berger notes in particular the important role played in the cults by women.

There are several brief accounts of the religious beliefs and rituals of particular peoples in the area; see, for example, Lucy P. Mair’s “Religion and Magic,” chapter 9 of her book on the Ganda, *An African People in the Twentieth Century* (1934; New York, 1965); J. J. Maquet’s “The Kingdom of Ruanda,” in *African Worlds*, edited by Daryll Forde (London, 1954); and John Beattie’s “Spirit Mediumship in Bunyoro,” in *Spirit Mediumship and Society in Africa*, edited by John Beattie and John Middleton (New York, 1969). A monograph by a Norwegian anthropologist, Svein Bjerke, *Religion and Misfortune: The Bacwezi Complex and the Other Spirit Cults of the*

Zinza of Northwestern Tanzania (Oslo, 1981), provides a detailed account, based on field research, of the cults among one of the less well known peoples of the region. Relevant to the study of religion in its political context is Elizabeth Hopkins’s “The Nyabingi Cult of Southwestern Uganda,” in *Protest and Power in Black Africa*, edited by Robert I. Rotberg and Ali A. Mazrui (Oxford, 1970), a history of the rise and influence of an anticolonial spirit cult. Finally, for an African academic’s view of his own traditional religion, see Abel G. M. Ishumi’s “Religion and the Cults,” chapter 6 of his *Kiziba: The Cultural Heritage of an Old African Kingdom* (Syracuse, N.Y., 1980)

JOHN BEATTIE (1987)

INTERMEDIATE BEINGS SEE ANGELS; DEMONS; DEVILS; FAIRIES; GHOSTS; MONSTERS

INTERNATIONAL SOCIETY FOR KRISHNA CONSCIOUSNESS (ISKCON) is the missionary form of devotional Hinduism brought to the United States in 1965 by a pious devotee of Kṛṣṇa who wanted to convert the English-speaking world to “God-consciousness.” By 2003, ISKCON had become an international movement with more than 350 temples and centers worldwide (approximately fifty in the United States).

ESTABLISHED AS CHARISMATIC MOVEMENT. The founding guru of ISKCON, A. C. Bhaktivedanta Swami Prabhupada, was born Abhay Charan De in 1896 in Calcutta. Educated in a Vaiṣṇava school and later in Scottish Church College, he was a sporadically successful businessman in the pharmaceutical industry. However, after he was initiated in 1922 by Bhaktisiddhanta Sarasvati, a Gauḍīya (Bengali) Vaiṣṇava, in the line of the sixteenth-century saint and reformer Caitanya, he began increasingly to invest time and money in his religious interests. In 1944 Prabhupada established the magazine *Back to Godhead*, and in 1952 he formed the Jhansi League of Devotees. He gave up his life as a householder (*grihastha*) in 1954 and took the formal vows of an ascetic (*sannyāsīn*) in 1959.

In September 1965, at the age of sixty-nine, Prabhupada arrived in New York City with less than ten dollars in his pocket and a suitcase full of his translations of the Kṛṣṇa scripture, called the *Śrīmad Bhāgavatam*. He lived with various Indian and American supporters in Manhattan, where he daily chanted and sang the praises of Kṛṣṇa. Prabhupada’s lectures and devotional services initially attracted many counterculture youths, and preaching centers were established in Los Angeles, Berkeley, Boston, and Montreal. By the early 1970s, Los Angeles had become the headquarters of ISKCON and its publishing office, the Bhaktivedanta Book Trust, which has printed more than fifty different translations and original works by Prabhupada and hundreds of other ISKCON treatises since his death.

From the earliest years of the movement, Prabhupada's disciples have been known for their public chanting (*saṅkīrtan*) of the Hare Kṛṣṇa mantra and their distribution of *Back to Godhead* magazine and Prabhupada's books. Like his Indian godbrothers, Prabhupada believed that the recitation of God's name was necessary for salvation. Further, his guru had instructed him to bring "Krishna consciousness" to the English-speaking world. Consequently, the "Hare Krishnas" have been both very visible and evangelical in India, America, and globally.

In July 1970, Prabhupada formed a Governing Body Commission (GBC) of twelve advanced devotees to administer an increasingly widespread and complex ISKCON and to allow him to spend his time preaching and translating. At this same time, he instituted a series of standardized religious practices that made ISKCON devotees more like their Indian counterparts. Male devotees who entered the temple had to wear the traditional saffron dress of the monastic novice and shave their heads, while women wore traditional Indian saris. All temples were to follow a daily regimen of rising at 4:00 AM for morning devotional services (*pūjā*), chanting sixteen rounds of the Kṛṣṇa mantra on 108 prayer beads (*jāpā*), and attending a lecture on a scriptural passage. A clear distinction was made between *brahmācarin*, or "student," devotees who intended to take the four monastic regulative principles (no meat eating, no intoxicants of any kind, no sexual activity of any kind, and no gambling) and *grihastā*, or "householder," devotees who intended to live in marriage (often outside the temple) and who might also take a modified version of the four vows.

EXPANSION AND EXTERNAL OPPOSITION. Throughout the 1970s and early 1980s, ISKCON became more conscious of its Indian roots at the same time that it was expanding to every continent on the globe. Prabhupada frequently returned to India from 1970 until his death in Vṛndāvana, India, in November 1977. He received a hearty welcome from most Indians, who jokingly called his devotees "dancing white elephants." He established temples and preaching centers near Bombay, in Vṛndāvana (the birthplace of Kṛṣṇa), and in Māyāpur (the birthplace of Caitanya). By the early 1980s, the Bombay temple had more than six thousand Indian "lifetime" congregational members, and the Vṛndāvana temple was included on most Kṛṣṇa pilgrims' circuits. Back in America, Indian immigrants became members of ISKCON temples and were often strong supporters of this transplanted devotional Hindu movement.

Prabhupada circled the globe eleven times in his twelve years of missionary activity and established temples in England and continental Europe as well as in India, Australia, and South Africa. Just before his death, he appointed eleven disciples as initiating gurus to keep his Caitanya chain of discipleship unbroken and to missionize the rest of the world. By the mid-1980s his disciples had established forty-five temples or farms in Europe, ten in Africa, thirty-five in Asia, and forty in South America. Whereas the full-time member-

ship of the American temples remained constant or declined in the decade after Prabhupada's death, ISKCON branches grew rapidly overseas, where they often found more welcoming environments.

During the 1990s, ISKCON's primary growth came in the former Soviet states with twenty temples formed in Russia alone. In April 1998, ISKCON's status as an accepted Hindu tradition was confirmed as the prime minister helped inaugurate a new temple and museum complex in New Delhi, India.

Throughout its history in America, ISKCON has encountered opposition from anticult groups such as the Citizens' Freedom Foundation, the Cult Awareness Network, and the American Family Foundation. The movement's methods of book distribution and fund-raising have most often been at the heart of both external and internal criticism. These questionable practices were often the result of the unbounded enthusiasm of devotees and organizational inconsistencies during the first two decades of ISKCON's development. The early decades of this charismatic movement also spawned several internal crises that fully emerged after the founder's death.

INTERNAL CRISES. Existing leadership problems were heightened after the founder's death. ISKCON began as a charismatic movement founded on the strength of Prabhupada's pious faith and practices. While the administrative and religious authority of the founder could be transferred to his eleven appointed successors, his piety and depth of faith could not. The initial practice was for the eleven guru successors to provide spiritual and administrative leadership for a geographical "zone" and to act as though they were Prabhupada (i.e., they initiated disciples, accepted guru worship, and so on). Some of the new ISKCON gurus even claimed that their individual authority was superior to that of the GBC. But one by one, many of these young gurus succumbed to the temptations of sex or the abuse of their power. By the late 1980s, six of the original eleven had either voluntarily stepped down or had been removed by the GBC. By the mid-1980s the GBC authorized the inauguration of nearly two dozen new initiating gurus and assigned more than one guru to each geographical zone where devotees lived. Throughout the 1990s the guru and leadership debates continued with many Kṛṣṇa devotees (including some gurus) defecting to start their own movement or to become the disciple of one of the Indian godbrothers of Prabhupada. Several waves of reform during the 1980s and 1990s altered the power and scope of individual gurus. In 2003 the supreme court in India was asked to adjudicate leadership squabbles among temple leaders who quarreled over the powers of current ISKCON gurus in India. In the absence of the founding guru, the GBC and the appointed gurus together have tried to provide leadership for the worldwide movement in the face of economic and legal crises that have threatened the movement's very survival.

A second serious internal crisis for ISKCON has been the abuse of children. In the early 1970s the number of married devotees was rising, and some of the initial devotees accepted the life of the “renounced” *sannyāsīn*. This shift of authority in the Kṛṣṇa temples to the celibate devotees created a lower social status for families (and especially women and children) than had been true in the 1960s. Schools for children called *gurukulas* (guru schools) were established in Dallas and Los Angeles in America and in Vrindaban, India. The schools were often run by *sannyāsīns* who had no experience in child rearing, and initially parents were strongly discouraged from maintaining contact with their children. In 1974, stories of child abuse (e.g., harsh punishments and psychological deprivations) arose surrounding the Dallas *gurukula*. Less than a year later the school was closed, and school reforms were put in place. Yet throughout the 1970s into the early 1980s, abuses ranging from overzealous corporal punishment and food deprivation to sexual abuse occurred in some *gurukulas* with some children.

In 1990 the GBC established policies requiring abuse-prevention training and mandatory reporting of abuse allegations in Kṛṣṇa schools. In 1996, ten former *gurukula* students spoke at an annual North American GBC meeting about their abuse. As a result, the Children of Krishna organization was formed to provide counseling and educational resources for Kṛṣṇa youth. In 1997 a professionally staffed Child Protection Office was formed to investigate and adjudicate child abuse allegations. However, in June 2000, a \$400 million lawsuit was filed on behalf of former *gurukula* students against two dozen Kṛṣṇa temples. The case was dismissed from federal court in 2002 but refiled on behalf of ninety-one former students in the Texas State Court. In 2003 the ISKCON temples named in the suit sought Chapter 11 bankruptcy protection. All of the boarding *gurukulas* in the United States had closed their doors by the mid-1990s, but Kṛṣṇa day schools continue to educate many devotee children.

The third persistent internal issue of considerable magnitude concerns the role and status of women in ISKCON. Since the Middle Ages in India, Vaiṣṇava and other devotional traditions have afforded women greater spiritual status than traditional Vedic beliefs and practices had. However, it is still often assumed in India that a woman’s material body requires her to be “protected” by her father in her youth, her husband in her middle years, and her sons in her old age. When Prabhupada first came to America, he treated women and men devotees with considerable equality. Women were permitted to lead worship services, to give lectures on the Kṛṣṇa scriptures, and even to hold offices in temples. He argued that spiritually there was no difference between men and women, which was a more liberal view than most of his Indian godbrothers. But with the ascendancy of the *sannyāsīn*, or “renounced,” movement in the early 1970s, women found themselves to be second-class devotees in ISKCON. From the mid-1970s through the mid-1990s, women

devotees in most temples were forbidden to lead chanting, to give *Bhāgavatam* class, or to hold high offices in a temple or the GBC.

In the late 1980s and early 1990s, some women and men came forward to insist on the equal spiritual, social, political status that women had enjoyed earlier under Prabhupada. In the mid-1990s some temple leaders in Europe and the United States said that discrimination against women must cease and permitted women to engage in religious and leadership roles equal to men. In 1996 an American woman devotee was appointed to the GBC, which had previously been open only to men (i.e., gurus and laymen). This act signaled that women could be equal to men as “advanced devotees” and policymakers for ISKCON—even though men alone can be gurus. In 1997 ISKCON held its first conference for Women’s Ministry and explored the pent-up issues that previously had been taboo. In 1998 a second woman was added to the international GBC, and in 2000, at the International GBC meeting in Mayapur, India, a resolution was passed that provided for the “equal facility, full encouragement, and genuine care and protection of women members of ISKCON.” By 2000, several temples in Europe and the United States were led by women presidents. However, the role of women in ISKCON still depends to a considerable degree on whether they live in or outside India, and on whether the local temple practices derive from the notions of the equality of spirit or they insist on the differentness of gender. The role of women in ISKCON will always be lodged in the context of a Hindu and Indian view of women that will make full equality difficult to achieve. And yet ISKCON is constantly molded by global processes of institutionalization and accommodation that include pressure to give women a greater voice.

INSTITUTIONALIZATION AND MATURATION. ISKCON is truly an international religious movement and, as such, is very diverse, depending on whether the locus is the Los Angeles temple, the Bhaktivedanta Manor in London, or the pilgrimage center in Māyāpur, India. Yet there are certain common trends toward the “Hinduization” of ISKCON that bring it into the sphere of other Vaiṣṇava traditions in India and have attracted many Indian members to its temples throughout the world. Likewise, there are trends toward institutional maturation in ISKCON that are revealed in an academic seriousness that has led more than a dozen leading devotees to earn Ph.D.s in the 1990s and the creation of several academic journals. ISKCON has created leadership classes for temple officials that range from economic and managerial lessons to instructions on the proper place and treatment of children and women in the movement. ISKCON has initiated interfaith conversations such as the “Vaishava-Christian Dialogue” and has established a European ministerial college in England. To be sure, its “Indianness” (e.g., circular concept of time, or *samsāra*) and “Hinduness” (e.g., its focus on Kṛṣṇa rituals and scriptures) will always make ISKCON a minority religious tradition outside of India. Still, its capacity to accommodate its beliefs and prac-

tices globally according to the medieval Vaiṣṇava dictum of “time, place and circumstance” should serve it well into the future as it seeks an enduring place in the religious landscape of a twenty-first-century multicultural world.

J. Stillson Judah's study of California devotees, *Hare Krishna and the Counterculture* (New York, 1974), is now dated, but its emphasis on ISKCON's origin as a religious alternative to and embodiment of countercultural values and attitudes is still instructive. An anthropological study that focuses on the Boston, New York, London, and Amsterdam temples is Francine Jeanne Daner's *The American Children of Krishna* (New York, 1976). Daner also places the rise of ISKCON in the context of “counterculture religions” as well as in the framework of Erik Erikson's identity theory of personality development. Larry D. Shinn's *The Dark Lord: Cult Images and the Hare Krishnas in America* (Philadelphia, 1987) is based on more than one hundred interviews of Krishna devotees conducted over two years in fourteen temples throughout America and India and presents the various aspects of the American Krishna faith in the framework of anticult criticisms and a history of religions perspective on this devotional Indian faith. For a good summary of the child abuse issue, see E. Burke Rochford. “Child Abuse in the Hare Krishna Movement: 1971–1986,” *ISKCON Communications Journal* 6 (1998): 43–69. For a reflective essay concerning the role and status of women in ISKCON see Kim Knott, “Healing the Heart of ISKCON: The Place of Women,” in *The Hare Krishna Movement: The Post-Charismatic Fate of a Religious Transplant*, edited by Edwin F. Bryant and Maria L. Ekstrand (New York, 2004). The Bryant and Ekstrand book is remarkable in the scope and coherence of its essays and for its inclusion of insiders' and outsiders' perspectives. For an insider's report on the way that ISKCON has responded to many of its growth pains and crises in the 1970s and 1980s, see Nori J. Muster, *Betrayal of the Spirit* (Chicago, 2001). For a good example of the institutionalization and “Hinduization” of ISKCON, see Malory Nye, *Multiculturalism and Minority Religions in Britain: Krishna Consciousness, Religious Freedom, and the Politics of Location* (Richmond, U.K., 2001).

LARRY D. SHINN (1987 AND 2005)

INTI was the Inca sun god, worshiped in the Andes at the time of the Spanish conquest in the first half of the sixteenth century. The Sun was the Inca's dynastic ancestor and imperial god. The Inca ruler was believed to be the son of the Sun; his commands were divine oracles. According to one variant of the Inca creation myth, the Sun, having been created by the god Viracocha on a sacred island in Lake Titicaca (on the Bolivian-Peruvian Altiplano), rose over the lake and spoke to the first Inca ruler, Manco Capac, to whom he gave in-

struction in Sun worship. The Sun was the most important sky god, with Thunder (or Weather), Moon, and the star deities trailing in rank. There may have been a tripartite division of the Sun, but this is not clear. As was often true in New World religions, the Sun had various aspects or names. Inti was the royal deity; he was also identified with Punchao, the Sun of the day—that is, daylight. There may also have been specifically identified Suns of solstices or other astronomical events.

Inca sun worship was intimately integrated with the growing of maize. The sun was of vital importance in an expanding agricultural society mostly situated in hail-ridden altitudes with frequent frosts. The sun also regulated planting times. In the Inti Raymi (“sun festival”), held at the winter solstice (June), priests made a pilgrimage toward the east, and a ceremony took place in which the Inca ruler lifted a cup of *chicha* (a fermented maize drink) to the Sun, then sprinkled the liquid on the ground. There were sacrifices to the Sun on neighboring hills.

The legend of the founding of Cuzco, the capital city, indicates the agricultural basis of Inca religion. The wandering Inca, led by Manco Capac, were told to establish the city in a place where a gold rod given to them by the Sun would sink into the earth with one blow, indicating good planting ground. The Coricancha (“golden enclosure”), begun by Manco Capac as a humble shrine on the spot where the rod sank, was later expanded into the Temple of the Sun, an impressive structure of finely worked stone buildings around a courtyard; the facade was decorated with sheets of gold that reflected sunlight. (Manco Capac had originally presented himself to the Cuzco Valley people dressed in sun-catching gold ornaments.)

The Coricancha was the primary religious center, a place of pilgrimage, and a model for other Sun temples throughout the vast Inca empire. The priests of the Sun were of the highest rank (the chief priest was a relative of the Inca ruler), and there were many of them. At the Coricancha lived the “chosen women,” wives of the Sun, who performed ritual duties including the preparation of ceremonial maize and *chicha* and the weaving of fine cloth to be offered to the Sun. At Inti Raymi, maize was specially prepared by them because it was thought to be a gift from the Sun. During several festivals only maize could be eaten. It was grown in the garden of the Coricancha, and three times a year, during festivals, maize plants fashioned of gold were displayed there. The best lands and largest herds of llamas belonged to the Sun, who also received the finest offerings, including pure-white llamas and objects of gold.

INTOXICANTS SEE BEVERAGES; PSYCHEDELIC DRUGS

INTUITION. The term comes from the Latin *intuitio*, which is derived from *intueri*, meaning to look at attentively (with astonishment or admiration), gaze at, contemplate, or pay attention to. At first confined to direct visual experience, the term came to denote the process of insight as well as its object. Intuition in this first sense is a direct “look” at a particular thing that shows itself immediately in its concrete fullness without the mediation of any other knowledge, procedure, or content. The roots of this meaning lie in the visual character of the Greek, Arabic, and Hebrew mentalities as reflected in the Platonic-Augustinian tradition. In the later and wider sense, the word designates the direct apprehension of an object in its present, concrete reality through either sense perception (including memory and imagination) or the intellect. *Intuition* is today almost exclusively understood in a metaphorical sense; the word designates the human capacity for instant and immediate understanding of an object, a person, a situation, and so forth. The immediacy of intuition sets it in opposition to the discursive function of the intellect, which is mediated by concepts and propositions. In this sense, intuition entails the direct, nonmediated presence of the object to the knowing faculty; it sometimes extends to a partial or total fusion of subject and object. Knowledge of this kind excludes all rational, gnoseological, or even psychological analysis or justification.

The many, sometimes divergent, uses of the word can be classified into several distinct types: (1) sensory (aesthetic) or empirical intuition is a nonconceptual, nonrational grasp of reality; (2) intellectual, logical, or mathematical intuition is the self-evident grasp of fundamental ideas, axioms, principles, or truths; (3) essential intuition is a grasp of the inner essence of a thing, a being, a cause, a situation; and (4) spiritual intuition is the immediate contemplation of the highest order of things, an insight gained neither through the senses nor through intellectual reflection, but stemming from the “inner man” and akin to the receiving of a revelation.

THE PHILOSOPHICAL TRADITION. In Plato’s works, especially the dialogue *Phaedrus*, with its myth of the soul that contemplates the heavenly ideas before its embodiment, intuition is of these eternal essences, which are visible only to the intellect. In Plotinus, for whom the *nous* is able to apprehend the true world in itself, and the Neoplatonic mystics, the role of intuition in the spiritual sense looms large. Aristotle recognized the existence of intuitive knowledge (*Posterior Analytics* 1.9.76a21) in relation to the first principles, which are not in need of any demonstration. Augustine of Hippo, who be-

lieved that “the truth lies in the inner man,” considered intuition a form of mental contemplation. Thomas Aquinas attributed to God the veritable creative intuition; he defined human intuitive cognition as “the presence, in some way, of the intelligible to the intellect” (*Commentaries on the Sentences* 1d3.94a5). The medieval scholastics used “intuitive cognition,” as opposed to “abstractive cognition,” to designate knowledge in which the object is delivered directly to the senses. For Descartes, intuition constitutes each successive link in a chain of deductions that are noninferential concepts of the “pure and attentive mind.” For Spinoza, it is the third and highest degree of cognition. Kant recognized only sensible intuition. The German Idealists (Schelling, Fichte, Schopenhauer) and Husserlian phenomenologists viewed intellectual intuition as a deep and instantaneous understanding of things, essences, and situations given in perception. For Henri Bergson, intuition signifies an immediate awareness akin to instinct and sympathy, capable of penetrating its object while unfolding in the unique, qualitative time (“duration”) of each living being. Bergson opposed intuition to intelligence, the proper dimensions of which are geometrical space and mechanical clock-time; for him, intuition alone is capable of grasping the dynamic nature of things in its original simplicity.

RELIGIOUS INTUITION. In religion, the term *intuition* functions on several levels; the specific meanings are mostly variants of the spiritual intuition defined previously. The following aspects of religious intuition may be distinguished: (1) the understanding of divine commands; (2) the perception of the divine in religious or numinous experience, in the sense of a peering into the mysterious elusive presence of the transcendent in ways simultaneously sensory (seeing, hearing, or “smelling” divinity), intellectual, and suprasensory; (3) the illuminating understanding of the meanings hidden in metaphors and other literary tropes of sacred writings; and (4) the means of communicating and communion among believers.

All forms of mysticism and Gnosticism rely on intuition in the formulation of cognitive claims regarding the ineffable understanding of religious mysteries. The highest states of mystical contemplation may be conceived as uninterrupted chains of intuitive acts. The experience of nonduality in Advaita Vedānta, for example, is based on the insight of oneness and the disappearance of the distance between subject and object. “Suchness” (*tathatā*) in Mādhyamika Buddhism may be called an intuition of the ultimate as the invisible reality underlying all things. The Buddha’s enlightenment constitutes an intuitive peak—the highest form of mystical contemplation. Zen Buddhism, with its abhorrence for the discursive intellect, emphasizes *satori* as the immediate grasp of the Buddha nature. The crux of Zen meditational disciplines, whether of gradual enlightenment (in the “*zazen* only” Sōtō school) or of sudden enlightenment (the *kōan*-solving Rinzai school), lies in the all-pervading illumination of the mind, an insight that reaches into that which is beyond any subjectivity or objectivity.

In Jewish mysticism, the secret contents of the Qabalah are considered highly intuitive, obtained by a form of supernatural illumination. The poverty of ordinary human faculties does not allow proper cognition; intuition alone, tantamount in its "fine points" to divine inspiration, can create a felicitous "science of God" that reasoning is incapable of encompassing. Hence the claim, characteristic of Jewish mysticism, that true tradition and true intuition coincide, a tenet that plays an important part in the history of Qabalah, that of maintaining the balance between tradition and innovation.

In Islam, intuition plays a role in connection with *al-'aql*, a cognitive faculty often mentioned in the Qur'an that binds humankind to God (the root 'ql means literally "to bind"). Religious knowledge is participatory knowledge, higher than rational yet not opposed to the intellect. Direct vision by a "third eye," as opposed to the indirect knowledge yielded by intellectual ratiocination, is emphasized. In Islamic theology and philosophy, but especially in Šūfī mysticism, where the heart is traditionally considered the locus of intelligence and spirituality, the actually intuitive "knowledge of the heart" is connected with the creative imagination of the perfected universal man; such knowledge alone counts before the divine and is essential for salvation. In the esoteric tradition, some commentators of the Qur'an considered the intuitive faculty a gift of revelation by the Holy Spirit (the archangel Gabriel), an illumination received by the intellect.

In Daoism, the doctrine of "no knowledge" or "ignorance" is aimed at obtaining true wisdom or intuition. Creativity is unconscious of accumulated technical knowledge, but it relies on the certainty and precision of intuitive knowledge.

Revised Bibliography

INUIT RELIGIOUS TRADITIONS. The Inuit (Eskimo) live in the vast Arctic and sub-Arctic area that stretches from the eastern point of Siberia to eastern Greenland. Of the approximately 105,000 Inuit, 43,000 live in Greenland, 25,000 in Arctic Canada, 35,000 (plus 2,000 Aleut) in Alaska, and 1,500 (plus a small number of Aleut) in Russia. Language has been used as the basic criterion for defining the Inuit as an ethnic group. The "Eskimo languages" (as they are invariably referred to) are divided into two main branches, Inuit and Yupik. Inuit is spoken from northern Alaska to eastern Greenland, forming a continuum of dialects with mutual comprehension between adjacent dialects. Varieties of Yupik are spoken in Siberia and in southern Alaska as far north as Norton Sound.

The word *Eskimo* seems to be of Montagnais origin and has been erroneously believed to mean "eater of raw meat." The word *Inuit* means "people." *Inuit* as a self-designation is used primarily in Canada and, to some extent, in Greenland (where the more common self-designation is *Kalaallit*). *Yupik* means "a real person," just as *Inupiat*, which is the self-designation in northern Alaska, means "real people." *Inuit*, however, is the common term used to designate themselves collectively by the members of the Inuit Circumpolar Conference, an organization established in 1977 by representatives from Greenland, Canada, and Alaska.

Traditionally the Inuit are divided into many geographic groups. The members of each group, or band, were connected through kinship ties, but the band was without formal leadership. The nuclear family was the most important social unit, but the extended family often cohabited and worked cooperatively. Dyadic relationships, such as wife-exchange partners and joking partners, were also common.

Today, most Inuit live in the so-called Arctic area, north of the treeline and the 10° celsius July isotherm. The Inuit

were hunters who adapted to the seasonal availability of various mammals, birds, and fish. Hunting sea mammals with harpoons was characteristic, but hunting inland during the summer was also part of the subsistence pattern of many Inuit. A few groups in northern Alaska and in Canada have spent the entire year inland, hunting caribou and fishing for arctic char. In southern Alaska, the wooded valleys along the long rivers were inhabited by Inuit who relied upon the great run of the fish as well as the migrations of sea mammals and birds.

Most Inuit in Canada lived in snow houses during the winter; others settled in winter houses built of stone and sod or wood. Stone lamps that burned blubber were used for heating, lighting, and cooking. Skin boats and, except in southern Greenland and Alaska, dog sledges were used for transportation; kayaks were used for seal hunting and large, open umiaks for whale hunting. Although some Inuit are still hunters and fishermen, today's Inuit societies are modernized. Money economy has replaced subsistence economy; modern technology and education have been introduced; television plays an important role; and so on. Except for the small population in Siberia, the Inuit have become Christians, and even the Inuit in Siberia no longer observe their religious traditions.

Historically, the Inuit held many observances to insure good hunting, and in the small and scattered hunting and fishing communities many local religious practices were observed. Generally, ritual life was more elaborate in Alaska than in Canada and Greenland. In Alaskan settlements there were usually one or more big men's houses, called *qarigi* among the Point Barrow Inuit and *qasiq* among those of the Bering Sea, where people gathered for social and religious feasts. In Canada, the Inuit built temporary festival snow houses, but no eyewitness accounts exist of festival houses in Greenland.

RELATIONS BETWEEN MEN AND ANIMALS. According to eastern Inuit religious tradition, each animal had its own *inua* (its "man," "owner," or "spirit") and also its own "soul." Within the western Inuit religious tradition, the *inua* seems to have been identical to the soul. The idea of *inua* was applied to animals and implements as well as to concepts and conditions (such as sleep). Lakes, currents, mountains, and stars all had their own *inua*, but only the *inua* of the moon, air, and sea were integral to the religious life of the Inuit.

Since the Inuit believed that the animals they hunted possessed souls, they treated their game with respect. Seals and whales were commonly offered a drink of fresh water after they had been dragged ashore. Having received such a pleasant welcome as guests in the human world, their souls, according to Inuit belief, would return to the sea and soon become ready to be caught again, and they would also let their fellow animals know that they should not object to being caught. When the season's first kill of an important species of seal was made, the meat was distributed to all of the inhabitants of a settlement. This practice divided the re-

sponsibility for the kill among the entire community and increased the possibility of good hunting.

Inuit rituals in connection with the polar bear are part of an ancient bear ceremonialism of the circumpolar regions of Eurasia and North America. In southern Greenland, for example, the head of a slain polar bear was placed in a house facing the direction from which the bears usually came so that the bear's soul could easily find its way home. During the five days that the soul was believed to require to reach its destination the bear was honored: its eyes and nostrils were closed so that it would not be disturbed by the sight and smell of human beings; its mouth was smeared with blubber; and it was given presents.

Whaling was of great social, economic, and ritual importance, especially among the North Alaska Inuit. In the spring, all hunting gear was carefully cleaned, and the women made new clothes for the men. The whales would not be approached until everything was cleaned. During the days before the whaling party set out, the men slept in the festival house and observed sexual and food taboos. The whaling season terminated with a great feast to entertain the whales.

TABOOS, AMULETS, AND SONGS. Unlike cultic practices in connection with the deities, which had relatively minor significance, taboos, amulets, and songs were fundamentally important to the Inuit. Most taboos were imposed to separate the game from a person who was tabooed because of birth, menstruation, or death. A separation between land and sea animals was also important in many localities, reflecting the seasonal changes in hunting adaptation. An infringement of a taboo might result in individual hardship (for example, the loss of good fortune in hunting, sickness, or even death), but often, it was feared, the whole community would suffer. Usually a public confession under the guidance of the shaman was believed sufficient to reduce the effect of the transgression of a taboo.

Amulets, which dispensed their powers only to the first owner, were used primarily to secure success in hunting and good health and, to a lesser degree, to ward off negative influences. Parents and grandparents would usually buy amulets for children from a shaman. Amulets were usually made up of parts of animals and birds, but a wide variety of objects could be used. They were sewn on clothing or placed in boats and houses.

One way to increase the effect of the amulets was through the use of food totems and secret songs. Used primarily to increase success in hunting, secret songs and formulas were also used to control other activities and were often associated with food taboos. Songs were either inherited or bought. If a song was passed on from one generation to the next, all members of the family were free to use it, but once it was sold it became useless to its former owners.

rites of passage. In many localities in Canada and Alaska, women had to give birth alone, isolated in a small hut or

tent. For a specified period after the birth, the woman was subjected to food and work taboos. Children were usually named after a person who had recently died. The name was regarded as a vital part of the individual, and, in a way, the deceased lived on in the child. The relationship resulted in a close social bond between the relatives of the deceased and the child.

The family celebrated particular stages in a child's development, especially in connection with subsistence activities. For example, when a boy killed his first seal, the meat was distributed to all the inhabitants of the settlement, and for each new important species a hunter killed, there was a celebration and ritual distribution.

Death was considered to be a passage to a new existence. There were two lands of the dead: one in the sky and one in the sea (or underground). The Inuit in Greenland considered the land in the sea more attractive because people living there enjoyed perpetual success in whale hunting; those in the sky, on the other hand, led dull existences. It was not the moral behavior of the deceased that determined the location of his afterlife, but rather the way in which he died. For example, men who died while whaling or women who died in childbirth were assured of an afterlife in the sea. Conceptions of the afterlife, however, differed among the Inuit. The Canadian and Alaskan Inuit believed the most attractive afterlife was found in the sky. Some Inuit had either poorly conceptualized beliefs in an afterlife or no beliefs at all.

While death rituals usually included only the nearest family members and neighbors, the Great Feast of the Dead, celebrated in the Alaskan mainland from the Kuskokwim River to the Kotzebue Sound, attracted participants even from neighboring villages. The feast was given jointly, and the hosts' social status was demonstrated by the quantity of food, furs, clothing, and implements that were given away.

The Bladder Feast, an important calendar feast celebrated in Alaska from Kodiak Island to Point Hope, was held in midwinter. At this feast, the bladders of all the seals that had been caught during the previous year were returned to the sea in order that their souls might come back in new bodies and let themselves be caught again. The skins of all the small birds and animals that the boys had caught were displayed in the festival house, and gifts were given to human souls, to the souls of the seals, and to those who were present.

SHAMANS. In Greenland and Canada, the shaman (*angakkoq*) played a central role in religion. In Alaska, however, where it was common for an individual to become a shaman as the result of a calling, many rites did not demand the expertise of the shaman. Prospective shamans often learned from skilled shamans how to acquire spirits and to use techniques such as ecstatic trances. In Greenland and Labrador, the apprentice was initiated by being "devoured" by a polar bear or a big dog while being in trance alone in the wilderness. After having revived, he was ready to become master of various spirits.

Shamans in Greenland always used a drum to enter a trance. Masks were also instrumental, especially in Alaska, both in secular and religious connections. The shaman might summon his familiar spirits to the house where a séance was taking place, or he might go on a spiritual flight himself. The Canadian shaman might, for example, go down to the *inua* of the sea, that is, the Sea Woman, to get seals. In Alaska, a shaman on Nunivak Island would go to the villages of the various species of animals in the sea. In the Norton Sound area he would go to the moon to obtain animals for the settlement.

Although shamans were the principal revealers of unknown things, some other people could also acquire information from the spirits by using a simple technique called *qilaneq*. It required that an individual lift an object and then pose questions, which were answered affirmatively or negatively according to whether the object felt heavy or not.

Shamans also functioned as doctors. For example, they would suck the sick spot where a foreign object had been introduced or try to retrieve a stolen soul. Sorcerers—often believed to be old, revengeful women—were also common, and shamans were sometimes called to reveal them. There were instances, however, in which the shaman himself was accused of having used his power to harm someone; in such cases the shaman could be killed.

THE DEITIES. The Inuit of Canada and Greenland believed that the *inua* of the sea, the Sea Woman, controlled the sea animals and would withhold them to punish people when they had broken a taboo. Franz Boas (1888) transcribed the name given to her by the Inuit on Baffin Island as *Sedna*, which probably means "the one down there."

The Inuit of eastern Baffin Island ritually killed Sedna during a feast that was held when the autumn storms came and whose purpose was to make sealing possible again. The Sedna ceremony included, *inter alia*, a ritual spouse exchange and a tug-of-war, the result of which predicted the weather for the coming winter.

While Sedna represented the female principle of the world, the *inua* of the moon, Aningaaq, represented the male principle. An origin myth tells how he was once a man who committed incest with his sister. She became the sun, he the moon. Otherwise the sun played no part in the religion of the Inuit, but the moon was associated with the fertility of women. He was recognized as a great hunter, and some Alaskan Inuit believed that the moon controlled the game.

The air was called Sila, which also means "universe" and "intellect." The *inua* of the air was a rather abstract but feared figure; if it was offended when taboos were broken, it would take revenge by bringing storms and blizzards.

The Raven appeared, primarily in Alaska, as a creator, culture hero, and trickster in a cycle of myths that included those of the earth diver and the origin of the light. The Raven, however, played a negligible role in religious practices.

The differences between and sometimes vagueness in Inuit religious ideas may be related not only to their wide and scattered distribution but also to the fact that their societies had a loose social organization and were without a written language before contact with the Europeans. For all Inuit, however, a close and good relationship with the animals on which they depended for their survival was believed to be of vital importance.

BIBLIOGRAPHY

An excellent survey of Inuit culture from prehistoric to modern times is given in the *Handbook of North American Indians*, vol. 5, edited by David Damas (Washington, D.C., 1984). The best survey of Inuit religion is Margaret Lantis's article "The Religion of the Eskimos," in *Forgotten Religions*, edited by Vergilius Ferm (New York, 1950), pp. 311–339. Lantis is also the author of *Alaskan Eskimo Ceremonialism* (New York, 1947). This well-documented book is based primarily on literary sources, but it also contains Lantis's field notes from Nunivak. A review of the religion of the Inuit in Canada and Greenland has been written by Birgitte Sonne and myself as an introduction to a collection of plates that illustrate the religious life of these people in *Eskimos: Greenland and Canada* (Leiden, 1985), vol. 8, pt. 2, of the series "Iconography of Religions." A strong visual impression of the Bering Sea Inuit culture in the nineteenth century is found in William W. Fitzhugh and Susan A. Kaplan's *Inua: Spirit World of the Bering Sea Eskimo* (Washington, D.C., 1982). This is a fascinating book that examines how the spirit world manifests itself in all areas of the life of these Inuit. A study of the religion of two Inuit groups in Canada is given in J. G. Oosten's *The Theoretical Structure of the Religion of the Netsilik and Iglulik* (Mappel, Netherlands, 1976). Information that has been gathered on rituals in connection with animals is presented in Regitze Soby's article "The Eskimo Animal Cult," *Folk* (Copenhagen) 11/12 (1969–1970): 43–78. The position of the Inuit shaman has been analyzed by Birgitte Sonne in "The Professional Ecstatic in His Social and Ritual Position," in *Religious Ecstasy*, edited by Nils G. Holm (Stockholm, 1982), pp. 128–150, and by Daniel Merkur in his *Becoming Half Hidden: Shamanism and Initiation among the Inuit* (Stockholm, 1985).

Among the many valuable and often quoted books by Knud Rasmussen is *The Netsilik Eskimos: Social Life and Spiritual Culture* (Copenhagen, 1931). This book presents material that Rasmussen collected from various groups of Inuit who had had limited contact with the Euro-American world. Among the many valuable studies on the Alaskan Inuit, two should be mentioned: Robert F. Spencer's *The North Alaskan Eskimo: A Study in Ecology and Society* (Washington, D.C., 1959) and Ann Fienup-Riordan's *The Nelson Island Eskimo: Social Structure and Ritual Distribution* (Anchorage, Alaska, 1983).

An extensive bibliography for Inuit religion is given by John Fisher in his article "Bibliography for the Study of Eskimo Religion," *Anthropologica* n.s. 15 (1973): 231–271.

Revised Bibliography

INVISIBLE RELIGION. The term *invisible religion* was introduced by the German sociologist Thomas Luckmann and became widespread following the publication in 1963 of *Das Problem der Religion in der modernen Gesellschaft*, published in English as *The Invisible Religion: The Transformation of Symbols in Industrial Society*. The concept of invisible religion emerged from the difficulty of maintaining a traditional religious life in societies to which the industrial revolution brought radical differentiation processes, both in social structures and ways of living, as people were forced, in mounting progression, to change residences, workplaces, habits, and worldviews. Luckmann agrees with sociologists who consider the secularization trend, which they view as a crisis of ecclesiastic-oriented religion, as irreversible. On the other hand, and more importantly, Luckmann extends the significance of religion by arguing that one's worldview, as an objective social and historical reality, fulfills an essentially religious function. This "elementary social form of religion," according to Luckmann, is universal in human society.

In his book, Luckmann considers the notion—diffused in nineteenth-century philosophy and among the secularization theorists of the following century—that modern life is without religion, if not essentially areligious; that is, that the "irrationality" of religion should yield precedence to the "rationality" of modern life. Luckmann argues that this idea is partially wrong. It is true that, unlike Australian aboriginal societies and those of ancient Egypt and medieval Europe, postindustrial societies seem secular and rationalistic. Their political and economic institutions no longer need traditional legitimizations, especially religious ones. Most people living in modern industrial societies do not consider themselves to be tied to each other by officially institutionalized religious communities, dogmas, and religious rituals. Taking all these circumstances into account, Luckmann agrees that modern social structures are "secular." Nevertheless—and this is his central thesis—human beings in modern societies, no matter how much their lives differ from that in other cultures and

societies, have not lost the “religiousness” that has characterized human life (as opposed to the lives of other species) since ancient times. Therefore, even the deep social and cultural changes that produced “modernity” have not changed the fundamentally religious nature of human existence.

In his analysis of the “religious nature of human existence,” Luckmann refers to the writings of his mentor Alfred Schutz (1899–1959), particularly those dealing with the concepts of “appresentation” and “symbol/transcendence.” Schutz claimed that when human beings perceive an object, they perceive directly only certain aspects of it, but other aspects that do not appear to them directly are immediately grasped as well. The directly perceived part of the object “appresents” the unseen part. Schutz also introduced a concept of transcendence that became important to Luckmann’s concept of religion. In his essay “The Transcendence of Nature and Society: Symbols” (1932). Schutz argues that everything that surrounds human beings (e.g., the world, the cosmos) goes “beyond” their direct experience of time and space. The social environment in which people live refers to a horizon of potential social environments, just as in space there exists an infinity of objects that cannot be reduced to the human capacity for manipulation and control—they are “beyond.” Humans can only apply to them appresentative references of a higher order, the “transcendent.” From this point Schutz tackles the issue of symbol, which he defines in the following way: “A symbol can be defined in first approximation as an appresentational object, fact, or event within the reality of our everyday life, whereas the other appresented member of the pair refers to an idea which transcends our experience of everyday life” (1962–1966, vol. 1, p. 331). Thus, the issue of transcendence is located, according to Schutz, in the appresentative relationship between two realities: fact, which is a part of everyday life; and idea, which transcends and refers to something other than everyday life.

The religious problem in Luckmann is based on this relationship, to which he confers a social dimension. Luckmann distinguishes the *transcendent*, which is such only in relation to what is referred as “immanent,” from *religion*, which is normally seen as the whole of human experience made visible and localized in symbols, holy places, and holy temples, and the people and activities concerned with them. All this is evident, according to Luckmann, in the case of tribal religions, ancestral cults, universal religions (especially when institutionalized under the form of churches and sects), and so on. Furthermore, the historical institutionalization of the symbolic and sacred nucleus of a worldview is included in the specifics of a universally human social process. The fundamental function of religion is therefore to transform the members of the species *Homo sapiens* into actors belonging to a specific historical-social order. Any component of social reality that is essential to this function can be legitimately called *religious*, whether or not it refers to the supernatural explicitly or implicitly.

Luckmann insists that the fundamental function of religion—that is, the transformation of the members of a species

into morally responsible actors within a social order—is motivated by historical deposits of social interaction: “The objectivation of a symbolic universe as a system of meaning presupposes that the subjective experiences entering into its construction be meaningful. The meaningful quality of subjective experience, however, is a product of social processes” (1967, pp. 44–45). This meaningfulness is a “quality,” so “it is inkeeping with an elementary sense of the concept of religion to call the transcendence of biological nature by the human organism a religious phenomenon. . . . We may, therefore, regard the social processes that lead to the formation of Self as fundamentally religious” (p. 49).

Here Luckmann’s approach diverges from that of Schutz. The concept of transcendence in Schutz is born from the experience of going beyond the contingent that every person experiences everyday. Thus, the present natural and social environment refers to a horizon of potential natural and social environments, and an opening is made manifest to a double transcendent infinity of the natural world and the social world. Transcendence, according to Schutz, marks the expressive limits and the limits of movement of human beings, while it also enables people to construct a complex net of socially approved terminals between significants and meanings. This “net” constitutes the symbolic activity of humans. The symbol, being a typically human construction, is a link between the two poles: (1) a fact or an event within the reality of everyday life, and (2) an idea that transcends everyday experience.

In accordance with the research of anthropologists, ethnologists, and historians of religion, Schutz considered hierogenetic and mythopoetic activities to be typical activities of the human mind. The framework in which Luckmann locates the notion of transcendence is more radical. He strongly emphasizes its social construction as the giver of meaning to the symbolic process because “it is true that a genuinely isolated subjective process is inconceivable” (1967, p. 45). He also recovers the terms *religion* and *religious*, qualifying them as intrinsic modalities to the self’s transcendent process and to the world belonging to the symbolic-cognitive aspects of the human species. Such a process presents a twofold modality: (1) an organism becomes a self when devoting itself with others to the construction of a universe of objective and moral significance; and (2) transcendence of biologic nature is a universal phenomenon of humankind. Luckmann identifies in the formation of consciousness and conscience “the universal yet specific anthropological condition of religion” (1967, p. 49).

According to Luckmann, the worldview as an “objective and historical social reality performs an essentially religious function and can be defined as an *elementary form of religion*” (1967, p. 53). In turn, religion as traditionally intended can be defined as a worldview with “social, objective, and historical reality.” Religion manifests itself in particular social institutions that are the product of the articulation of a sacred cosmos within the worldview, which is in turn constituted

by a set of representations that refer “to a domain of reality that is set apart from the world of everyday life” (1967, p. 61). According to this perspective, religious representations constitute a sacred universe definable as a specific and historical form of religion.

Throughout history there have existed societies characterized by a diffusion of religious ceremonies that were expressed through experience and the acknowledgment of the extraordinary. But the boundary between everyday life and the extraordinary is far from clear-cut; therefore, theoretical elaboration of the sacred did not occur. Societies belonging to this type (especially the simpler and more primitive forms of social organization, such as societies of hunters and gatherers) show a remarkable variety of cultural content, in spite of their basic similarities in social structure and in their social, “diffused” form of religion. According to Luckmann, a transformation of great importance in the social form of religion is an element of the framework of socio-structural “adaptations” of the so-called agricultural revolution. Sedentary life, high population density, urbanization, and the institutionalization of power are associated with a marked growth in the institutionalization of religious ceremonies, which, in relation to centralized power and the canonization of sacred life, could lead to a high level of stability in the theocratic variants of ancient hydraulic civilizations. In the West, the next great transformation consisted in the complete specialization of religious ceremony, and eventually in the appearance of the problems associated with pluralism and secularization.

In *The Invisible Religion*, Luckmann examines some of the most important conditions characterizing the institutionalization of religion in the post-Constantine church. Such a process constitutes the background of what was his main interest: the raising of a new, “privatized” social form of religion in the industrial societies of the West. As for the relationship between individual religiosity and social forms of religion, Luckmann maintains that in tribal societies an individual religiosity is modeled exclusively by the social form of religion relatively diffused, whereas in societies characterized by the presence of a “theocratic” institutionalization of religious and political forms, the modeling of individual religiosity by the social form of the prevailing religion remains similar, despite a more complex stratification of society. Churches present the individual with “official” models. But other models begin to enter into competition—and when conditions of pluralism are established for economic and political reasons, the circumstances under which full institutional specialization can succeed cease to exist.

According to Luckmann, if at least one religion is accessible in the condition of “diffused” politico-religious and specialized institutionalization, the individual can deviate from such forms of religion for merely contingent reasons. But if other models are in competition, various systematic types of individual religious development are possible: fundamentalism, syncretism, new religious movements, a return to tradi-

tional devotion, or detachment from any form of religion. In the case of institutional specialization, orthodox and heterodox models are in competition. The privatized social form of religion is characterized by the fact that—from a sociological point of view—talking of orthodox and heterodox models makes little sense. In fact, in an interview granted to the Italian journal *Religioni e Società* in 1986, Luckmann stated that:

A wide range of different actors are involved on the social scene in the social constructions of several kinds of transcendence. The fundamental structure of the process is the one of a “market.” There are mass media and there are Christian churches that, in addition to being monuments to a former period characterized by institutional specialization of religion and despite some restoring and fundamentalist tendencies, are trying to reinsert in the processes of modern social constructions of transcendence. Moreover sub-institutional communities have emerged, more or less recent and religious (in the traditional sense), which are trying to play an important part in this process. (Prandi, 1986, p. 37)

Luckmann’s complex theory thus comes to the idea that, in modern life, social structure has ceased to mediate coherently between subjective conscience and its experiences of transcendence, and between the communicative reconstruction of such experiences and the competing social constructions of the “sacred universes.” At any rate, the present co-location of religion in society—that is, its privatization—is not characterized by something that *is*, but rather by something that *is not*. It is characterized by the absence of compulsory social models, generally plausible with regard to persistent universal human experiences of transcendence.

CARLO PRANDI (2005)

IOANN OF KRONSTADT (Ivan Il'ich Sergeev, 1829–1908), also known as John of Kronstadt, was a Russian Orthodox priest. Ioann was born in the village of Suro in the Arkhangelsk province of Russia and at the age of ten was sent to the parochial school in Arkhangelsk. He later entered the seminary there, finishing at the top of his class in 1851. He then enrolled in the Theological Academy of Saint Petersburg, one of the four graduate faculties of theology in the empire. High-strung, physically weak, overworked, and radically committed to his life of study, prayer, ascetic discipline, and spiritual struggle, Ioann suffered greatly during these academic years. An added burden was the constant necessity to support himself by outside work. He finished the academy near the bottom of his class in 1855, was ordained deacon on November 11 of that year, and priest on the very next day.

Before accepting priestly ordination, Ioann dreamed of becoming pastor of Saint Andrew's Cathedral in the port city of Kronstadt, a naval base and penal colony on the island of Kotlin in the Gulf of Finland near Saint Petersburg. Kronstadt, teeming with outcasts and criminals, was notorious as a place of dirt, darkness, and sin. Because parish priests as a rule could not be celibate, Ioann married Elizaveta Nesvitskii, the daughter of Saint Andrew's retiring pastor, but he never consummated the marriage, a fact that has caused much debate because it remains unclear whether the bride had consented to such an arrangement.

Ioann served as pastor of the Kronstadt church until his death on December 20, 1908. His priestly career was distinguished by numerous acts of social, charitable, and educational work, both personal and institutional. Ioann established philanthropic agencies such as the Home for Constructive Labor, which provided free schools, workshops, training centers, libraries, counseling services, medical care, and food, for people of all ages. He also taught religious classes in the parish school for thirty-two years, not freeing himself from this obligation until 1889.

Ioann's greatest fame, however, was not as a philanthropist or a pedagogue but as a man of prayer. He was sought by people of all classes and religions from all parts of the Russian empire and beyond as an intercessor before God. From early in his priestly career he began the unprecedented practice, even for monastics, of celebrating all of the Orthodox church services every day, including the eucharistic liturgy. He did so with great fervor and devotion, spending long hours at the altar praying for those who begged his intercession. He often added his own words to the official church prayers and always insisted that the thousands of people who

thronged to his church each day participate fully in the worship by receiving Holy Communion. To make this radically innovative practice possible, Ioann further instituted public confession whereby the crowds of penitents openly acknowledged their sins before all while the praying priest walked about the church bestowing absolution and offering counsel.

Ioann, who had come to be known as the "all-Russian pastor," was violently attacked by his detractors for his radical practices, and only the protection of the tsar kept him from becoming the object of punitive action. His spiritual diary, *My Life in Christ*, is a classic of contemporary Russian Orthodox spirituality.

BIBLIOGRAPHY

Ioann of Kronstadt's spiritual diary, *Moia zhizn' vo khriste* (*My Life in Christ*), is available in the original Russian (Moscow, 1892), and in English translation by Ernest E. Goulaeff (1897; reprint, Jordanville, N. Y., 1971). English excerpts from this work can be found in *The Spiritual Counsels of Father John of Kronstadt*, edited by W. Jardine Grisbrooke (London, 1967; Greenwood, S.C., 1983), and G. P. Fedotov's *A Treasury of Russian Spirituality* (1950; reprint, Belmont, Mass., 1975). A two-volume work in Russian analyzing Ioann of Kronstadt's life and work, containing letters, photographs, and a church service in his honor, is I. K. Sur-skii's *Otets Ioann Kronshtadtskii* (Father John of Kronstadt), 2 vols. (Forestville, Calif., 1979–1980). The best work in English is *Father John of Kronstadt: A Life*, by (Bishop) Alexander Semenov-Tian-Chansky (Crestwood, N.Y., 1979).

THOMAS HOPKO (1987)

IPPEN (1239–1289), also known as Chishin; a Japanese holy man, founder of the Jishū, an order of Pure Land Buddhist itinerants. Ippen was born in the province of Iyo (modern Ehime Prefecture) to a long-powerful military clan, the Konō, which had recently suffered a serious defeat in the Jōkyū War of 1221. Ippen's grandfather died in exile, and Ippen, three of his brothers, and his father all became monks. At the age of twelve, Ippen was sent to Kyushu to study the doctrines of the Seizan branch of the Jōdo (Pure Land) sect. Upon the death of his father in 1263, he returned to household life in Iyo. Perhaps because of intraclan strife, he left home again eight years later, and spent the rest of his life on the road as a holy man (*hijiri*).

Ippen initially went on pilgrimages to the great Buddhist temples and Shintō shrines and underwent austerities in the mountains of Shikoku. While on a pilgrimage to Kumano in 1274, he had the climactic experience of his life. The Shintō deity (*kami*) of the main shrine, believed to be a manifestation of Amida Buddha, appeared before him and commanded him to distribute to all people, regardless of their belief or unbelief, purity or impurity, paper talismans (*fuda*) on which were printed the words "Namu Amida Butsu" ("Homage to Amida Buddha"). This Ippen did for the rest of his life, traveling throughout the Japanese archipelago.

By 1278, Ippen had attracted a small group of followers that he called the Jishū, or “time group,” referring to its chanting of Amida’s name at all times. Before his death, this group numbered perhaps more than two hundred men and women, and Ippen had established rules for group poverty and incessant wayfaring. In addition, he had enrolled 251,724 names in a register of lay supporters.

In 1279, this Jishū began its distinctive dance (*odori nembutsu*) celebrating the instantaneous salvation available in Amida’s name. Originally spontaneous and ecstatic, the dance became a regularized performance by members of the Jishū on the grounds of shrines and temples, and in other public areas such as beaches and markets. After being brutally driven out of Kamakura, the shogunal capital, in 1282, Ippen led his Jishū to the provinces around the imperial capital (modern Kyoto). Here he met with great success and was even invited to many notable temples and shrines. In 1288, Ippen led his group to his home in Iyo and then back across the Inland Sea, where he died in 1289. He is buried near the modern city of Kobe.

Ippen interpreted the Pure Land sutras to mean that Amida’s enlightenment and the rebirth (*ōjō*) of all beings into Amida’s Pure Land were precisely the same event. Since Amida’s enlightenment had occurred ten *kalpas* ago, so too must have the rebirth of all beings. Both, furthermore, had their origin in “Namu Amida Butsu,” the “six-character name” established through the vows Amida had made while still a bodhisattva. For this reason, the name alone was sufficient to effect the rebirth attained ten *kalpas* ago and to obliterate the distinctions between then and now, between this world and the Pure Land, and indeed between all beings and buddhahood. Ippen’s paper talismans, therefore, immediately saved all who received them, regardless of their faith, practice, or morality. The dance served as a celebration of this absolutely universal salvation.

Ippen’s thought was largely derived from that of the Seizan branch of the Jōdo sect, itself strongly influenced by Esoteric (*mikkyō*) Buddhism. His originality lay in using these ideas to employ for Buddhist salvation existing popular traditions of shamanistic holy men and magic. The Jishū became the largest itinerant order of medieval Japan, absorbing earlier, similar groups, and several of its members were important in the literature and arts of the Muromachi period (1338–1573). Many samurai supported the Jishū, attracted by its endorsement of Shintō, and used its members both as a cultural entourage and as participants in funeral and memorial services. The fortunes of the order declined dramatically, however, with the turmoil that swept the country at the end of that period, and the Jishū continues in the early twenty-first century as only a minor Buddhist sect with headquarters in the city of Fujisawa.

Nevertheless, the practices and beliefs of the Jishū were widely diffused among the Japanese during the medieval period. Ippen’s dance, for example, continues as a feature of folk Buddhism in several regions and is tied to the legendary

founding of the Kabuki theater. The *Ippen hijiri e* (Illustrated life of the holy man Ippen), a work of twelve scrolls completed in 1299, is one of the masterpieces of Japanese painting and the single most important source for studying popular life in thirteenth-century Japan.

JAMES H. FOARD (1987 AND 2005)

IQBĀL, MUḤAMMAD (1877–1938), influential Muslim poet-philosopher of the Indian subcontinent. Born at Sialkot (presently a Pakistani town on the border of India), Iqbāl received his early schooling in his native town and his college education at Lahore (where he studied philosophy with the British Islamicist T. W. Arnold). In 1905 he went to Europe, where he followed M^r Taggart’s lectures in philosophy, took his doctorate from Munich with a thesis on the development of metaphysics in Persia, and was called to the bar from Lincoln’s Inn in London in 1908. In the same year he returned to Lahore where he taught for a while at the Government College and pursued a hectic but unsuccessful law practice. He was knighted in 1922 for his contributions to poetry (about 60 percent of which is in Persian and 40 percent in Urdu). In 1927 he was elected to the Punjab Legislative Assembly, and in 1930 he gave the historic presidential address to the annual session of the Muslim League at Allahabad, wherein he suggested that the solidly Muslim areas of northwest India might be given autonomy so that Muslims could run their affairs according to Islamic norms, the idea that later took the shape of Pakistan. During his last years he was often ill and did not appear in public after April 1936. He died on April 21, 1938, and was buried in the complex of the Imperial Mosque of Lahore. Iqbāl’s commitment to the creation of Pakistan was a direct result of his philosophic thought, which was so powerfully expressed in his poetry.

Iqbāl had displayed his unusual talent as a moving and eloquent poet with a “grand style” even in his college days. Before going to Europe he had been a Platonic idealist, an Indian nationalist, and a romanticist of the past who sang hymns to the Himalayas, to intercommunal understanding, and to universal love. In Europe, he discovered Islam with a vengeance, having been shocked by his experience of the European double standards that combined liberal morality

and democracy at home with colonial exploitation abroad and, even at home, with the capitalistic exploitation of the working classes. Coupled with this disillusionment he saw the increasing dilapidation of human values in the machine age and the decline of the family institution. But looking at the Eastern and particularly the Muslim societies, he found them in deep somnolence. At this point, he discovered the “true Islam” of the Qurʾān and of Muḥammad, an Islam that was dynamic and not static; in its dynamism he discovered a creative impulse that directed the raw materials of history into a positive moral channel. The modern West, unlike the world of Islam, was industrious enough, but it lacked a positive moral direction for the uplift of humanity; it was inventive but not creative and was, in fact, destructive to the human moral fiber. Henceforth, he invited the whole world, both Muslim and non-Muslim, to join this energizing and ethically positive Islam.

In the development of this dynamic philosophy, which is expressed in Bergsonian vitalistic terms (although unlike Bergson, Iqbāl regards God as being outside the process of history), the key role is played by the twin terms *khudī* (“self”) and *‘ishq* (“absorbing love,” or *élan vital*). The goal of this ethical dynamism is to expand and fortify the self (which is the only way to individual survival after death), since only when an enlarged and fortified self is realized can a meaningful community of the faithful be launched on earth as the prophet Muḥammad was able to do. Although in the early years of his intellectual development after his discovery of Islam Iqbāl was not optimistic about a similar reawakening on the part of the Muslim community at large, he did eventually come to place his faith in such a development. Through both his poetry and his major prose work, *The Reconstruction of Religious Thought in Islam* (chapter 5), he tried to urge Muslims to create a new future through *ijtihād*, literally “exerting oneself,” a Muslim legal term for independent reasoning, which Iqbāl used to describe the exercise of new creative thought within the framework of Islam.

Iqbāl, who had been known as a good poet in Urdu early on, first indicated his concern with the Muslim cause in the two great poems *Shikwāh* (Complaint) and *Jawāb* (Answer, that is, God’s response to the complaint), but he subsequently turned to Persian in order to reach a larger group of educated Muslims. His *As-rār-i khudī* (Secrets of the self), first published in 1915, speaks of that individual human core that should be strengthened until it reaches its highest fulfillment. The duties of this “self” in the community were discussed two years later in the *Rumūz-i bīkhudī* (Mysteries of selflessness). The Persian collection *Payām-i mashriq* (Message of the East) acknowledges Iqbāl’s spiritual debt to Goethe, who was his Western guide as much as Mawlānā Rūmī was his Eastern master. His major Persian work is the *Jāvīd-nāmāh* (Jāvīd’s book), written for his son in 1932. In this spiritual journey through the spheres in Rūmī’s company, he discusses religious, political, and social

problems with Muslim and non-Muslim poets and thinkers alike. Among his Urdu poetry, *Bāl-i Jibrīl* (Gabriel’s wing) is outstanding.

The titles of Iqbāl’s works point to his understanding of himself: he wanted to use “the rod of Moses” (*zarb-i kalīm*) and assumed the role of “the sound of the camelbell” (*bāng-i darā*) that had led the Muslims in the caravan of the Prophet back to Mecca. The general impression among Westerners that Iqbāl indulged in romanticization of the past glory of Islam is not correct. While he did show romanticizing tendencies before his “conversion,” after his discovery of the dynamic nature of Islam, he was anything but a romanticist of the past. He continually called for the creation of a new future, although he singled out, for the sake of inspiration, certain past achievements of the Muslims, as, for example, in his poem *The Mosque of Cordoba*, which appears in *Bāl-i Jibrīl*.

BIBLIOGRAPHY

Iqbāl’s collected Persian poetic works have been published in Tehran (1964) and in Pakistan (1973), while his collected Urdu poetic works were published in Pakistan in 1975 and reproduced in India in 1980. *The Reconstruction of Religious Thought in Islam* has had (like his poetic works) a number of printings, including a recent one from Lahore in 1960. A major part of his Urdu poetry has been translated into English by V. G. Kiernan under the title *Poems from Iqbal* (London, 1955); some of his Persian poetic works have been translated by Reynold A. Nicholson and A. J. Arberry, although several still await translation.

Translations into German by Annemarie Schimmel include *Payām-i Mashriq as Botschaft des Ostens* (Wiesbaden, 1963); *Jāvīd-nāmāh as Das Buch der Ewigkeit* (Munich, 1967); and *Muhammad Iqbal, Persischer Psalter* (Cologne, 1968), with selected poetry and prose. Iqbāl’s Urdu poetry has also been translated into German by Johann Christoph Bürgel as *Steppe im Staubkorn* (Bern, 1983). Italian translations by Alessandro Bausani include “Il ‘Gulshan-i raz-i ḡadid’ di Muhammad Iqbāl,” *Annali Istituto Universitario Orientale di Napoli*, n. s. 8 (1958): 125–172; *Il poema celeste* (Rome, 1952); and *Poesie di Muhammad Iqbal* (Parma, 1956). There are also French, Czech, Dutch, Arabic, and Russian translations available, and much of his work has been translated into the regional languages of Pakistan.

There has been a plethora of works on Iqbal, not all of good quality. The following three should give a comprehensive introduction to Iqbāl’s thought as well as his biography and bibliographies: Syed Abdul Wahid’s *Iqbal: His Art and Thought* (Lahore, 1944); Annemarie Schimmel’s *Gabriel’s Wing: A Study into the Religious Ideas of Sir Muhammad Iqbal* (Leiden, 1963); and *Iqbal: The Poet-Philosopher of Pakistan*, edited by Hafeez Malik (New York, 1971).

FAZLUR RAHMAN (1987)
Revised Bibliography

IRANIAN RELIGIONS. Because of the scarce and fragmented data in our possession, we do not know the religions of ancient Iran, other than Zoroastrianism, as organic systems endowed with a specific pantheon, a mythology, particular creeds, cosmogonic and cosmological ideas, and precise eschatological notions. We can postulate the existence of other religions only through a careful analysis of those elements contained within Zoroastrianism that can be linked to a pre-Zoroastrian paganism and through an Indo-Iranian comparison. That is to say, we have no sources, other than the Zoroastrian, for any Iranian religion. Some scholars have viewed as testimony of a non-Zoroastrian cult those few religious references found in the royal Achaemenid inscriptions (sixth to fourth century BCE), as well as Herodotus's mention of "the Persian religion" (1.131–132), although, as is well known, Herodotus never refers to Zarathushtra (Zoroaster). Given these meager materials, we cannot be sure that the cults referred to were not affected in some way or at some time by the Zoroastrian "reform." In fact, it is probably most prudent to consider the religion of the Achaemenids—whose inscriptions also never mention Zarathushtra—as belonging to the Zoroastrian tradition and as a stage in its troubled and complex historical development.

Having said this, it is nonetheless possible to reconstruct a few essential elements of ancient Iranian religions through traces of ideas and beliefs that appear to be independent of the Zoroastrian tradition. Some of these are completely original, but most are held in common with ancient, especially Vedic, India. Such elements pertain mainly to rituals, the pantheon, concepts of death and the afterlife, and cosmology.

Rituals included libations (*zaotbra*), offered both to *Āpas* ("water") and to *Ātar* ("fire"). The latter was called *Agni* by the Indians. The libations offered to water were a blend of three ingredients: milk and the juice or leaves of two plants. Those offered to fire were also a blend of three ingredients: dry fuel, incense, and animal fat. In both the libations to water and fire, called *āb-zōhr* and *ātakhsb-zōhr* in late Zoroastrian literature, we find the symbolism of the number three, which also occurs in a number of Brahmanic practices, as well as the blending of ingredients from the animal and vegetable worlds.

These offerings to water and fire, typical of a daily and familiar ritual, were also at the heart of the priestly ritual called the *Yasna* by the Iranians and *Yajña* by the Indians, from the root *yaz* ("sacrifice, worship"). Animal sacrifice was

certainly practiced in the oldest *Yasna* and was accompanied by prayers that made it sacred and justified it as a religious act through which the spirits of the household animals being sacrificed became absorbed into a divine entity called *Gēush Urvan*, the "soul of the bull." Herbs also played an important role in the *Yasna*, and the priest who carried out the sacrifice held a bundle of herbs in his left hand, called a *baresman* by the Iranians. In time the bundle of herbs was discarded in favor of a bundle of consecrated twigs.

Undoubtedly, *haoma* (*soma* in India) constituted a central element in the cult. The offering made to the waters at the conclusion of the *Yasna* was prepared by blending milk, the leaves of a plant, and the juice squeezed from the stems of a different plant. The substance's name, *haoma*, applied to both the sacrificial matter and its *yazata*, that is, the "being worthy of worship," or deity, whom it represented. *Haoma*, which was endowed with hallucinogenic and stimulating properties and was seen as a source of strength for warriors, inspiration for poets, and wisdom for priests, was extracted in a stone mortar during a preparatory ritual, after which the consecrated substance was consumed by the priests and by those taking part in the ceremony.

The premises, the instruments, and the ingredients for the ceremony were purified with water in a meticulous and careful way. Purifying and disinfectant properties were also attributed to cattle urine (*gōmez*), a substance that played an important role in the Zoroastrian ritual of the Great Purification, *Bareshnūm*, as well as in the initiation of priests and corpse bearers, in accordance with practices and notions that were certainly Indo-Iranian in origin.

Libations offered to water and fire, essential components in the ceremonial aspects of the cult, cannot be understood without an awareness of the complex symbolism linked to those two elements, both in Zoroastrian and pre-Zoroastrian Iran, as well as in ancient India. The Indo-Iranian background is particularly evident in the symbolism of fire: in the three ritual fires and in the five natural fires found in Iranian and Indian thought. We can trace the concept of the three fires, those of priests, warriors, and farmers, as well as the concept of five fires burning before *Ahura Mazda*, in the bodies of men, animals, plants, clouds, and the earth, respectively, to the Indo-Iranian background. Two *yazatas*, *Apam Napāt* ("grandson [or son] of waters") and *Nairyōsanha* ("of manly utterance"), are linked to and have Indian counterparts in *Apām Napāt* and *Narāśamsā*, an epithet for *Agni*, whose name also belongs to a different god in the Vedas.

Concerning the pantheon, an Indo-Iranian comparison provides considerable help in reconstructing the pre-Zoroastrian religious environment in Iran. There are many divine entities that derive from a common cultural heritage, although they do, at times, present significant differences. Particularly important in such comparisons is the section of the *Avesta* known as the *Yashts*, or hymns to the various *yazatas*, which mostly perpetuate the worship of gods from an

ancient, pre-Zoroastrian cult through a veil of Zoroastrianization after the fact. Worthy of mention, in addition to the cult gods Āpas, Ātar, Gēush Urvan, and Haoma, are the nature gods, such as Asman (“heaven”), Zam (“earth”), Hvar (“sun”), Māh (“moon”), and the two winds, Vāta and Vāyu. A juxtaposition with the Vedic religion clarifies many aspects of an ancient theology dating back to a period that we can definitely call proto-Indo-Iranian. According to some scholars, a few of these divine beings, as well as others well known to the Zoroastrian tradition, such as Zrvan (Zurwān) and Mithra, were originally high gods of Iranian religions other than the Zoroastrian and were thus in competition with Ahura Mazdā, the creator god of Zoroastrianism. Apart from a few specific details in the theories propounded by various scholars (H. S. Nyberg, Stig Wikander, Geo Widengren), and apart from the complex question of the so-called Zurvanist heresy, it is hard not to recognize a certain degree of verisimilitude in their reconstructions, as we find embedded in the Zoroastrian tradition, and not only in the *Yashts*, clear traces of a plurality of heterogeneous elements gradually absorbed and modified.

The Iranian pantheon, like the Indian, was subdivided into two main groups of divine beings, *ahuras* and *daivas*, although there exists sufficient evidence to hold that in Iran the latter word at one time indicated the gods in general. This can be inferred from the Avestan expression *daēval/mashya*, analogous to the Vedic *deva/martya*, to which correspond the Greek *theoi/andres* (*anthrōpoi*) and the Latin *dii/hominesque*, all of which mean “gods and men.” *Daivas*, as gods of an ancient polytheism condemned by Zarathushtra, acquired negative connotations only with the Zoroastrian reform. This happened also with some of the Indo-Iranian gods, such as Indra, Saurva (Śarva in India), and Nānhaithya (Nāsatyā in India). The term *ahura* (“lord”; *asura* in India), on the other hand, maintained its positive connotations and became part of the name of the supreme god of Zoroastrianism, Ahura Mazdā, as well as being attached to the name of some of the ancient gods from the Indo-Iranian pantheon, such as Mithra (Mitra in India) and Aṣam Napāt.

We are not able to establish whether, behind the image of Ahura Mazdā, which was probably created by Zarathushtra himself, there lies the Vedic Indian god Varuṇa or an Indo-Iranian god named Ahura or Asura. This problem, however, is not critical, for even if Zarathushtra’s god were a sublimation of the ancient Varuṇa by the Iranian prophet’s great religious reform, Varuṇa would certainly have already attained a higher status than that of other gods, such as Mitra or the other sovereign gods of the Indo-Iranian pantheon (Dumézil, 1968–1973).

If the Iranian Mithra corresponds to the weaker Indian Mitra, then Anāhitā, the other great divine being of the triad mentioned in the Achaemenid inscriptions, corresponds to the Indian Sarasvatī, through the Avestan Aredvī Sūrā Anāhitā. The latter, however, presents some very complex

problems. Most likely, this ancient Indo-Iranian goddess was subject at an early date to the influence of religious concepts belonging to the Anarian substratum of the Iranian world. Even Herodotus (1.131), speaks of an “Assyrian” and an “Arabian” origin of the great goddess, who certainly shows traits typical of the Great Goddess of the most ancient settled civilizations of the Near and Middle East. In fact, in attempting to reconstruct Iranian religions other than Zoroastrianism, one must rely heavily on elements obtained through an investigation of the Indo-Iranian background. One must, however, try to ascertain, with the help of archaeological findings, what part was played by the Anarian substratum, from the Elam civilization to the so-called Helmand civilization, which came to light in the 1960s during excavations at Shahr-i Sokhta, in Iranian Seistan. A thorough investigation into more recent times is also necessary in order to see whether there are to be found, among the religions of the Hindu Kush, between Nuristan and Dardistan, any fossilized remains of ancient proto-Indo-Aryan religions (Jettmar, 1975; Tucci, 1977).

An Indo-Iranian comparison also provides many other elements pertaining to the pantheon, as well as mythical figures and epos. The latter has been the object of particularly detailed study in recent decades (Dumézil, 1968–1973; Wikander, 1949–1950; Molé, 1953). In this context, we find cast in a leading role the Iranian god Verethraghna, whose Indian name, Vṛtrahan (“slayer of the dragon Vṛtra”), is an epithet of the god Indra. Behind the sacred figure of Verethraghna, who represented victory in the Zoroastrian tradition, was, most likely, the idea of overcoming an obstacle to the activity of the cosmos, which is manifest through the flow of waters.

In the cosmogony of pre-Zoroastrian Iran, we find signs of a myth of separation of heaven and earth, in which the figure of Vāyu, the god of wind and of the atmosphere, the intermediate zone, must have played an important role. It is likely also that the doctrine of seven consecutive creations, of the sky, of water, earth, vegetation, animal life, man, and fire, which we find in late sources, in fact dates from very ancient times.

Essential elements are also provided by an Indo-Iranian comparison in matters pertaining to cosmology. Both Iranians and Indians believed that the world was divided into seven regions, whose Avestan name was *karshvar* (Pahl., *kēshwar*; Skt., *dvīpa*), and that it was surrounded by a mountain range. The central region was called Khvaniratha in Iran and Jambūdīvīpa in India, and at its center was a high mountain, called Mount Harā in Iran and Meru or Sumeru in India. South of the mountain was the Tree of All Seeds, just as, in Indian cosmography, we find the Jambū Tree south of Mount Meru. The Tree of All Seeds was thought to be at the center of the great sea Vourukasha, to the south of the mountain standing at the center of the world, also called, in Avestan, Hukairya (“of good activity”) or, in Pahlavi, Hukar and Caḡād i Dāidīg (“the lawful summit”).

The views of death and of the afterlife in the most ancient Iranian religions, before the Zoroastrian reform, seem to have included the survival of the soul (*urvan*). After wandering around the earth for three days, the soul was thought to enter a gray existence in a subterranean world of shadows, ruled by Yima, the first king, or king of the Golden Age, and the first man ever to have died. (The figure of Yima seems to correspond, although not without some question, to the Indian Yama.) There also appears to have been a notion of survival of a sort of “double” of the soul, the *fravashi*, linked to a concept of immortality typical of an aristocratic and warrior society, in which were present the values of the Indo-Iranian *Männerbund* (Wikander, 1983). There was, as well, the idea of a terrible trial to be overcome by the dead man’s spirit: the crossing of Chinvat Bridge, a bridge that could become wider or narrower, to the width of a razor’s edge, depending on whether the dead man had been just (*ashavan*) or evil (*dregvant*). There was probably a test, analogous to this trial after death, used in initiation rites (Nyberg, 1966).

Traces of a common concept of initiation can be found in both Iran and India. It is related to the basic Indo-Iranian religious idea of *asha* (in the Avesta) or *ṛta* (in the Vedas), which remained central even in Zarathushtra’s reform, although modified by partly new and different aspects. If we compare the Indian and the Iranian ideas, we can see clearly that a vision of *asha* (or of the sun, which, in turn, is the visible manifestation of the Vedic *ṛta*), was considered by both as a step in the spiritual fulfillment of the believer, who thus became *ashavan* (Av.; OPers., *artāvan*), that is, a participant in the supreme state of possessing *asha/ṛta*. In fact, the Indo-Iranian concept, which the Zoroastrian tradition transformed into one of the Amesha Spentas, contained various positive meanings, from that of truth (its exact translation) to that of a cosmic, ritual, and moral order. The Iranian *ashavan* (Pahl., *ahlaw/ardā[ry]*) and the Indian *ṛtāvan* stood, although with different shades of meaning, for “the initiate” and, more generally, for those who, alive or dead, would succeed in penetrating a dimension of being or existence different from the norm.

The idea of the need for an initiation in order to achieve the supreme state of *asha/ṛta*, held in common by the ancient Indo-Iranian world and by what we may call “Aryan mysticism” (Kuiper, 1964), was also linked to the experience of illumination and of the mystic light. The blessed state of *asha* manifests itself through light (*Yasna* 30.1), and *asha* is to be found in “solar dwellings” (*Yasna* 53.4, 32.2, 43.16). The initiate is, then, first of all a “seer,” one who has access to the mysteries of the otherworld and who can contemplate a luminous epiphany.

The experience of a mystical light and a complex symbolism connecting spirit, light, and seed form part of a common Indo-Iranian heritage and constitute, therefore, specific elements of an ancient Iranian religion that precedes Zarathushtra’s reform. It may not be pure coincidence that we find in the *Gāthās* no mention by Zarathushtra himself

of the concept of *khvarenah* (“splendor”), which was a notable aspect of Iranian religious thinking; yet we see it becoming part of the Zoroastrian tradition, as, for example, in *Yashts* 19. *Khvarenah* is a luminous and irradiating force, a sort of igneous and solar fluid (Duchesne-Guillemin, 1962), that is found, mythologically, in water, in *haoma*, and (according to an anthropological concept found in the Pahlavi tradition) in semen.

Khvarenah is an attribute of Mithra, of royalty, of divine and heroic figures belonging to a national and religious tradition, of Yima, of Zarathushtra, and of the Saoshyant; it does not have an exact Indian counterpart but is found in a context that, both literally and in terms of mythological structure, is strictly analogous to the Indian. In the Indian tradition, we find concepts concerning light—its splendor, its activity, its energy, and its effects—such as *ojas* (Av., *aojah*), *varcas* (Av., *varecāh*), and *tejas*, meaning, respectively, “strength,” “energy,” and “splendor,” concepts that closely resemble some in Iranian anthropology. The same adjective is used to describe “splendor” in both Iran and India: *ugbra* (Av.) and *ugra* (Skt.), meaning “strong.”

The Iranian religions other than Zoroastrianism, can, as we have seen, be partially reconstructed, not as organic systems, but rather in some of their particular and characteristic elements: cult and pantheon, cosmogony and cosmology, individual eschatology, anthropology, and psychology, as well as a concept of the experience of initiation substantially common to the entire ancient Indo-Iranian world. Such a common heritage was handed down in ancient Iran by schools of sacred poetry, which left their mark both on Zarathushtra’s *Gāthās* and on the *Yashts* of the Younger Avesta.

BIBLIOGRAPHY

Preeminent among general reference works on Iranian religions is H. S. Nyberg’s important *Irans forntida religioner* (Stockholm, 1937), translated by Hans H. Schaeder as *Die Religionen des alten Iran* (1938); 2d ed., Osnabrück, 1966. Among other invaluable references are Geo Widengren’s *Stand und Aufgaben der iranischen Religionsgeschichte* (Leiden, 1955); Jacques Duchesne-Guillemin’s *La religion de l’Iran ancien* (Paris, 1962), translated as *Religion of Ancient Iran* (Bombay, 1973); Geo Widengren’s *Die Religionen Irans* (Stuttgart, 1965), translated as *Les religions de l’Iran* (Paris, 1968); and Mary Boyce’s *A History of Zoroastrianism*, vol. 1 (Leiden, 1975).

On particular aspects of Iranian religions, the following works are recommended. On ceremonies, see Mary Boyce’s “*Ātaš-Zōhr* and *Āb-Zōhr*,” *Journal of the Royal Asiatic Society* (1966): 100–118. For a discussion of the Iranian pantheon and an Indo-Iranian comparison, see Émile Benveniste and

Louis Renou's *Vrtra et Vrthbragna* (Paris, 1934) and Stig Wikander's *Vayu* (Uppsala, 1941). On epos, see Stig Wikander's "Sur le fonds commun indo-iranien des épopées de la Perse et de l'Inde," *La nouvelle Clio* 1–2 (1949–1950): 310–329; Marijan Molé's "L'épopée iranienne après Firdōsi," *La nouvelle Clio* (1953): 377–393; Georges Dumézil's *Mythe et épopée*, 3 vols. (Paris, 1968–1973); and Prods Oktor Skjærnø, "Eastern Iranian Epic Traditions II: Rostam and Bhīśma," *Acta Orientalia Academiae Scientiarum Hungaricae* 51 (1988): 159–170. On the religions of the Hindu Kush, see Karl Jettmar's *Die Religionen des Hindukush* (Stuttgart, 1975) and Giuseppe Tucci's "On Swāt: The Dards and Connected Problems," *East and West*, n. s. 27 (1977): 9–103.

For discussion of the common Indo-European background of some concepts of the most ancient cosmography, see G. M. Bongard-Levin and E. A. Grantovskij's *De la Scythie à l'Inde: Énigmes de l'histoire des anciens Aryens*, translated by Philippe Gignoux (Paris, 1981). On the concept of the Iranian *Männerbund*, see Stig Wikander's *Der arische Männerbund* (Lund, 1983) and my "Antico-persiano *anušya-* e gli immortali di Erodoto," in *Monumentum Georg Morgenstierne*, vol. 1, "Acta Iranica," no. 21 (Leiden, 1981), pp. 266–280. For discussion of the concept of *asha* and Aryan mysticism, see F. B. J. Kuiper's "The Bliss of Aša," *Indo-Iranian Journal* 8 (1964): 96–129.

On initiation, see Jacques Duchesne-Guillemin's "L'initiation mazdéenne," in *Initiation: Contributions to the Theme . . .* edited by C. Jouco Bleeker (Leiden, 1965), pp. 112–118, and on the common Indo-Iranian background of initiation through possessing *asha* and the experience of light, see, in particular, my "Ašavan: Contributo allo studio del libro di Ardā Wirāz," in *Iranica*, edited by me and Adriano V. Rossi (Naples, 1979), pp. 387–452. See also Andrea Piras, "Visio Avestica, I: Prolegomena à l'étude des processus visuels dans l'Iran ancien," *Studia Iranica* 27 (1988): 163–185.

For comparison of the Indo-Iranian notions of *ojas/aojah*, *varcas/varecab*, and so on, see Jan Gonda's *Ancient-Indian 'ojas', Latin '*augos', and the Indo-Iranian Nouns in -es/-os* (Utrecht, 1952), pp. 57–67, and my "Licht-Symbolik in Alt-Iran," *Antaios* 8 (1967): 528–549. On the ancient Iranian tradition of sacred poetry, which was Indo-Iranian (and, more generally, Indo-European) in origin, see the various contributions by J. Wackernagel, Hans H. Schaeder, and Paul Thieme to *Indogermanische Dichtersprache*, "Wege der Forschung," vol. 165, edited by R. Schmitt (Darmstadt, 1968).

GHERARDO GNOLI (1987)

Translated from Italian by Ughetta Fitzgerald Lubin

IRENAEUS (c. 130–c. 200) was a bishop of Lyons (177/78–c. 200), theologian, and antiheretical writer. Claimed by both Roman Catholics and Protestants as their progenitor, Irenaeus framed the catholic concept of authority that helped to pull diverse churches together in a period of identity crisis created by gnosticism, Marcionism, and other movements. Opposing the radical accommodation of Christian thought to Hellenistic culture, he pointed to canon and creed as interpreted by bishops in churches of apostolic foundation.

Until the discovery of a gnostic library at Nag Hammadi (modern-day Chenoboskion, Egypt) in 1945, Irenaeus's treatise *Against Heresies* also supplied the main and most reliable information on gnostic thought.

LIFE. Nothing is known of Irenaeus's ancestry or of the date or place of his birth. He grew up, however, in Smyrna, where he sat at the feet of Polycarp, the distinguished bishop martyred about 155, who, according to Irenaeus, had known the apostles, specifically John, in Asia. From Polycarp perhaps he drew his penchant for biblical theology, for, he observed, Polycarp "related all things in harmony with the scriptures," which he then noted "not on paper, but in my heart." Irenaeus witnessed Polycarp's debate with Anicetus in Rome about 155 and studied in Justin's school, gaining much from Justin's apologetic methods but diverging sharply from him in his partiality for a biblical theology rather than for Platonism. After 164 he went to Lyons, where he was ordained a presbyter. He narrowly missed the pogrom that took place in Lyons and Vienne in 177, when Pothinus, the nonagenarian bishop of Lyons martyred in the persecution, sent him to Rome with a letter for Eleutherius (pope, r. 175–189) in which Pothinus characterized his protégé as "zealous for the covenant of Christ" and "among the first as a presbyter of the church."

On returning to Lyons, Irenaeus succeeded Pothinus as bishop. When Victor, bishop of Rome (189–199), rashly excommunicated the Christians of Asia because they observed Easter according to the Jewish Passover, whatever day of the week that might fall on, and not always on a Sunday, as in Rome, Irenaeus intervened with a stern rebuke. Writing in the name of "the brethren in Gaul," he pointed out that although variety of practice was customary among Christians from ancient times, they had always lived in peace with one another. Victor's predecessors in Rome, he added, all adhered to the Roman custom but did not excommunicate the Asians on account of a different practice. Anicetus and Polycarp once had a direct confrontation; although neither could persuade the other to change, they remained in communion with each other. Apart from his writing activities, little more is known about Irenaeus's career as bishop of Lyons. About 576 Gregory of Tours reported that Irenaeus was martyred in the persecution under Septimius Severus, but the lateness of the account makes this unlikely.

WRITINGS. Two major works of Irenaeus—*Refutation and Overthrow of Knowledge Falsely So-Called* (usually referred to as *Against Heresies*) and *Proof of the Apostolic Preaching*—have survived. In addition, three letters—one to Blastus, *On Schism*; a second to Florinus, *On Monarchy* or *That God Is Not the Author of Evil*; and a third to Victor on the Easter controversy—are quoted partially or wholly in the *Church History* of Eusebius. Other works have survived only in fragments or not at all, including a treatise against Valentinian gnosticism titled *On the Ogdoad*; an apology, *On Knowledge, against the Greeks*; and comments on scriptures under the title *Dissertations*. Irenaeus's works, especially the treatise

Against Heresies, circulated widely and exerted a widespread influence on Christian theology in subsequent centuries, particularly in the West.

Composed at the request of a friend and usually dated 185–189, *Against Heresies* is somewhat repetitious and disjointed. In book 1 Irenaeus outlines the gnostic system of Valentinus and his pupil Ptolemaeus and refutes it briefly on the grounds of inconsistency and diversity, especially in handling scriptures (in contrast to the unity of the catholic church's teaching); in a similar way he sketches and refutes the practices and thought of the Marcosians; and he gives thumbnail sketches of the variegated teachings of other heretical teachers or sects: Simon Magus (the archheretic, according to Irenaeus), Menander, Saturninus, Basilides, Carpocrates, Cerinthus, the Ebionites, the Nicolaitans, Cerdo, Marcion, Tatian, and the Encratites, Barbeliotes, Ophites, Sethians, and Cainites. In book 2 Irenaeus undertakes a more detailed rational refutation of the Valentinian system with its elaborate cosmology. In book 3 he constructs his famous argument for catholic teaching based on scriptures and tradition. In book 4 he pursues the refutation of Marcion (d. 160?) that he begins at the end of book 3. Following in the train of his teacher Justin, whose treatise *Against Marcion* is no longer extant, Irenaeus argues from scriptures the oneness of the God of the Old Testament and the God who had disclosed himself in Jesus of Nazareth. Christ bore witness to the God of the Old Testament; the scriptures of the Old Testament bore witness to the Christ of the New. In book 5 Irenaeus sustains chiefly the Christian doctrines of resurrection of the flesh, incarnation, and last things against gnostic "spiritualizing." Like his teacher Justin, Irenaeus adopts the eschatology of the *Revelation to John* with its expectation of the millennial reign of Christ.

The *Proof of the Apostolic Preaching*, long lost but rediscovered in an Armenian translation in 1904, is a catechetical treatise, addressed to a certain Marcianus, that Irenaeus describes as "a manual of essentials." Basically a summary of salvation history, the first part focuses on theological matters (divine monarchy, Trinity, baptism) and the second on christological matters (Jesus as Lord, Son of David, Christ, Son of God; the glory of the Cross; the kingdom of God). "Proofs" for various doctrines come principally from the Old Testament.

THOUGHT. Irenaeus, responding to gnostics and Marcionites rather than presenting an apology to Gentiles, rejected Justin's concept of the Seminal Logos who illuminated the minds of both Jews and Greeks. Although he could praise Plato faintly, he had few compliments for nonbiblical writers and writings. He placed his confidence, rather, in the Old Testament and in writings beginning to be collected into a New Testament. Against Marcion and some of the gnostics, he asserted vigorously that one and the same God inspired both. In his understanding of inspiration he came closer to the rabbinic concept of the spirit indwelling an individual who faithfully adheres to the established tradition of truth

than to the Greek mantic theory, but he never denied the latter. He regarded the Old Testament in the Greek Septuagint as canonical in its entirety. Although the limits of his New Testament canon are not clear, he left no doubt that it included at its core the four Gospels and thirteen letters of Paul.

In his polemic against the gnostics Irenaeus criticized especially their use of allegorical exegesis, but he himself resorted freely to this method even in interpretation of the New Testament, the first orthodox writer to do so. He struggled to solve problems posed by the Old Testament by way of a theory of progressive education of the human race; but, although biblical, he lacked historical sensitivity in treating of the Old Testament. In the final analysis, Irenaeus saw the basis of religious authority as the tradition committed to the churches by the apostles, as a collective and not as an individual witness. The "living voice," a continually renewed understanding of the church's heritage, was his actual authority.

Irenaeus's theology reflected throughout a strong biblical and especially Pauline slant. Against gnostic and Marcionite dualism he affirmed Jewish monotheism. One God, the creator, created *ex nihilo* and not through emanations (as in Valentinian gnosis). To prove at once the immanence and the transcendence of God, Irenaeus developed the distinctive doctrine of "the two hands of God." Through the Son and the Holy Spirit (or the Word and Wisdom), God acted directly in creation, not through intermediaries, and God continues to act in inspiration or revelation. Scholars have often tried to decide whether Irenaeus held to an "economic," or "modalist," concept of the Trinity (that God appeared at one time as Father, at another time as Son, at a third time as Holy Spirit), but the "two hands" doctrine is scarcely compatible with such a concept. For Irenaeus, God is the living God of the Old Testament. Although he counterbalanced this understanding with ideas drawn from the philosophical leanings of earlier apologists, he always leaned heavily toward the biblical side. Whereas Justin thought of the Logos as the hypostatized Divine Reason, for example, Irenaeus conceptualized the Logos as the Word of God depicted in *John* 1:1–14. Also, whereas Justin could call the Logos a "second God" (*deuteros theos*), a part of God, for Irenaeus the Logos is God—God self-disclosed.

Unlike his precursor Justin, Irenaeus was also profoundly biblical and Pauline in his doctrine of redemption. According to his famous recapitulation theory, Jesus traversed the same ground as Adam but in reverse. Through his obedience he overcame the powers that hold humankind in thrall—sin, death, and the devil. To establish his theory, Irenaeus contended that Jesus experienced every phase of human development—infancy, childhood, youth, mature adulthood—sanctifying each by obedience. On the basis of a comment in the *Gospel of John* ("You are not yet fifty," *Jn.* 8:57), he argued that Jesus lived to age fifty. To be sure, alongside the motif of Christus Victor in his recapitulation theory, Irenaeus also gave attention to the Greek concept of

divinization by way of the vision of God in the incarnate Son. "He became man," said Irenaeus, "in order that we might become divine." This idea, however, did not dominate his theology as did that of recapitulation. As Irenaeus used it, moreover, it had both Pauline and Johannine roots. Thus, although nodding to Hellenism, Irenaeus did not depart from a strong biblicism.

There has been much debate among Protestant scholars about Irenaeus's emphasis on free will. In opposition to the gnostic division of humankind into three groups—material, psychic, and spiritual—he insisted on the survival of freedom even after the fall. Distinguishing "image" (*eikon*) and "likeness" (*homoiosis*) in the *Genesis* account of creation, as did Valentinus, he held that the fall affected only the "likeness." The "image," the whole bodily and spiritual nature with no added supernatural gift, was unaffected. Loss of the divine "likeness," however, resulted in a disordered human nature, death, and enslavement to Satan. Thus every person is born in sin, but this does not mean, as it did to Augustine, inheritance of guilt. Realizing that moral responsibility necessitates freedom of choice, Irenaeus viewed sin as wrong moral choice by a responsible agent. Although this meant that he sometimes minimized the need for grace, he was far from being a forerunner of Pelagius (fl. 410–418), who emphasized "natural grace" almost to the exclusion of supernatural. The fall, Irenaeus would say, attenuated free will, although it did not obliterate it.

In his understanding of the church Irenaeus again reproduced much of Paul's thought. The church is Israel under a new covenant, the true Israel, the priestly people of God. Although he believed in a universal priesthood, Irenaeus nevertheless lacked Paul's concept of the church as the body of Christ. He understood the church rather as a corporation composed of individuals and seldom spoke of being "in Christ" or "in the Spirit."

Irenaeus did not comment at length on the sacraments. Baptism, according to him, is a sign of faith and marks the beginning of the Christian life. He presupposed adult baptism, although one allusion connected with his recapitulation theory has often been pressed in support of infant baptism. The Eucharist, or Lord's Supper, played a minor role in his thinking. With Ignatius he could designate it "the antidote of life," or with Justin he could say the elements were "no longer common bread." Yet he preferred the phrase "the new oblation of the new covenant." Rich as his writings were in the formation of catholic theology, however, he did not approach the medieval idea of transubstantiation. The Eucharist is a "sacrifice" of praise symbolic of the recapitulating death of Christ; it proclaims and sets forth Christ's saving truth, the *raison d'être* of the church.

Irenaeus's understanding of ecclesiastical authority has evoked fierce debate between Protestants and Roman Catholics, for the meaning of a crucial statement is uncertain. Citing Rome as an example of an "apostolic" church, "founded and organized by Peter and Paul," and possessed of a reliable

succession of bishops, Irenaeus added, "Ad hanc enim ecclesiam propter potiore principalem necesse est omnem convenire ecclesiam." Roman Catholics have preferred to translate this sentence as "For it is necessary that every church agree with this church on account of its more powerful authority"; Protestants as "For it is necessary that every church come together with this church on account of its greater antiquity." Lack of a Greek original makes certainty impossible.

In eschatology, Irenaeus followed in the footsteps of his mentor Justin. Indeed, he was more rigorous than Justin in demanding adherence to millenarian beliefs. Countering the gnostics' dualism, he attached great importance to the idea of general resurrection, and he insisted on a resurrection of the flesh. Curiously, unlike Justin, he expected the general resurrection and the Last Judgment of both human beings and fallen angels to precede the millennium. Citing Papias (c. 60–130), bishop of Hierapolis, he believed the devil and his angels (demons) would be consigned to an everlasting fire while the saints would reign with Christ during the millennium. This millennial vision capped Irenaeus's theory of the evolution of religion.

INFLUENCE. Irenaeus's integration of biblical and Hellenistic thought, more cautious than that of his predecessor Justin or his contemporary Clement of Alexandria, was to have a significant impact in subsequent centuries. Eastern theology adopted his *Christus Victor* motif and his idea of the perfectibility of human nature consummated in immortality. A strong emphasis on free will in Eastern thinking probably also has its roots in Irenaeus. In the West both Roman Catholics and Protestants have claimed Irenaeus and Augustine as their leading mentors. Roman Catholics have cited Irenaeus on authority, Protestants on the Bible. Neither, however, has felt entirely at ease with the bishop of Lyons. Although Irenaeus came up with a "catholic formula" for truth, he left much uncertainty about Rome's place in safeguarding it. Similarly, although he was basically a biblical theologian, the Protestant reformers felt uncomfortable with both his idea of authority and his "Pelagian" tendencies. In the present ecumenical climate, fresh studies of Irenaeus are aiding in the reexamination of theology that must inevitably accompany progress toward Christian unity.

BIBLIOGRAPHY

The standard text of Irenaeus's treatise *Against Heresies* is *Sancti Irenaei libros quinque adversus haereses*, 2 vols., edited by W. W. Harvey (Cambridge, U.K., 1857). A complete English translation can be found in volume 1 of *The Ante-Nicene Fathers*, edited and translated by Alexander Roberts and James Donaldson (1867; reprint, Grand Rapids, Mich., 1975). Irenaeus's catechetical work appears in two English translations: *The Demonstration of the Apostolic Preaching*, translated by J. Armitage Robinson (London, 1920), and *Proof of the Apostolic Preaching*, translated and annotated by Joseph P. Smith, S.J. (Westminster, Md., 1952) for the series "Ancient Christian Writers." The standard English biography of Irenaeus is F. R. M. Hitchcock's *Irenaeus of Lugdunum*

(Cambridge, U.K., 1914). Valuable comprehensive studies of Irenaeus's theology include John Lawson's *The Biblical Theology of Saint Irenaeus* (London, 1948) and Gustaf Wingren's *Man and the Incarnation: A Study in the Biblical Theology of Irenaeus*, translated by Ross Mackenzie (Edinburgh and Philadelphia, 1959).

E. GLENN HINSON (1987)

IROQUOIS RELIGIOUS TRADITIONS. The League of the Iroquois consisted, at the time of contact with Europeans, of five "nations" (the Mohawk, Oneida, Onondaga, Cayuga, and Seneca). In 1724, these groups were joined by the Tuscarora to form the Six Nations of the Iroquois. These tribes form part of a larger complex of Iroquoian-speaking peoples. The northern language group of which the members of the league are a part also includes the Saint Lawrence Iroquois, Huron, Wyandot, Susquehanna, Nottoway, Erie, Wenro, and Neutrals. The Cherokee form the southern language group. The separation between the northern and southern groups probably occurred between three and four thousand years ago, with further dialects developing over time.

Geographically, the early-seventeenth-century Iroquois inhabited the area from 42° to 44° north latitude and from 74° to 78° west longitude. In the late seventeenth century, the League of the Iroquois controlled territory from the Mohawk Valley in the east to Lake Erie in the west, and from Lake Ontario in the north to the mountains of western and south-central New York State and northwestern Pennsylvania in the south.

At contact the Iroquois were a matrilineal and matriloal people living in clusters of longhouses situated on hilltops. The villages were usually palisaded and semipermanent. The men involved themselves in hunting, fishing, and making war; the women took care of the fields and gathered berries, nuts, and roots. The clan mothers elected the fifty sachems, or chiefs, who guided the external policies of the league from Onondaga.

COSMOLOGY. The cosmological structuring of space into three tiers provides the Iroquois with the basic categories with which to interpret human experience. The sky world and the underworld represent extremes of both a spatial and an existential nature. The sky world is order, goodness, warmth, light, and life. The underworld is chaos, evil, coldness, darkness, and death. In the in-between world—the world of ordinary human experience—the qualities of both worlds are intertwined in a myriad of ways. One of the ways is cyclical, as when night follows day; another is antagonistic, as when good struggles with evil.

Mythically, this world was the creation of two twins, one good and the other evil. The former, the Master of Life, was the creator of flora and fauna. He held the sky world in mind at all times while creating living things, and he gave

customs to humans modeled after those of the sky world. His brother tried to imitate his creative acts, but what issued instead were all of the nasty, noxious, and monstrous forms of life. The evil twin is described as cold and hard, like ice and flint, and his influence is believed to infect all areas of existence. Each of the twins left behind spirit-forces and other manifestations of his orientation and power. The general thrust of Iroquois religion is toward increasing and renewing the power of those forces that sustain life and reducing or eliminating those forces that diminish life, such as disease and pain.

COMMUNITY RITUALS. To live in harmony with the spirit-forces is the essential requirement of Iroquois religion. These fundamental relationships that sustain community life are renewed, intensified, and celebrated in the calendrical cycles of the Longhouse religion. This final form of the Iroquois ceremonial cycle crystallized in the nineteenth century under the influence of the Seneca prophet Handsome Lake (1735–1815). The Longhouse religion, as it is practiced today, is a synthesis of elements from the hunter-gatherer traditions of the Middle Woodland and early Late Woodland periods (300–1000 CE) and the agricultural complex that gradually took hold during the Late Woodland period (1000–1500 CE).

The fundamental attitude of the Iroquois community toward the benevolent spirit-forces of the universe is thanksgiving. Thus all Iroquois ceremonies begin and end with a thanksgiving address, a paean to all the forces of earth, sky, and the sky world that create, support, and renew life. The address is divided into three main parts. The first part includes prayers of thanksgiving for the earth, waters, plants and trees, animals, birds, and the "three sisters" (the staple Iroquois foodstuffs—maize, beans, and squash). The second section gives thanks to those spirit forces that have greater power: wind, thunder, sun, moon, and stars. The final section gives thanks to the spiritual guides of the Iroquois: Handsome Lake, the creator, and the Four Beings (protectors of humans and messengers from the creator to Handsome Lake).

The epitome of the synthesis represented by the Longhouse religion is the Midwinter festival. Concentrated into its eight days are all of the major themes and components of Iroquois ceremonialism. The first half of the Midwinter rite is the older and contains many elements from the hunting-forest complex that centered on shamanic practices. It is given over to the symbolic expulsion of the old year through rites of confession, ashes-stirring, and dream fulfillment, as well as medicine-society curing ceremonies, False Face society rituals, and the White Dog sacrifice (no longer practiced). These expiatory and cathartic rituals clear the path for the new year and for the second half of the festival, whose structure largely reflects the farming-village complex. The "four sacred rituals"—a feather dance, a skin (or drum) dance, a personal chant, and a bowl game—are considered the gifts of the creator, modeled after ceremonies in the sky

world. A tobacco invocation, a kind of thanksgiving address, beseeches all of the spirit-forces to bless the people during the coming year. Both the Our Sustenance Dances and the performance by the Husk Faces anticipate a fruitful agricultural season. The yearly ceremonial cycle unfolds from the Midwinter festival and returns to it.

While the ceremonial cycle may vary slightly from longhouse to longhouse, a representative list would include the Midwinter festival, the Bush Dance, and the Thanks-to-the-Maple, Seed Planting, Strawberry, Raspberry, Green Bean, Thunder, Little Corn, Green Corn, and Harvest ceremonies.

MEDICINE SOCIETIES. Not only has Iroquois religion been concerned with affirming and intensifying life, it has also been concerned with countering those things that diminish life. The spirit-forces that assist humans in this battle revealed themselves long ago and entered into covenants with individuals, families, and societies. Through fasting, dream-visions, and ecstatic states, the ancient shamans sought to divine the causes of illness, pain, famine, and sudden or widespread death. Other shamanic specialists had their own ceremonies and skills that brought healing power. At times groups of shamans who possessed similar secrets joined together into sodalities. With the demise of individual shamanism, these “medicine societies” grew in importance in Iroquois life and became the preserver of the ancient shamanic traditions.

The significance of medicine society rituals in Iroquois life differs from that of the communal ceremonies. The latter are thanksgiving-celebrative, follow the agricultural cycle, are directed toward the major spirit-forces, and are held in the longhouse. The former are power-evocative and occasional, invoke the tutelary spirit of the particular medicine society, and are usually conducted in private homes. Membership in a society is generally limited to those who have been cured by one of that society’s rituals. The medicine societies have their own myths, songs, dances, prayers, costumes, and ritual paraphernalia. A listing of Iroquois medicine societies and their major characteristics follows.

1. *The Society of Medicine Men* (also known as Shake the Pumpkin) is the largest medicine society. Most members of the other societies also belong to it. The society began with a covenant relationship between the medicine animals and its founders. In return for feasts offered in their honor, the animals promised to cure diseases, ease pain, and get rid of bad luck. Practices of this society, such as juggling red-hot coals and wearing masks without eye holes, are quite ancient.

2. *The Company of Mystic Animals* includes the Buffalo, Otter, Bear, and Eagle societies. In varying degrees the members imitate their tutelary animals in their dances, songs, and practices. They continue the shamanic tradition in which humans and animals communicate with, and can be transformed into, one another.

3. *The Little Water Medicine society*, like its ally in the Eagle society, was originally associated with war and the healing of wounds received in war. The Iroquois say that its medicine,

concocted from parts of animals, birds, and plants, is the most potent made by any society. Ceremonies are held at night, several times a year, to renew the medicine.

4. *The Little People society* (also known as Dark Dance) also holds its ceremonies at night. This society fosters a good rapport with the *jo-ga-ob* (“little people”), elflike spirits who help humans in a variety of ways and who adopt many different forms for mischievous purposes.

5. *The False Face society* is the favorite of the Iroquois. The wooden masks worn by its members are filled with power. Reverence and ritual surround both their carving and their care. The most common practices of the Faces today were noted among the Huron by seventeenth-century observers: blowing ashes, handling hot coals, imitating hunchbacks, and carrying sticks. It is quite possible that the Faces came to the Iroquois from the Huron. The False Face society holds rites for cleansing the community of disease in the spring and fall. It sponsors rites at Midwinter both for its own members and for the broader community in the longhouse and performs individual curing rites when needed.

6. *The Husk Faces* are dedicated to the agricultural spirits. They also cure by blowing ashes and handling hot coals. During Midwinter they burst into the longhouse and announce that they are going to the other side of the world to till the crops.

7. *The Towii’sas society* is a woman’s society honoring corn, beans, and squash. It participates in the Green Corn ceremony and also has its own curing ceremonies.

8. *The Ohgiwe society* conducts ceremonies for people who have been dreaming of ghosts. A feast is held to feed the ghost and to dissuade it from bothering the living. Just as the sharing of food brings harmony into human relationships, so does it harmonize relations between living and dead. The Iroquois both respect and fear the dead and therefore conduct a number of feasts for them. In addition to the feasts conducted by the Ohgiwe society, there is a community Feast of the Dead (also called Ohgiwe) that is held annually or semiannually. All souls, but especially those of the recently deceased, are invited. Songs and dances are performed, and a post-midnight feast is held. There are also frequent family feasts for the dead during the winter months. These celebrations both fulfill the family’s obligations to the dead and serve as a means of bringing together relatives of the deceased.

THE INDIVIDUAL. In traditional (i.e., pre-nineteenth-century) Iroquois lore, access to the power and guidance of the spirit-forces was not limited to the community (through its collective ceremonial life) nor to the curing societies. The individual Iroquois had an array of spiritually vital allies, including charms, medicine bundles, guardian spirits, and his or her own soul.

The most common medium for communication with these forces was the dream-vision. During puberty rites of shamanic training a guardian spirit would reveal itself to the individual through the dream-vision. The spirit could take

the form of a human being, or animal, or a bird such as a raven or crow. An intimate and powerful relationship was established between the person and the guardian spirit. A person who had such a friendship had greater inner power and confidence than one who did not. The guardian spirit revealed its desires in dreams. To ignore this ally or to fail to understand its desires could result in illness. Such an illness signified a dangerous disruption of the relationship between spirit-forces and humans. Should someone become ill, his dreams would be consulted to ascertain what the guardian spirit desired. Sometimes the efforts of everyone in the community would be needed to fulfill the dream. They willingly undertook this.

Similarly, an alienation could occur between a person's ego and soul. The Iroquois believed that the soul was the source of biological as well as mental well-being. Dreams were its language. To lose touch with or deny the desires of the soul could cause it to revolt against the body. Dreams were carefully investigated in order to avoid such a possibility or to remedy it when illness occurred. The dream-guessing rite that even today forms a part of the Onondaga Midwinter festival was performed quite frequently by the seventeenth-century Huron. The ill person's soul's desire would be given in riddle form; whoever guessed it correctly had to fulfill the desire. This might involve an object, a feast, the performance of a particular ritual, or any of a number of other actions.

Dreams were also thought to contain warnings about future events—events whose actual occurrence might be prevented by acting out the dream and thereby fulfilling it. Thus, a warrior who dreamed that he had been captured, bound, and tortured by an enemy might, upon waking, ask his fellow tribesmen to tie him up and make cuts or burns in his flesh in order that the greater pain and shame predicted by the dream might be avoided. Dreams also affected hunting, fishing, military, and political plans.

There was no aspect of life among the ancient Iroquois and Huron that was not touched by the dream. Religiously it played both a conservative and an innovative role. That is, it confirmed within an individual's experience the culturally transmitted religious system while also initiating changes in the beliefs and rituals that constituted this system. It would not be going too far to say that most of Iroquois religion was constructed of dream material. Through this building process, the individual hierophany became symbolized and available to all. The last series of significant changes introduced into Iroquois life by the dream resulted from the revelations given to Handsome Lake, which were eventually institutionalized into the present-day Longhouse religion.

Today the majority of Iroquois live on reservations in Canada and New York State. Perhaps one-fourth of the approximately twenty thousand Iroquois adhere to the traditionalist Longhouse religion. In addition to the ceremonies described above, they perform partial recitations of the *Gai-wiio* ("good word") of Handsome Lake on the first mornings of both the Midwinter festival and the Green Corn ceremo-

ny. This formalization of the dream-vision revelations received by the prophet from 1799 until his death in 1815 provides the moral, ceremonial, social, and theological context in which followers of the Longhouse religion live. A complete recitation by an authorized preacher may occur every other fall at a meeting of the Six Nations, depending upon which longhouse is sponsoring the meeting.

BIBLIOGRAPHY

The main source for information on seventeenth-century Huron religion, which also provides some insight into Iroquois life, is *The Jesuit Relations and Allied Documents*, 39 vols. (1896–1901), edited by Reuben Gold Thwaites (New York, 1959). The nineteenth century marked the beginning of modern studies on Iroquois religion. Midcentury produced Lewis H. Morgan's classic *The League of the Ho-de-no-sau-nee, or Iroquois* (1851; reprint, New York, 1966). The most complete collection of Iroquois cosmological stories is found in J. N. B. Hewitt's "Iroquois Cosmology," which was published in two parts in the *Annual Report of the Bureau of American Ethnology* 21 (1899–1900) and 43 (1925–1926). An excellent, thorough study of the Midwinter festival is found in Elisabeth Tooker's *The Iroquois Ceremonial of Midwinter* (Syracuse, N.Y., 1970). For an introduction to and translation of a thanksgiving address, see Wallace L. Chafe's "Seneca Thanksgiving Rituals," *Bureau of American Ethnology Bulletin* 183 (1961). A much more thorough, if complex, comparison of several thanksgiving addresses along with a study of other events in the ritual cycle is M. K. Foster's *From the Earth to Beyond the Sky: An Ethnographic Approach to Four Longhouse Speech Events* (Ottawa, 1974). Valuable information on the medicine societies, along with the only full translation at present of "The Code of Handsome Lake" (i.e., the *Gaiwio*), is found in a collection of Arthur C. Parker's writings, entitled *Parker on the Iroquois*, edited by William N. Fenton (Syracuse, N.Y., 1968). Fenton has done this century's most important work among the Iroquois. Among his numerous articles, special mention should be made of "An Outline of Seneca Ceremonies at Coldspring Longhouse," *Yale University Publications in Anthropology* 9 (1936): 3–22; and "Masked Medicine Societies of the Iroquois," in the *Annual Report of the Smithsonian Institution* (Washington, D.C., 1940), pp. 397–430. An indispensable collection of articles on the Iroquois and their neighbors can be found in the *Handbook of North American Indians*, vol. 15, *Northeast* (Washington, D.C., 1978).

DONALD P. ST. JOHN (1987)

IRVING, EDWARD (1792–1834), was a controversial Scottish minister associated with the founding of the Catholic Apostolic church. Born in Annan, Dumfriesshire, Irving was educated at the University of Edinburgh. After serving as a schoolmaster at Haddington in 1810 and Kirkcaldy in 1812, he was licensed to preach in the Church of Scotland in 1815. He became Thomas Chalmers's assistant at Saint John's, Glasgow, in 1819 but left Scotland in 1822 to be-

come pastor of Caledonian Chapel, a small, struggling congregation in Hatton Garden, London. His dynamic preaching drew such large crowds that a new church had to be built at Regent Square in 1827.

Avowal of controversial doctrines soon undercut Irving's popularity. In the mid-1820s, Irving became a millenarian through the influence of James Hatley Frere, Henry Drummond, and Drummond's Albany Circle. He published *Babylon and Infidelity Foredoomed of God* (1826), in which he predicted the second coming of Christ in 1864; translated *The Coming of Messiah in Glory and Majesty* (1827), a millenarian work by the Spanish Jesuit Manuel Lacunza; lectured on the *Book of Revelation* at the University of Edinburgh (1828); and was a regular contributor to Drummond's prophetic journal *The Morning Watch* (1829–1833).

Citing his *The Doctrine of the Incarnation Opened* (1828) and *The Orthodox and Catholic Doctrine of Our Lord's Human Nature* (1830), the London Presbytery in 1830 charged Irving with teaching the sinfulness of Christ's human nature. He vigorously denied the charge, arguing that though Christ shared humanity's weak and infirm nature, his reliance on the Holy Spirit kept him without sin. Further, Irving refused to recognize the presbytery's authority.

Irving also believed in the continuation of the charisma of apostolic times and urged his congregation to pray for their outpouring. In the fall of 1831, glossolalia, faith healing, and prophetic visions broke out at Regent Square. As a result, Irving was deposed from the church in 1832 and excommunicated by his Scottish presbytery in 1833. He then became a wandering preacher, while several hundred of his London parishioners established the sacramental, millenarian, and charismatic Catholic Apostolic church. Eventually Irving was ordained a deacon in the new church, but he never assumed any significant leadership role. He died at Glasgow and was buried in the cathedral there.

Always the controversialist, Irving attacked the cold and somewhat complacent spirit of orthodoxy in the Church of Scotland. Through his adoption of millenarian and charismatic views, he became an early shaper of those movements in British and American evangelicalism.

BIBLIOGRAPHY

Irving's works are found in *The Collected Writings of Edward Irving*, 5 vols. (London, 1864–1865), edited by Gavin Carlyle. For studies of Irving's life, one may consult H. C. Whitley's *Blinded Eagle* (London, 1955), the work of an unabashed admirer, and Margaret Oliphant's *The Life of Edward Irving*, 2 vols. (London, 1862), a fine example of Victorian biography. A helpful examination of Irving's associations is Andrew L. Drummond's *Edward Irving and His Circle* (London, 1938). Irving's theology is analyzed in C. Gordon Strachan's *The Pentecostal Theology of Edward Irving* (London, 1973).

TIMOTHY P. WEBER (1987)

ISAAC, or, in Hebrew, Yitshaq; the second of the biblical patriarchs and the only son of Abraham and Sarah. Although not known from elsewhere, the name *Yitshaq* conforms to a well-known Northwest Semitic type and means "may God smile"; Ugaritic texts from the thirteenth century BCE refer to the benevolent smile of the Canaanite god El. The Bible, however, ascribes the laughter to Isaac's mother, who was amazed to learn that she would have a child despite her advanced age.

Isaac is the only patriarch whose name was not changed. The Bible treats him primarily as Abraham's son or the father of Jacob and Esau. He was the first ancestor of the Israelites to be circumcised on his eighth day in accordance with God's command (*Gn.* 17:12). At an unspecified age he was taken to be sacrificed in order to test Abraham's faithfulness; however, Isaac himself did little except ask why his father had not brought an animal for the offering. His later marriage to Rebecca, a cousin, was arranged by Abraham and provided comfort to Isaac after his mother's death. In his old age, Isaac was deceived into giving Jacob the blessing intended for the older Esau.

Isaac's only independent actions are found in *Genesis* 26, in which he tells King Abimelech that Rebecca is his sister, a story reminiscent of one told twice about Sarah and Abraham. The same chapter mentions his involvement in agricultural activities and his resolution of a dispute over water rights between his shepherds and those of Abimelech. Isaac died at the age of 180 and was buried alongside Rebecca at Machpelah.

Postbiblical Jewish interpretations focus largely on the story of Abraham's intended sacrifice of Isaac, called the *'aqedah* ("binding"), and often elaborate his role beyond the biblical description. According to one version he actually died and was then revived. Christian tradition, perhaps attested as early as the writings of Paul (*Rom.* 8:32), views this incident as prefiguring the Crucifixion. Paul contrasted Isaac, representing Christianity, with Ishmael, the rejected older son who symbolizes Judaism (*Gal.* 4:21–30).

An excellent survey of modern scholarly insights into the patriarchal narratives is Nahum M. Sarna's *Understanding Genesis* (New York, 1966). Rabbinic legends are collected in Louis Ginzberg's *The Legends of the Jews*, 2d ed., 2 vols., translated by Henrietta Szold and Paul Radin (Philadelphia, 2003). Shalom Spiegel's *The Last Trial*, translated by Judah Goldin (New York, 1967), summarizes a vast array of postbiblical legends pertaining to the binding of Isaac (*Gn.* 22).

FREDERICK E. GREENSPAHN (1987 AND 2005)

ISAAC THE SYRIAN (d. 700 CE?), also known as Isaac of Nineveh, was a bishop in the ancient Nestorian church of Syria; a monk, recluse mystic, and creative writer whose discourses have had widespread influence on Christian and,

some think, Sūfī spirituality. The English world at first greeted his work, originally written in Syriac, with culture-bound coolness, but has eventually come to recognize him as one of the most sublime and original mystic writers of the Christian East.

Little is known about Isaac's life. Born in a region around the Persian Gulf, he became a monk and for a time the bishop of Nineveh (modern Mosul), an office he resigned after only five months. He then withdrew to one of the monasteries in the mountains of Huzistan (southwestern Iran), where he practiced strict solitude (hesychasm) as a way of pursuing unceasing communion with God. In order not to break the rule of solitude, as Isaac himself relates in a stirring personal account, he refused to go to the deathbed of his brother, a monk in another monastery. Toward the end of his life a burning love led Isaac to write a profusion of illuminating discourses on Christian perfection—the fruit of his assiduous study of scripture, his reading of Christian authors, and his own experiences, about which he is discreetly modest.

Isaac's writings were translated into Greek, Coptic, and Arabic, and became influential from Byzantium to Ethiopia. Later Latin and Spanish translations made him known to the West. The Greek translation (ninth century) was printed in a partly critical edition by Nikēphoros Theotokēs (1770), and this edition was in turn the basis of a Russian translation by Feofan the Recluse (nineteenth century), excerpts of which were rendered into English by Eugénie Kadloubovsky and G. E. H. Palmer in *Early Fathers from the Philokalia* (1954). Earlier, A. J. Wensinck, working on Paul Bedjan's critical edition of the original Syriac discourses (1909), had published his English translation of *Mystic Treatises by Isaac of Nineveh* (1923), valuable but unfortunately inadequate in correctly rendering key patristic terminology derived from the Greek fathers. A new translation, *The Ascetical Homilies of St. Isaac the Syrian*, based on the Greek and Syriac, is in preparation by the Holy Transfiguration Monastery, Brookline, Massachusetts.

Only the earnest student will be rewarded by reading Isaac's work in English; wide cultural differences, the sublimity of Isaac's thought, and the fact that it is addressed principally to other solitaries, not ordinary Christians, add to other problems of translation. Although he cites Evagrius of Pontus, Theodore of Mopsuestia, and others who are in some respects suspect to orthodox theology, there is nothing specifically Nestorian about Isaac's Christology. Isaac strictly avoided dogmatic disputations and was completely grounded in the traditions of Eastern Christianity's piety and spirituality. He frequently quoted not only the Old and New Testaments but also the ascetics of Egypt and eminent church fathers such as Ephraem of Syria, Athanasius, Basil of Caesarea, Gregory the Theologian, and Chrysostom. Isaac was interested primarily not in mysticism but in God; his originality lies in his luminous descriptions of the deep stirrings of the Holy Spirit in the heart, the new birth, the gift

of tears, and profound stages of prayer leading to ecstasy. For him the goal of Christian perfection is the love of God, of "the food of angels . . . which is Jesus."

THEODORE STYLIANOPOULOS (1987)

ISAIAH (fl. 740–701 BCE), or, in Hebrew, Yesha'yahu or Yesha'yah, was a Hebrew prophet. Isaiah, son of Amoz, prophesied during the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah (see *Is.* 1:1). He was a contemporary of the prophets Micah and Hosea and lived soon after Amos. (Amos and Hosea were active in Israel, or Ephraim, while Micah prophesied in Judah.) This was the period of the Syro-Ephraimite war (734/3–733/2 BCE), in which these kingdoms to the north of Judah surrounded Jerusalem, threatening to replace the house of David (*Is.* 7:1–6 [verse citations are according to the English version]). It was also the time of the Assyrian invasions, a chain of military campaigns that caused the fall of the northern kingdom of Israel in 722 and made Judah a vassal of the Assyrian Empire. During this stormy political period, Isaiah addressed the political elite and the people of Jerusalem, delivering God's word, which often did not correspond with the rulers' political views. He repeatedly criticized the rulers for the prevailing social injustices.

COMPOSITE NATURE OF THE BOOK OF ISAIAH. *Isaiah* contains sixty-six chapters and is the largest prophetic book in the Hebrew Bible. The existing structure had appeared by the beginning of the second century BCE. *Ben Sira* apparently knows *Isaiah* as a whole (*Sir.* 48:17–25), and the Dead Sea Scrolls, as well as the New Testament, regard the entire sixty-six chapters as a single composition. There are, indeed, certain stylistic usages that are common to the entire book, such as the combination "Holy of Israel" (*Is.* 1:4, 5:16, 5:19, 5:24, 6:3, 10:20, 12:6, 30:11, 30:12, 30:15, 31:1, 41:14, 41:16, 41:20, 43:3, 43:14, 45:11, 47:4, 48:17, 49:7, 54:5, 55:5, 60:9, 60:14) and the expression "Thus says God," in the imperfect tense instead of the usual perfect, "said" (*Is.* 1:11, 1:18, 33:10, 41:21, 66:9; cf. 40:1, 40:25).

Contrary to these early sources, however, modern scholarship on *Isaiah* generally differentiates between chapters 1–39 of the book and chapters 40–66, treating them as distinct major works by different authors. The first 39 chapters of *Isaiah* bear the title "The Vision of Isaiah the Son of Amoz" (1:1); chapters 40–66 are ascribed to an anonymous

prophet to whom scholars refer as “Second Isaiah,” or “Deutero-Isaiah.” Some scholars also recognize the existence of a “Third Isaiah,” or “Trito-Isaiah,” the author of chapters 56–66, because the tone and approach of these chapters is more critical and condemning than that of chapters 40–55.

The division of the *Book of Isaiah* into two sections follows from the fact that the two parts are concerned with two distinct historical periods, the Assyrian and the Persian, and different political situations during these periods, which are reflected in the different topics and particular prophetic themes of the book. The author of the first part is concerned with social problems and concentrates on the moral and ethical misconduct of the rulers of Jerusalem, while the author of the second part responds to the national religious crisis of the exiled Jewish community in Babylonia. Accordingly, speeches of judgment distinguish the first part, while words of encouragement and oracles of salvation characterize the second. The prophet of the second part anticipates the collapse of Babylon in 539 BCE and the triumph of Cyrus II (558–529), the founder of the great Persian Empire. He knows about the destruction of the Temple in Jerusalem (587/6 BCE), and assigns Cyrus the task of building the new temple (*Is.* 44:28, 45:1; cf. 52:5, 52:11). Historical evidence thus dates the second part of *Isaiah* to the second half of the sixth century BCE, approximately two centuries later than the first part. The division in *Isaiah* was already recognized in the twelfth century CE by the Hebrew commentator Avraham ibn ‘Ezra (in his commentary on *Is.* 40:1), and the literary-thematic distinction has recently been confirmed by a computer analysis (Y. T. Radday, *The Unity of Isaiah in Light of Statistical Linguistics*, Hildesheim, 1973).

But how were these distinct compositions tied together? One can only speculate. Perhaps it was just a technical matter in which a shorter scroll was attached to a longer one for preservation, and the origin of the work as two separate manuscripts was later forgotten. Or perhaps the combination was intentional, the product of a school of religious thought that sought to create a continuous ideological composition in which the period of judgment had been fulfilled, thus confirming the old Isaian prophecies and pointing out the validity of the new ones concerning the new era of salvation. Or perhaps the composer of the second book considered himself Isaiah’s faithful disciple. This hypothesis may explain the lack of superscription in the second part as well as the similarity of idioms and phrases in the two parts. For example, in a rare passage in which Second Isaiah refers to himself, he describes God’s word as *limmudim*, “teaching” (*Is.* 50:4), language that resembles that of Isaiah (*Is.* 8:16). Isaiah’s spiritual disciple responds to his teacher’s feeling of “distress and darkness” (*Is.* 8:22), which caused the master to seal his testimony (*Is.* 8:16–17). The disciple feels that times have changed. He notices that God again reveals himself (*Is.* 40:5), and he considers himself the one who bears the leader’s testimony.

THE FIRST ISAIAH. It appears that Isaiah, the son of Amoz, was from Jerusalem (unlike his contemporary Micah, who

grew up outside the city). He was familiar with city life (see, e.g., *Is.* 3:16–23), and Jerusalem was the center of his activity. He married a woman whom he called “the prophetess” (*Is.* 8:3). They had at least two sons, whose names are associated with their father’s prophetic message (cf. *Hos.* 1:3–9): Shearjashub (lit., *She’ar yashuv*, “a remnant shall return”; *Is.* 7:3) and Maher-shalal-hash-baz (lit., “pillage hastens, looting speeds”; 8:3). Isaiah may have had a third son, ‘Immanu’el (“God is with us”; 7:14; cf. 8:18), whose name refers to trust in God even in moments of political despair. Isaiah is rarely mentioned outside of his book, but is referred to in *2 Kings* 19–20 and *2 Chronicles* 26:22, 32:20, and 32:32, where he appears not just as a prophet but as the king’s healer and the court chronicler. All the sources indicate that Isaiah was closely associated with King Hezekiah, especially during the Assyrian siege of Jerusalem. He had access to the king (*Is.* 7:1ff.) and was the king’s political counselor (37:1ff.). He makes frequent reference to the forms and vocabulary of the wisdom literature and is clearly familiar with the scribal profession (30:8; cf. *2 Chr.* 26:22).

There are a number of traditions about Isaiah’s role and activities that make it difficult to reconstruct the “real” Isaiah. His close ties with Hezekiah as portrayed in the narrative (*Is.* 36–39, *2 Kgs.* 19–20) may create the impression that he functioned as a court prophet, but his confrontation with King Ahaz (*Is.* 7) depicts him as an independent prophetic figure. The portrayal of Isaiah as a healer in *Kings* 20:1–7 is significant—“And Isaiah said: bring a cake of figs. And let them take and lay it on the boil, that he may recover” (*2 Kgs.* 20:7)—and is repeated in the appendix of the *Book of Isaiah* (*Is.* 38:1–8). That *Isaiah* inserts this deed of healing at the end of Hezekiah’s poem as an excursus may reflect a tendency to minimize Isaiah’s role as a healer and portray him instead in the role of God’s messenger, who does not perform miracles in the tradition of the earlier prophets (such as that of Elisha, described in *2 Kgs.* 2–5). Note, however, that even in chapters 1–35, which deal directly with Isaiah’s prophecy, the prophet does not appear only as God’s messenger but performs symbolic acts in the tradition of the earlier prophets, such as Elijah. For example, he walks barefoot and naked in Jerusalem for three years as a symbol of the fate that would overtake Egypt and its ally Ethiopia at the hands of Assyria (*Is.* 20:1–6). One must keep in mind, however, that this is but a single episode.

Speeches and additional material. The major critical issue surrounding the book of Isaiah is the determination of his original speeches. It has been noted that even chapters 1–39 do not constitute a single composition. The poetic, oratorical language is replaced in chapters 36–39 with a historical narrative (as well as Hezekiah’s prayer in 38:10–20). The *Book of Isaiah* seems to have a long literary history. Rabbinic sources hint at an editorial process in which it was not Isaiah himself who wrote the book but later scribes (Hezekiah and his school). Modern criticism attempts to establish clear criteria for the distinction between the authentic and the

added material. Some scholars distinguish between oracles of judgment and prophecies of salvation, with the latter, reflecting the days to come, considered a later theological addition. Style is another criterion for analyzing the editorial process. Isaiah is regarded as a poet. Thus some hold that only the material in verse is authentic. Accordingly, passages such as 1:18–20, which breaks the poetic structure, and 4:2–6, a prosaic text differing from the poetic material surrounding it, are considered late. Similarly, this view does not regard texts such as 2:2–4/5 and 11:1ff., which are prophecies of salvation, as Isaiah's compositions. It has also been suggested that verses referring to the fall of Assyria (e.g., 8:9–10, 10:16–19, 10:20–23, 10:24–27, 10:33–34) are the product of an "Assyrian redaction" added in the period of Josiah's territorial expansions and Assyrian decline, toward the end of the seventh century BCE. The goal of the redactor, in this view, was to update Isaiah's original prophecy and show how it was fulfilled through God's determination of political events. Thus there is a complete theological paradigm: First God appears as the accuser and punisher of Israel, and later he reveals himself as Israel's savior. Scholars of the redactional school such as Barth, Clements, and Kaiser assume that Isaiah was not a prophet with a complete political vision, but merely a deliverer of judgmental oracles.

It is the opinion of this author, on the other hand, that Isaiah had a politico-religious worldview that was not limited to contemporary conditions. As a man of vision, he had a total religious concept which looked beyond the day of judgment which was imminent. Isaiah was not just a social critic and man of protest; his proclamation of judgment led to his prophetic outlook for the future as well. There is neither stylistic nor philological evidence that the oracles designed for the days to come (included in chapters 1–35) are products of later hands, unless one imposes on the text specific external critical theories (for certain exceptions, see below). Rather than regarding style (verse versus prose) as the criterion for distinguishing between the original and added text, one should consider that stylistic variations and mixing of styles may be the function of the subject matter and may have been intentional in a particular prophetic message. Subject and function determine Isaiah's style; the question of how it has been said is related to the issue of what has been said. Isaiah employs a significant variety of stylistic forms: *mashal* ("parable"; 5:1ff.), comparison (1:2–3), vivid description (1:4–9), polemic discourse (1:10–17), lament (1:21), satire (3:4ff.), vision (6:1ff.), prediction (7:7–9), and narrative (7:11ff., 8:1ff.), among many others.

The rich language and varied stylistic modes reveal that the prophet was not a narrator who merely reported events. Isaiah sought to appeal to his audience by the force of his language, a goal that, in light of the prophetic office, requires the use of religious language. This language uses metaphor and an imaginative style to create an array of sensory impressions. For example, the description of the foreign influence in Judah is hyperbolic: "Their land is filled with silver and

gold, and there is no end to their treasures; their land is filled with horses, and there is no end to their chariots" (2:7). The prophet's stylistic technique creates a vivid and dynamic word picture. The poem of the vineyard in 5:1ff. aims to illustrate a specific aspect of the people's misconduct. The use of a parable, that is, the rhetorical description of the situation in a different context, enables Isaiah to focus his audience's attention and get their sympathy. If he had presented his criticism directly, it might have been rejected by the hostile audience. Another illustration of this technique is the vision of the future in 4:2–6, written in a prose style and following the description, in vivid imagery, of the corrupted daughters of Zion (3:16ff.). The present reality is described in verse in order to stir the emotions and move the audience. However, in this context if a description of the future were delivered in verse, it might have been received as an imaginative discourse having nothing to do with the present reality. Isaiah therefore employs a prosaic style, the language of historical fact, and the address, though it refers to the days to come, seems to have an air of reality.

Chronological order of the speeches. The speeches of chapters 2–5 (as well as those of 1:21–31) differ thematically from the material of 7:1ff., and it has been suggested that each topic mirrors a different political era. The sharp social criticism is replaced by political addresses. The first cycle of speeches (chaps. 2–5) is assigned to the days of Uzziah (c. 787–c. 736), a time of political stability, security, and economic prosperity (see *2 Kgs.* 15:1–7, *2 Chr.* 26:1–23). The social and political elite of Jerusalem regained their strength, creating severe social tension in Judah that affected the poor. Isaiah criticizes the rulers for oppressing their citizens. The speech of 7:1ff. refers to the days of Ahaz (who became king probably in 741 and was coregent until 725), during the Syro-Ephraimite war. Here Isaiah is responding to political developments rather than to the domestic situation. This historical reconstruction of Isaiah's activity assumes, however, that 1:4–9, which describes a major war that has endangered Jerusalem, is either not in order or that the whole of the chapter is an introduction to Isaiah's prophecy and does not belong to his early activity in the days of Uzziah. However, if one does not ignore 1:4–9 and read chapters 1–5 chronologically in their existing order, they reflect a period of war that had gravely threatened Jerusalem. Isaiah is concerned here with the cause of the military disaster. He indicates that corrupt domestic conditions are the reason for the political and military defeat and the people's suffering, which are God's punishment. In chapters 7–8 however, he focuses on King Ahaz's foreign policy. Isaiah's major thrust is directed not toward Uzziah's time but Ahaz's.

Isaiah's prophecy is thus a series of responses to specific political and domestic situations that, in his view, are mutually related. He reveals his deep involvement with and specific viewpoint regarding these political events and offers his unique prophetic interpretation of the political situation through a series of speeches that attempt to persuade. Isaiah

does not speak as a political analyst or as a political philosopher; he uses rhetoric or any other means of appeal to reach his audience (see, e.g., 7:10ff.). Accordingly, the various speeches must be analyzed as a whole, and each speech or vision studied in light of Isaiah's thematic prophetic ideology and not as a separate entity. Prophecies of salvation follow from oracles of judgment, and both are integrated into Isaiah's prophetic worldview.

Political context and arrangement of the speeches.

The book deals with two major political events that shocked Judah: the Syro-Ephraimite war and the Assyrian threats (734–701). Isaiah's prophecy is presented in light of his overall prophetic conception, which does not see the actual events as mere politico-military developments, although they shaped the prophet's political views. In the Syro-Ephraimite war the kings of Aram (Syria) and Ephraim (Israel) sought to fight against Assyria and needed Judah's active support. Ahaz, the Judahite king, refused, and as a result the northern coalition launched a military attack meant to replace Ahaz with their favorite, who was not a descendant of the house of David (see *Is.* 7:1–6). God's sacred promise to David and his house of an eternal throne in Jerusalem (see *2 Sm.* 7:1–17) was thus endangered. The sacred status of the house of David is the starting point of Isaiah's prophetic responses. It forces him to deal with the cause of the problem, which was, in his view, the social and ethical misconduct of the rulers (see 1:4–5, 1:10–17, 1:21–23, 3:14–15, 3:16ff., 5:1ff.). The war is God's punishment (see 1:4–9). At the last moment (1:9) the city will be purified, and justice will be restored (1:25–27, 2:2–4/5, 4:2–6; hence the above-mentioned connotation of the name of Isaiah's son Shear-jashub, "a remnant shall return." This teleology, the faith that God will interfere on behalf of the people and for the sake of Jerusalem, leads Isaiah to oppose Ahaz's political attempts at saving himself by means of the foreign powers of Assyria or Egypt (7:18–25), and to assure the king that the enemies of the north will collapse (7:5–9). Furthermore, a series of speeches delivered by Isaiah emphasize the continuity of the Davidic dynasty (9:1–6, 11:1ff.). Chapters 10–11 should be read with the implications of the Assyrian threat in mind. Aram and Ephraim, Judah's enemies, had collapsed, and Judah itself was powerless against Assyria. The new political development invited the prophet's interpretation, and Isaiah delivers a series of speeches that interpret the meaning of the situation. Again, he points to moral and ethical misconduct as the cause of the military threat (10:1–4). God's response is direct: Assyria is his means of punishment (10:5–6), but that empire overestimates its power and will be punished (10:7ff.).

It has been suggested that the collection of oracles against the nations in chapters 13–23 may include material that is not Isaian (particularly chapters 13–14 and perhaps also chap. 23). The collection, which includes a prophecy against Judah concluding with a personal attack on two officers (22:1ff.), is an integral part of Isaiah's prophetic ideolo-

gy. The structure of this collection resembles the work of Amos, who starts with a series of oracles against the nations and climaxes with a prophecy against Israel (1:2–2:16), his major point. The common theme in Isaiah's prophecies against the nations is that they will suffer military defeat. Isaiah repeatedly reveals his basic religious and political belief that the international political situation does not exist in a vacuum but is determined by God, who does not exclude Judah. Consequently, Judah's efforts to protect itself through military and political means will fail (22:1ff.).

The visions of chapters 24–35 abstractly summarize once again Isaiah's prophetic ideology: God's absolute universal domination and his punishment for misbehavior in the form of military defeat (24:1–5, 24:21–23, 28:14–22, 29:13–14, 30:1–3, 34:1ff.). Isaiah, a master of language, moves from visionary to more concrete speech and characteristically, concludes with an optimistic vision of the future (35:1ff.). It is unnecessary, therefore, to regard chapters 34–35, with their enthusiastic tone, as part of Second Isaiah's prophecy, as a number of scholars suggest.

Such a thematic reading of Isaiah's speeches raises the question of the place and function of chapter 6, which is regarded by many as Isaiah's call, his "inaugural vision." Was it originally placed at the beginning of the book? If so, why would the message of the vision be to harden the hearts of the people (6:9, 6:10)? Perhaps this is, in fact, a response to the people's stubbornness and their denial of Isaiah's earlier comments on their political and military troubles. In this light the vision of chapter 6 would seem to be in its correct chronological setting, reflecting Isaiah's despair over the people's unresponsiveness.

Alternatively, those who read *Isaiah* as a series of discrete speeches of judgment have suggested that the book's editors intended its literary structure to reflect a specific theological view that incorporated the late prophecies of salvation. For example, the literary passage 5:25–30 may be read together with a group of invective threats in 9:8–21, and the *hoy* ("woe") oracle of 10:1–4 may be associated with a series of *hoy* oracles in 5:8–24. It has been suggested as well that these two series of threats and *hoy* oracles were broken apart and rearranged in a chiasmic order. The intent was to frame Isaiah's actual encounter with Ahaz in a way that would recall the fall of Israel and would also warn seventh-century Judah (the time of Josiah) by recalling the realization of Isaiah's words. Thus, in this view, the prophecies were rearranged, and the book was edited in light of the political climate of Josiah's times.

"SECOND ISAIAH." The Babylonians exiled the social and political elite of Judah (see *2 Kgs.* 24:12–26, *Jer.* 52:16–30) to Babylonia. Evidence suggests that many of the Jews in exile preserved their national and religious identity. The Sabbath emerged as the expression of the covenant between God and the Jewish people, a view that has distinguished the Jews since the exilic period (see *Is.* 56, 58:13–14). The exilic period is also noted for its nationalistic-religious literary activity.

The masterpiece of biblical historiography, the Deuteronomist work, was developed and shaped in this period. Nevertheless, there was a feeling of despair in the exiled Jewish community. The prophet Ezekiel asked hopelessly, "How are we to go on living?" (*Ez.* 33:10; see also 37:11). *Lamentations* repeatedly conveys a feeling of pessimism: "There is no one to comfort me" (*Lam.* 1:2, 1:16, 1:17, 1:21). Psalm 137 also reflects a hopeless situation, and Second Isaiah himself struggles with an attitude of religious and national despair: "A voice says: 'cry!' And I said: 'What shall I cry?' All flesh is grass and all its beauty is like the flower of the field" (*Is.* 40:6; RSV). The people felt the fall of Jerusalem, the destruction of the Temple in 587/6 BCE, and then the exile to be a hopeless situation that resulted from God's disappearance from the political stage. The exiles were indifferent to the momentous developments that were occurring on the international scene. The sensational victories of Cyrus I, king of Persia, did not affect the pessimistic religious attitude of the Jewish community in Babylonia. In 539 BCE, however, Babylonia surrendered to Cyrus II, and in 538 Cyrus announced his famous declaration allowing the Jewish community in exile to return to Jerusalem and restore the Temple (*Ezr.* 1:3–5 [2 *Chr.* 36:23], 6:3–5).

An important issue in the interpretation of Second Isaiah's prophecy is thus whether he addressed the exiles before or after the fall of Babylonia. Cyrus's edict is not quoted in Second Isaiah's speeches, and in light of his struggle with his audience's skepticism about God's control of contemporary political events, the speeches would sound inappropriate if Cyrus had already publicly granted permission to rebuild the Temple in Jerusalem. One should also take into account that Second Isaiah's description of the fall of Babylonia is not realistic. In contrast to inscriptions that report that the city fell peacefully, Second Isaiah describes Marduk, Babylon's god, being carried into captivity (46:1–2), which suggests that the prophet prophesied prior to 539 BCE.

The unknown prophet, the so-called Second Isaiah, was aroused by these significant political developments and considered that his prophetic goal was to persuade the exilic community that the immediate future held great promise and new hope. He considered the great king, Cyrus II, to be an agent of God, "who says of Cyrus: 'He is my shepherd. And he shall fulfill all my purpose,' saying of Jerusalem; 'she shall be built,' and of the Temple, 'your foundation shall be laid'" (44:28; see also 45:12–13). He rejected the spiritual crisis of the exiles and proclaimed two major themes: that God is not hidden from the Jewish people and that God is directing the new political events on their behalf. But first, Second Isaiah had to struggle with and reject the basis of the religious crisis. The cry "there is no one to comfort me" (*Lam.* 1:21) was replaced with "Comfort, comfort my people, says your God" (*Is.* 40:1). Furthermore, there was no reason for the people's feeling of guilt that they suffered because of their forefathers' sins; a new spiritual and religious era has begun: Jerusalem's warfare has ended and she has been par-

doned (40:12). This explains the absence of threat, so characteristic of the biblical prophets, in Second Isaiah's speeches and sheds light on his style. His aim was to persuade, to appeal to his audience through words of comfort and encouragement, not by means of threat and judgment.

The major issue in research on Second Isaiah is the demarcation of the prophetic speech. There are almost no formal indications of the beginning or end of the address. In general, two opposite approaches have been taken. The first considers the book to be a product of planned literary activity and regards Second Isaiah's work as composed of large units. The second approach argues that Second Isaiah delivered his speeches orally, and that the book is a collection of a number of short, distinct oracles. This approach raises the issue of the arrangement of the material and the editorial principles behind it. It has been suggested that the short, independent oracles were arranged mechanically according to a principle of keywords or similarity of theme, with each speech placed on the basis of its association with the preceding unit. One should note, however, that the question of defining the individual speech depends on the function of Second Isaiah's prophecy, which was to change his audience's religious attitude. He thus appealed to his audience by employing numerous means of persuasion; he thus relies on argument and style. Second Isaiah paid close attention to the organization of his addresses; each emerged from and is a response to a particular situation. An analysis of the text in light of the prophet's rhetorical goal and his efforts to affect his listeners reveals that his speeches are not short thematic oracles but are relatively long, thus enabling him to develop his argument at some length.

Second Isaiah was a master of language and employed his skill to stress his point and attract the attention of his audience. He often repeats himself to emphasize a certain point. On the other hand, he often varies his style by using a colorful and rich vocabulary to create an aesthetic effect. He is very flexible in his use of language and often employs unusual words or phrases with the intention of providing variety and avoiding clichés.

The beginning of Second Isaiah's prophecy, 40:1–2ff., is a good illustration of his style. His first announcement, "Comfort, comfort my people" is brief and clear. The entire section, verses 1–2, is explicit in structure, with no coloration or figures of speech, and is designed to express clearly and straightforwardly his primary announcement. But the audience may miss a message delivered in such an unadorned style. Therefore, Second Isaiah uses the stylistic device of repetition and repeats the key word of his message, *comfort*. The reiteration of the word is intended to make a deep impression on the audience. The verb *comfort* in the form used here was coined by Second Isaiah based upon the lament "no one comforts her" (*Lam.* 1:2). Yet Second Isaiah uses it in a positive sense, to stress the motif of rejoicing, while in *Lamentations* the expression connotes religious despair. Thus at the beginning of his address, Second Isaiah employs a familiar

expression in a way that changes its meaning. By using a familiar expression in an unexpected manner, he attracts attention and also cancels its earlier, negative meaning. In addition, verse 1 reverses the normal order and places the opening formula, “says your God,” at the end. Because Second Isaiah wants to convey his message’s immediacy, he has adjusted the formula accordingly. In addition, as is well known, rhyme is not highly developed in biblical prosody. In order to unify the various elements in a verse, the biblical poets developed the literary device of the sound effect. Sound plays an important role in this verse. *Alliteration* holds the verse together and focuses attention on the consonant *heit(h)* in the opening words “*nahamu, nahamu.*” The sound is then repeated at the end of verse 2 (*ḥaṭṭo’teikhah*) thus binding the entire statement into a whole.

The songs of the “servant of the Lord [‘eved YHVH]” have received special attention from scholars. There are four poems that speak about the servant (42:1–4, 42:5–7, 49:1–6, 50:4–9) and an additional two poems that may be related to them (50:10–11, and 52:13–53:12). These poems share a common theme: Their subject, the servant, suffers when he is ignored by the people who surround him. In the future, however, the servant will be recognized as God’s servant, who has a mission to restore justice, which will be fulfilled. The poems occupy a distinct place in the history of sacred interpretations and have theological significance in the histories of Jewish and Christian religious interpretation. The major critical issue for Second Isaiah is whether to isolate the poems from their context or to consider them as an integral part of his prophecy. There is the further question of the identity of the servant, with scholars divided between an individual and a collective identity. Thus there have been various attempts to identify the servant as a specific public or historical figure, such as Jeremiah, Josiah, Zerrubbabel, or even the prophet himself. Second Isaiah makes other allusions to the servant of God, however (41:8ff., 41:13, 42:19, 44:1–2); and in light of the frequent references to Israel as God’s servant (see, e.g., 49:3), it has been suggested that the servant be seen as the people of Israel, sympathetically portrayed by Second Isaiah to arouse hope and a feeling of mission and fulfillment as well as to convey the message that the current suffering has not gone unnoticed. Another view holds that the servant is neither a particular figure nor a group, but the combination of a mythological cultic and royal figure.

“THIRD ISAIAH.” Concerning chapters 56–66, it has already been mentioned that these may constitute a separate collection by another anonymous prophet, called Third Isaiah, or Trito-Isaiah, who was active after Second Isaiah, during the time of Ezra and Nehemiah, in the fifth century BCE. Third Isaiah is no longer located in Babylonia but is based in Judah. His prophecies presuppose the existence of the Temple in Jerusalem (which was dedicated in 515). There is no clear thematic line in this work as is found in the speeches of Second Isaiah. The collection of Third Isaiah emphasizes ritual requirements. It starts with words of encouragement to those who observe the Sabbath, including the eunuchs, and stresses

the importance of Sabbath worship (56:1–8). It continues with a critique of the leaders (56:9–12), a short lament on the death of the righteous (57:1–2), a stormy attack on foreign cults (57:3–13), a prophecy of comfort (57:14–19), and a criticism of those who fast ritually without thought (58:1–7). Chapters 60–61 contain another prophecy of salvation in the style of Second Isaiah. In 63:7–64:11 there is a communal lament, and 66:1–4 rejects both the building of the Temple and the sacrificial cult. This attitude reflects a view opposite that held by the prophets Haggai and Zechariah, who encouraged and supported the rebuilding of the Temple. It has been suggested that Third Isaiah was a disciple of Second Isaiah and his redactor as well. Another view holds that Second Isaiah returned to Jerusalem following Cyrus’s edict and continued his prophetic activity there. His prophecies in Judah would then constitute chapters 49–66, in which Zion is the background for the speeches (see 49:14ff., 51:17–23, 54:1ff., 60:1ff., 62:1–9).

TEXTS OF ISAIAH FOUND AT QUMRAN. The scrolls found in 1947 on the northwestern shore of the Dead Sea reveal two almost complete manuscripts of the entire *Book of Isaiah*, dated to the second or first century BCE. As a rule, the scrolls of *Isaiah* reflect the Masoretic text. Of the two scrolls, one (found in Cave I) shows certain corrections and interlineations from a more popular edition, but these are mainly matters of spelling and stylistic characteristics rather than important editing. This scroll shows indications that it may actually have been composed of two manuscripts: There is evidence that the existing chapter 34 was started on a new sheet of leather, which may mean that it was a new manuscript. This may have influenced the modern critical division of the book into Isaiah of Jerusalem and Second Isaiah (and the remainder of the book).

YEHOSHUA GITAY (1987)
Revised Bibliography

ISHIDA BAIGAN (1685–1744) was a Japanese philosopher of the Tokugawa period (1603–1868) who developed the concept of a moral or ethical philosophy known as Shingaku. Ishida was born on September 15, 1685, in the village of Tōge in Tamba province (modern Kameoka City, Kyoto prefecture), the second son of a farmer. At the age of ten (eleven by Japanese count) he was sent to Kyoto as a merchant's apprentice. There he spent his leisure time studying Shintō doctrine and attending lectures by local Confucian scholars, Buddhist monks, and experts on the Japanese classics.

When Ishida reached the age of about thirty-five he began to feel an inner restlessness; he felt that he did not know the nature of human beings. In his search for a guide or a direction, he met a Buddhist monk, Ryōun, who led him to an awakening of the spirit such as that described by the Chinese founder of Daoism, Laozi. It was then that Ishida realized that humanity's true nature was egoless. In his writings, he pointed out that once one understood this aspect of human nature, one's life would automatically coincide with what he called the "universal principle" and one's *kokoro* ("soul" or "spirit") would be content and at peace. Ishida believed it would be possible to reach an egoless, natural state and to acquire instinctive knowledge by meditative restraint of the senses. In accordance with his convictions, he lived as a celibate ascetic, although he acknowledged that social responsibilities were also inherent in his view of human nature.

In 1727 Ishida left the service of the Kyoto merchant; two years later, he began to conduct lectures at his home in Kyoto. At these lectures, which were free and open to all, Ishida encouraged his listeners to seek individual awakening through meditation. To make learning accessible to all, Ishi-

da distributed simplified manuscripts of his interpretations of Chinese and Japanese classical literature. He repudiated the critiques of scholars, whom he believed were interested only in the meanings of words. Ishida strove instead to capture the essence of the classics as he understood them, although his views did not always agree with the original intent of the authors.

In his search for a fundamental principle, Ishida believed that the first and last step in the learning process was to understand the human heart and thereby gain insight into human nature. He adopted the term *jinsi*, which refers to the total capacity of the mind, from the Chinese Confucian thinker Mengzi. According to Ishida, one must utilize all one's spiritual and mental capacity to overcome desires. Only when one's *kokoro* is empty and free of human desires is it possible to unite with the universal spirit. Overcoming the ego and its desires will enable one to carry out one's duty in life. One can then develop a spirit of self-sacrifice toward one's ruler, be properly filial toward one's parents, and discover one's proper vocation in life.

BIBLIOGRAPHY

A number of works have been published on Ishida Baigan and his philosophy of Shingaku, or practical ethics. Robert Bellah's *Tokugawa Religion: The Values of Pre-Industrial Japan* (Glencoe, Ill., 1957) clarifies the religious morals of the Tokugawa period, morals that had their origin in Ishida's concept of ethics and that played a part in the modernization of Japan. Readers of Japanese will want to consult a translation of this seminal work, *Nihon kindaiika to shūkyō rinri* (Tokyo, 1981), translated by Hōri Ichirō and Ikeda Akira. Ishikawa Ken's *Shingaku, Edo no shomin tetsugaku* (Tokyo, 1964) discusses Ishida's philosophy and its applicability to the common people. Sakasai Takahito focuses on Ishida's conversion to popular morality in "Sekimon shingaku no igi to genkai, sono tsūzoku dōtoku e no tenraku ni tsuite," *Rikkyō keizaigaku kenkyū* 18 (February 1965). Another work that deals with Ishida's ethics is *Sekimon shingaku*, edited by Shibata Minoru (Tokyo, 1971), in volume 42 of "Nihon shisō taikai." Finally, Takenaka Yasukazu's *Sekimon shingaku no keizai shisō* (Tokyo, 1962) emphasizes the economic aspects of Ishida's ethical philosophy.

HAGA NOBORU (1987)
Translated from Japanese by Irene M. Kunii
Revised Bibliography

ISHMAEL, or, in Hebrew, Yishma'el; eldest son of Abraham. Ishmael's mother was Hagar, an Egyptian slave girl whom Sarah gave to Abraham because of her own infertility; in accordance with Mesopotamian law, the offspring of such a union would be credited to Sarah (*Gn.* 16:2). The name *Yishma'el* is known from various ancient Semitic cultures and means "God has hearkened," suggesting that a child so named was regarded as the fulfillment of a divine promise.

Ishmael was circumcised at the age of thirteen by Abraham and expelled with his mother at the instigation of Sarah, who wanted to ensure that Isaac would be Abraham's heir (*Gn.* 21). In the New Testament, Paul uses this incident to symbolize the relationship between Judaism, the older but now rejected tradition, and Christianity (*Gal.* 4:21–31).

In the *Genesis* account, God blessed Ishmael, promising that he would be the founder of a great nation and a “wild ass of a man” always at odds with others (*Gn.* 16:12). He is credited with twelve sons, described as “princes according to their tribes” (*Gn.* 25:16), representing perhaps an ancient confederacy. The Ishmaelites, vagrant traders closely related to the Midianites, were apparently regarded as his descendants. The fact that Ishmael's wife and mother are both said to have been Egyptian suggests close ties between the Ishmaelites and Egypt. According to *Genesis* 25:17, Ishmael lived to the age of 137.

Islamic tradition tends to ascribe a larger role to Ishmael than does the Bible. He is considered a prophet and, according to certain theologians, the offspring whom Abraham was commanded to sacrifice (although *sūrah* 37:99–111 of the Qurʾān never names that son). Like his father Abraham, Ishmael too played an important role in making Mecca a religious center (2:127–129). Judaism has generally regarded him as wicked, although repentance is also ascribed to him. According to some rabbinic traditions, his two wives were Aisha and Fatima, whose names are the same as those of Muḥammad's wife and daughter. Both Judaism and Islam see him as the ancestor of Arab peoples.

A survey of the Bible's patriarchal narratives can be found in Nahum M. Sarna's *Understanding Genesis* (New York, 1966). Postbiblical traditions, with reference to Christian and Islamic views, are collected in Louis Ginzberg's exhaustive *Legends of the Jews*, 2d ed., 2 vols., translated by Henrietta Szold and Paul Radin (Philadelphia, 2003).

FREDERICK E. GREENSPAHN (1987 AND 2005)

ISHMAEL BEN ELISHA SEE YISHMA'EL BEN ELISHA'

ISHRĀQĪYAH, from *ishrāq* (“illumination”), is the name of a school of esoteric philosophy in Islam. The two major currents of thought in the development of Islamic philosophy, one exoteric and the other esoteric, are known respectively as *falsafah* (“scholastic philosophy,” derived from Aristotle and Plato) and *ʿirfān* (a special type of philosophy derived from a metaphysical experience of Being through spiritual realization). Introduced into the West from the twelfth century onward through numerous translations from Arabic to Latin, it was *falsafah* that almost exclusively came to constitute “Islamic philosophy” in the West, while the

other important tradition, that of *ʿirfān*, was left in complete obscurity. But *ʿirfān* has always been a creative force in Islamic spirituality, and as such it has produced a type of philosophy that is quite different from, and in many respects sharply opposed to, *falsafah*.

IMAGINAL THINKING. The word *philosophy* tends to suggest the inner act of thinking as a logical outcome of reason. One has to be reminded, however, that philosophic thought is not necessarily activated only on the level of pure reason. Because human consciousness is extremely complicated and multilayered, various forms of thinking can be realized at different levels of the mind. “Imaginal” thinking is one of them.

“Imaginal” thinking, also known as “mythopoeic thinking” or “mythopoesis,” is a peculiar pattern of thinking that evolves through interconnections and interactions among a number of archetypal images in a particular depth-dimension of consciousness. In the technical terminology of Islamic *ʿirfān*, this depth-dimension is called the *ʿālam al-mithāl*, meaning literally the “world of symbolic images.” The type of philosophy produced by this kind of thinking naturally manifests remarkable differences from philosophy as a product of pure reason.

Imaginal thinking is not confined to Islamic *ʿirfān*. Quite the contrary; many different systems of philosophy that have come into being in various Asian regions reflect self-expressions of “imaginal” consciousness. The “illuminationism” (*ishrāqīyah*) of Suhrawardī represents one case, the “unity of being” (*wahdat al-wujūd*) of Ibn ʿArabī another. Complicating the matter with regard to the Islamic variety of “imaginal” or esoteric philosophy, however, is the fact that the majority of the first-rate thinkers in this domain were also great masters of Scholastic, exoteric philosophy, so that both the “imaginal” and the rational modes of thinking appear in subtle entanglements on the textual surface of their works. This is notably the case with men like Suhrawardī and Ibn al-ʿArabī.

Suhrawardī, in particular, is known to have written three voluminous books on scholasticism, *Kitāb al-talwīḥāt*, *Kitāb al-muqāwamāt*, and *Kitāb al-muṭarrahāt*, the famous trilogy attesting to his rarely surpassed accomplishment as an exoteric philosopher, prior to embarking upon the production of his major work on Illuminationism, *Ḥikmat al-ishrāq* (Theosophy of Illumination). As indicated by the title, this is essentially a product of imaginal thinking, representing a peculiar kind of esoteric philosophy based on a metaphysical experience of light. Yet it begins with a sober exposition of the principles of Aristotelian logic before gradually becoming an “imaginal” presentation of the hierarchic structure of the angels of light. It is important to note that this seemingly odd combination of the exoteric and esoteric modes of thinking, together with the very conception of *ishrāq*, can be traced back to Ibn Sīnā (Avicenna).

IBN SĪNĀ AND “ORIENTAL PHILOSOPHY.” In a number of respects, and particularly with regard to the idea of *ishrāq*, Ibn Sīnā may be considered an important precursor of

Suhrawardī. Quite characteristically, however, in Ibn Sīnā's work the rational and "imaginal" modes of thinking are still consciously and methodically separated from one another, so that *falsafah* and 'irfān are conceived as two independent and essentially different types of philosophy (although in the process of the structuralization of Ibn Sīnā's symbolic narratives, we sometimes notice technical concepts of Aristotelianism creeping into the "imaginal" space of 'irfān).

It is important to note that of the two types of philosophy Ibn Sīnā himself laid greater weight on the imaginal (i.e., esoteric) than on the rational (i.e., exoteric). At the outset of his *magnum opus*, the famous *Kitāb al-shifa'* (Book of Remedy, known in the West in Latin translation as *Sufficiētia*), which is a huge systematic exposition of Peripatetic philosophy, Ibn Sīnā declares that what he is going to write does not represent his personal thought but is intended to acquaint the students of philosophy with the thought-world of the ancient Greeks, Aristotle in particular.

As for his own "true thought," he seems to have long cherished the idea of giving a direct expression to it in a completely different book, *Al-ḥikmat al-mashriqīyah* (Oriental Philosophy), of which the now extant *Manṭiq al-mashriqīyīn* (The Logic of the Orientals) is only the introductory part. Whether completed or not, the book itself has not come down to us. Besides this work we have a few short treatises of esotericism and some symbolic tales from his own pen.

Ibn Sīnā's use of words meaning "Orient" and "Oriental" is significant here, for the word *mashriq* ("Orient"), from the root *shrq*, literally means the "place (*ma-*) where what is designated by the root *shrq* becomes activated," that is, the original point of "illumination" (*ishrāq*). The "Orient," in other words, is not a geographical notion, but a term designating the East in a mythopoeic or spiritual geography.

The "Orient" in this particular context is the sacred locus from which the divine light makes its appearance, illuminating the whole world of being, "the place where the sun rises," the ultimate origin of all existence. In the Persian commentary on Ibn Sīnā's mythic-symbolic tale, *Hayy ibn Yaqzan* (a proper name, literally "Living, son of Wakeful"), one of his disciples (Abū 'Ubayd al-Juzjānī?) explicates the symbolism of "Orient" and "Occident" in the following manner. Utilizing in his own way the Aristotelian theory of the distinction between "form" and "matter," he begins by stating that matter in and by itself has no existence, whereas form is the source of existence. Matter, in other words, is pure nonexistence. But his Iranian frame of reference naturally and immediately translates this proposition into another, namely, that matter in itself is sheer darkness. And he assigns matter (as darkness) to the Western region of the cosmos in the "imaginal" map of his symbolic geography.

The implication of this position is clear. Ibn Sīnā defines the Orient as the original abode of form (light), and thus symbolically as the world of "forms," or existential light, while the Occident is the world of "matter," that is, of darkness and nonexistence.

Matter turns into existence only by the influx of the all-existent luminous energy of form, coming from the divine Orient through the intermediary of ten angels—the number limited to ten in conformity with the ten celestial spheres of Hellenistic astronomy. Directly reflecting the divine light, the angels embody the highest degree of existential luminosity, while all other beings and things that become luminous (i.e., existent) through the illuminating activity of the angels are less bright (i.e., less densely existent). The existential luminosity naturally grows less and less intense as the rays of the divine light go down the scale of being (i.e., become further and further removed from its original source), until they merge almost totally into the darkness of matter when they reach the lowest stage of being.

As long as they do exist factually, the "things" in the empirical world are not sheer darkness. They are shadowy existents, faint reflections of the divine light. But since it is matter that is overwhelmingly dominant in this domain, the empirical world is "imaginally" represented as a world of darkness. In some privileged cases (notably the prophets), however, the human consciousness may suddenly flare up in glorious light under the influence of the Active Intellect (Gabriel, the angel of revelation), illuminating the world of darkness in which the souls of ordinary human beings are imprisoned—a typical theme of Gnosticism.

Such, in brief outline, is the general plan of the "Oriental philosophy" of Ibn Sīnā. Underlying it is clearly a vision of the cosmos as the interplay of light and shadow, a vast "imaginal" field in which the divine light appears in infinitely various and variegated forms, determining itself in accordance with various degrees of interfusion with material darkness through the light-transmitting activity of the angels. It is a Gnostic vision of the world permeated with the "imaginal" presence of the angels of light.

SUHRWARDĪ, FOUNDER OF THE ISHRĀQĪ SCHOOL. The esoteric worldview manifested in Ibn Sīnā's philosophy, with its strong Gnostic influences, was inherited in turn by Shihāb al-Dīn Yaḥyā ibn Ḥabash ibn Amīrak al-Suhrawardī (1153–1191), the real founder of the Illuminationist school in Iran. Significantly enough, Suhrawardī, who has come to be known by the honorary title Shaykh al-Ishrāq, "master of illumination," traces the "tradition" of his Illuminationist philosophy back to Hermes Agathodaemon (who appears in Islam under the figure of the prophet Idrīs). It must be remembered that long before the rise of Islam, the Mediterranean school of Hermetism had established itself in Alexandria, and from this center it had infiltrated into the wide domain of the Middle East. There, in the city of Harran, the "followers of the prophet Idris," the Sabaeans who venerated the *Corpus Hermeticum* as their scripture, cultivated the esoteric learning of Hermetism and propagated it in various directions. Through one of these it must have reached Suhrawardī.

In the "imaginal" dimension of Suhrawardī's consciousness, however, the history of Illuminationism (which he

straightforwardly identifies with the history of philosophy in general) takes on a remarkably original and peculiar form. Ishrāqī wisdom as the only authentic actualization of the “perennial philosophy” (*ḥikmah ‘atiqah*) of mankind has its ultimate origin in the divine revelations received by the prophet Idris, that is, Hermes, who thereby became the forefather of philosophy. This Hermetic wisdom was transmitted to posterity through two separate channels: Egyptian-Greek and ancient Iranian. The first branch of Hermetic wisdom, after flourishing in ancient Egypt, went to Greece, where it produced such Gnostic sages as Pythagoras, Empedocles, Plato, and Plotinus. The tradition was maintained in Islam by some of the eminent early Ṣūfīs, including Dhū al-Nūn (d. 859) and Sahl al-Tustarī (d. 896).

The second branch of Hermeticism, represented in ancient Iran by the mythical priest-kings Kayūmarth, Farīdūn, and Kay Khusraw, developed into the Sufism of Bāyazīd al-Bastāmī, generally known in the West as al-Biṣṭāmī (d. 874), and Maṣṣūr al-Ḥallāj (d. 922).

Suhrawardī considered himself the historical point of convergence between the two traditions, unifying and integrating into an existential, organic whole all the important elements of the Hermetic wisdom elaborated in the long course of its historical development. And to the integral whole of Gnostic ideas thus formed Suhrawardī gave a peculiar philosophical reformulation, structured in terms of the Zoroastrian symbolism of light and darkness—the term *Zoroastrianism* here understood in the sense of the spiritual, “esoteric” teaching of Zoroaster as distinguished from the “exoteric.”

East-West symbolism. In approaching Suhrawardī’s illuminationist philosophy, the first thing we must pay attention to is the symbolism of East and West. *Qiṣṣat al-ghurbah al-gharbīyah* (The Narrative of the Occidental Exile), which he composed in Arabic—most of his symbolic tales or narratives are in Persian—makes it clear that he attaches the same “imaginal” meanings to “Orient” and “Occident” as did Ibn Sīnā. Thus, the Orient for him too means the Orient of lights, the sacred place in which divine light originates, the source of spiritual as well as cosmic illumination, whereas the Occident is the abyss of material darkness, in which the human soul is imprisoned and from which it must set itself free so that it may go back to its real home, the Orient.

Hierarchy of lights. Rejecting (or radically modifying) the Aristotelian doctrine of hylomorphism, which explains every existent in terms of a conjunction of matter and specific form, Suhrawardī employs a completely different ontology, of Gnostic origin, explaining all things as degrees of light (or as various mixtures of light and darkness); the Aristotelian “form” thereby appears metamorphosed into an angel as a luminous being. Suhrawardian philosophy thus turns out to be an ontology of light, with varying degrees of intensity, in a hierarchical order.

Light, says Suhrawardī, is that which illuminates itself, and by so doing illuminates all other things. Light, otherwise

expressed, is that which exists by and in itself (i.e., light *is* existence) and by its own existence brings into existence all things. Light thus defies definition, while all other things can and must be defined in reference to it. Light, in short, is nothing other than the ontological “presence” (*ḥudūr*) of the things; it is the ultimate source of all existence. It follows, therefore, that the whole world of being must be realized as a grandiose hierarchy of lights, beginning with the absolute light in the highest degree of luminosity and ending with the weakest lights just about to sink into the reign of utter darkness (*ghasaq*), that is, absolute nonexistence.

What stands at the top of this cosmic hierarchy of light is the “light of lights” (*nūr al-anwār*), which, in the terminology of Islamic theology, is God. Beneath it, spreading down to the domain of the densely dark bodies in the physical world, are various degrees of light (existence), which, in Suhrawardī’s system, characteristically appear in the guise of angels who govern the world of being.

Unlike Ibn Sīnā’s angelology, which is Neoplatonic, Suhrawardī’s is fundamentally Zoroastrian. Rather than being limited to ten (corresponding to the ten heavens of Ptolemy), the number of angels is innumerable. Their function, moreover, is not limited to the Neoplatonic angels’ triple intellection of their origin, of themselves, and of those that come out of them. As a result, the hierarchy of Suhrawardī’s angelology is far more complicated than that of Ibn Sīnā. There are, to begin with, two different basic orders of angels, “longitudinal” (*ṭūlī*) and “latitudinal” (*‘ardīī*), with regard to their successive generations, their spatial disposition, and their functions.

Longitudinal and latitudinal order. The longitudinal order of angels lays the primary foundation of the world of being in its entirety as a “temple of light,” or rather, a dazzling complex of “temples of light” (*ḥayākil al-nūr*; sg., *ḥaykal al-nūr*), radiant with angels reflecting the “light of lights” and mutually reflecting each other. Their procession is described by Suhrawardī in the following manner.

From the “light of lights,” representing the highest and ultimate point of cosmic-metaphysical luminosity, proceeds the archangel Bahmān, who is the “nearest light” (*nūr aqrab*). Directly contemplating his own origin, the “light of lights,” the archangel Bahmān reflects it without any intermediary. And this immediately brings into being another light-entity, or archangel, which is doubly illuminated, receiving as it does illumination directly from the “light of lights” and from the first light from which it has arisen. The double illumination of the second light immediately generates the third light, which is now illuminated four times, once by the “light of lights,” once by the first light, and twice by the second light (the second light being, as we have just seen, itself doubly illuminated). And so continues the downward procession of the archangels, resulting in the constitution of the “longitudinal” order of lights. Each one of these angelic lights is called in Suhrawardī’s technical terminology a “dominating light” (*nūr qāhīr*), with “forceful domination”

(*qabr*) one of the basic principles determining the activity of these angels.

This longitudinal order of archangels of light has in itself two mutually opposed aspects, the masculine and the feminine, from the former of which issues an essentially different order of angels, the latitudinal. Unlike the archangels of the longitudinal order, the latitudinal angels do not generate one another, but simply coexist horizontally, positioned side by side, thus constituting the world of eternal “archetypes” that are “imaginal” equivalents of the Platonic ideas. Suhrawardī calls them in this capacity the “lords of the species” (*arbāb al-anwāʾ*; sg., *rabb al-nawʾ*). Every thing in the empirical world specifically stands under the domination of a lord of the species; in other words, every individual existent in our world has its corresponding metaphysical archetype in the angelic dimension of being, somewhat like the ontological relationship between the individual and universal realms in Platonic idealism. Each existent in the empirical world is technically called the “talisman” (*ṭilasm*) of a particular angel governing and guarding it from above. And the angel in this capacity is called the “lord of the talisman” (*rabb al-ṭilasm*).

As for the feminine aspect of the longitudinal order of angels, it primarily has to do with such negative attributes as being dominated, being dependent, being receptive to illumination, being remote from the “light of lights,” nonbeing, and so on. The fixed stars and the visible heavens come into being from it as so many hypostatizations of the luminous energies of the archangels. And this marks the ending point of the Orient and the beginning point of the Occident.

The latitudinal order of angels gives rise to still another order of angels, whose basic function is to govern the species in the capacity of vicegerents of the “lords of the species.” These deputy angels are called by Suhrawardī the “directive lights” (*anwār mudabbirah*; sg., *nūr mudabbir*). Using the characteristic Persian word *ispahbad*, meaning “commander-in-chief,” Suhrawardī calls them also “light-generalissimos” (*anwār isfahbadīyah*). These are the angels who are charged with maintaining the movement of the heavens, and who, as the agents of the “lords of the species,” govern all the species of the creatures in the physical world, including human beings, whose shared “lord of the species” is the archangel Gabriel (Jibrīl). The “deputy governor” (*ispahbad*, the “light-generalissimo”) of Gabriel resides in the inmost part of the soul of each human being, issuing directions concerning his or her internal and external acts.

As will be clearly observable even from this very brief, and necessarily incomplete, exposition, Suhrawardī’s Illuminationist worldview is fundamentally mandalic in nature. The world of being in its entirety is conceived or imaged as a vast cosmic mandala composed of innumerable angels of light spreading out in geometric designs along longitudinal and latitudinal axes. Here we have a typical product of mandalic consciousness completely self-realized in the

form of a vision of the whole world of being appearing as an “imaginal” space saturated with light.

POST-SUHRAWARDIAN DEVELOPMENTS. Suhrawardī’s life was extremely short; in the citadel of Aleppo where he was imprisoned as a propagator of anti-Islamic “new ideas” he was murdered at the age of thirty-eight in the year 1191. But after his death the influence of his Ishrāqī teaching grew stronger in the Islamic world, particularly in Iran, where it exercised the greatest influence on the historical formation of the philosophy of Shiism.

The long chain of followers of the Master of Illumination begins with Shams al-Dīn Shahrāzūrī (thirteenth century), who studied personally under Suhrawardī or under one of his direct disciples. He wrote the first systematic and most extensive commentary on the *Hikmat al-ishrāq*, thereby preparing the ground for subsequent interpretations of this fundamental work of Illuminationism. It was, as a matter of fact, in complete reliance on this commentary that Quṭb al-Dīn Shīrāzī (d. 1311) composed his famous commentary on the *Hikmat al-ishrāq*.

Shahrāzūrī was in reality a far more original thinker than Quṭb al-Dīn Shīrāzī, and his commentary was far more important and interesting than Quṭb al-Dīn’s, which is now known to be an abbreviated version. Quṭb al-Dīn’s fame, however, soon overshadowed that of his great predecessor, so that his commentary came to be regarded as virtually *the* commentary on the *Hikmat al-ishrāq*; thus from the early fourteenth century until today almost all those who have been interested in Suhrawardian Illuminationism have read or studied the book mainly through the interpretation given by Quṭb al-Dīn.

The historical importance of Quṭb al-Dīn lies in the fact that besides being an ardent propagator of Illuminationism, he was also a disciple of Ṣadr al-Dīn Qūnawī (or Qunyawī), a personal disciple of Ibn al-ʿArabī and his son-in-law, and that through this channel he was well versed in the *waḥdat al-wujūd* type of philosophy. In fact, Quṭb al-Dīn is counted among the greatest expositors of Ibn al-ʿArabī’s ideas. Combining thus in his own person these two important currents of the post-Avicennian Islamic philosophy, Quṭb al-Dīn fundamentally determined the subsequent course of the development of the Ishrāqī school. Indeed, after Quṭb al-Dīn, Suhrawardian Illuminationism quickly assimilated into its structure the major ideas of the “unity of existence” that had been independently developed by the school of Ibn al-ʿArabī.

The work of integration reached its first stage of completion in the Safavid period in Iran. The two centuries of the Safavid dynasty (1499–1720), during which the city of Isfahan was the political and cultural center and Twelver Shiism was the recognized form of Islam, realized what is often called the “renaissance of Islamic [Shīʿī] culture.” It was in the flourishing city of Isfahan that the intellectual heritages of Ibn al-ʿArabī and Suhrawardī were harmoniously inte-

grated into an organic whole through the works of generations of outstanding thinkers. These thinkers are now referred to among historians of Islamic philosophy as the “school of Isfahan,” the greatest figure in which is uncontestedly Ṣadr al-Dīn Shīrāzī (popularly known as Mullā Ṣadrā, 1571–1640).

Mullā Ṣadrā’s philosophy is a colossal and complicated system, synthesizing ideas derived from various sources in conjunction with his own quite original thoughts. As regards Illuminationism, Mullā Ṣadrā made thoroughly explicit what had from the beginning been implicit (and occasionally explicit), namely, the complete identification of “light” with “existence.” In this way, “existence” became totally synonymous with “luminosity.” The existence of each thing is in the metaphysical-“imaginal” vision of Mullā Ṣadrā nothing other than a degree of light, a luminous issue or illumination from the “light of lights.” The “light of lights” itself is completely identified with what is referred to in Ibn al-‘Arabī’s *waḥdat al-wujūd* system as the “one,” that is, existence in its primordial state of absolute undetermination, but ready to start determining itself in an infinity of different ontological self-manifestations.

TOSHIHIKO IZUTSU (1987)
Revised Bibliography

ISHTAR SEE INANNA

ISIDORE OF SEVILLE (560–636), bishop of Seville (603–636), proclaimed “eminent teacher and an honor to the church” by the Council of Toledo of 653. Member of an eminent Andalusian family, Isidore was prepared to inherit the see of Seville by his older brother Leandro, also bishop of Seville. In his youth the king, Leovigild (r. 569–586), was able to stabilize the Visigothic kingdom, in which a minority of Visigoths (Germanic peoples who entered the Iberian Peninsula in the fifth century) and a vast majority of ancient inhabitants (the Hispano-Romans) coexisted. Under Recared (d. 601) the Goths abjured the Arian doctrine and embraced the Catholic faith (c. 589). In 614 the Jews were forced by Sisebut to convert to Christianity.

Through his pastoral leadership, Isidore imbued the Visigothic church with the same concerns that dominate his writings: respect for the political authority of the Goths, incitation for increasing participation of the Hispano-Romans in the life of the church, and an overriding intellectual and moral commitment. A famous orator, he presided at the Council of Seville of 619 and at the Council of Toledo of 633. Mild and conciliatory, Isidore was a man of great human and Christian optimism; he struggled with his own strict education and with the intransigent atmosphere of the church after the triumph of catholic orthodoxy against the Arians, and over tensions with Jews after 614.

Isidore’s writings, cataloged by his friend Braulio (d. 651), bishop of Zaragoza, may be grouped as follows:

1. biblical studies;
2. handbooks for clergy and monks: *Concerning the Ecclesiastical Offices, A Monastic Rule, Vademecum of the Catholic Faith for Use in Discussion with the Jews*, and *Catalog of Heresies*;
3. guides for personal and public spiritual development: *Synonyms* and *Sentences*;
4. works on civic education: *About the Universe*, an explanation of the system of the world and of natural phenomena for the purpose of preventing fear and superstition;
5. works extolling the national glory: *History of the Goths, Vandals, and Suevi; Praise of Spain; Chronicle of the World*; and *Catalog of Illustrious Men*, an innovation in this genre insofar as it introduces persons distinguished by their pastoral activity; and
6. works on general education, based largely upon linguistic or grammatical explanations: *Differences between Words*, his first writing, and *Etymologies*, on which he labored until his death and which was completed by Braulio.

He also wrote poems and letters, and he probably took part in preparing the *Collectio canonica Hispana* (Collection of

church councils), covering both ecumenical and Spanish councils. Both Christian and non-Christian authors are cited in Isidore's writings with admiration and appreciation.

Isidore is best known through his *Synonyms* (known in manuscripts as "Soliloquies," a dialogue between humanity and its reason), which employed a new technique of parallel phrases with progressive variation of words. This work was simultaneously a source of practical vocabulary and a mechanism of catharsis that promoted in the reader a unified spirituality. It includes simple moral teaching and formulas for spiritual enlightenment. In three books, *Sentences* (*On the Greatest Good* in manuscripts) summarizes the spiritual organization of the human community by duties and obligations. It is in the form of easily memorized proverbs based upon Christian authors, and it combines moral knowledge with living experience. *Etymologies* (also named *Origines*), in twenty books, classifies and defines, according to a personal system of etymological interpretation, all the knowledge of Isidore's time as drawn from ancient sources through commentaries, glosses, and scholastic handbooks. In the Middle Ages it was considered the basic reference work for understanding texts and for coherently interpreting the world.

MANUEL C. DÍAZ Y DÍAZ (1987 AND 2005)
Translated from Spanish by Maria Elisa Guirola

ISIS is one of the most important deities in the Egyptian pantheon. The hieroglyph for her name was the throne, and she was portrayed with a headdress in the shape of a throne. Scholars postulate that Isis was the personification of the throne or that her name means "the one who has ruling power." Jan Bergman concludes in "Isis" (1980, col. 188) that the explanation of her name points to a later priestly interpretation. The name Isis appears securely for the first time in the fifth dynasty (2465–2325 BCE) and in the *Pyramid Texts* at the end of the Old Kingdom (2650–2152 BCE). The first depiction of the goddess occurred almost a thousand years after the first textual mention in the eighteenth dynasty (1539–1295 BCE).

In the Heliopolitan rendering of the nine premier Egyptian gods, Isis was the daughter of Geb and Nut (Earth and Sky). Osiris was her brother and husband, Horus their son.

Seth and Nephthys, also offsprings of Geb and Nut, were Isis and Osiris's opponents. Seth killed his brother Osiris and dismembered him, and Isis searched for the scattered body parts across Egypt. She found all the parts except for the phallus. Isis then fashioned a replacement for the missing part and reassembled her brother-husband's body. With the help of Thoth, she revived Osiris for a short time. In this period of revival Isis conceived Horus, who became his father's avenger.

Being a mother herself, Isis helped women in childbirth. In the New Kingdom (1539–1069 BCE), Isis was depicted as midwife. Greco-Roman renderings of Isis show her with a knot on the front of her dress. This knot indicated life and protected pregnant women as well as their babies. The goddess was also a healer. When a scorpion stung and killed her son Horus, Isis revived him. In another myth Isis fashioned a snake that bit the supreme god Re. As Re lay dying, Isis promised to heal him if he gave up his secret name and thus world dominion. Re refused at first, but in the end he gave Isis what she sought. In another succession myth, Horus raped and decapitated his mother, the latter as punishment for Isis's disloyalty when she did not allow the destruction of her brother Seth. The Greek writers Diodorus Siculus (1.13–27) and Plutarch (*De Iside et Osiride*, 12–19) provide the most continuous myths surrounding Isis. Various aretologies emphasize her henotheistic, singular divine force of creation; she was the goddess with a thousand names (*myrionyma*).

Isis was linked to the goddess Hathor. She wore Hathor's headdress, the cow horns. In his "Isis," Bergman points to another connection with Hathor (Bergman, 1980, col. 189f.). After Horus decapitated his mother, she received a cow head as replacement. Like the cow horns and cow head, Isis acquired the uraeus snake from Hathor. In addition, Isis was equated with Selket and appropriated that goddess's animal form, the scorpion. Isis was also linked to the female hippopotamus, a white sow, and a lion. Bergman notes that the goddess appears as a water- and food-providing tree goddess. In the celestial sphere Isis was connected with Sothis or Sirius, the Dog Star (Canis Major). She was the bringer of the Nile's annual flooding (Bergman, 1980, col. 192), which was essential for Egypt's agriculture. Isis's manifestations are manifold due to syncretism, an inbuilt fluidity that allowed gods to merge with each other. Depictions of Isis from Egyptian to Greco-Roman times show this confluence of representative elements most succinctly. Isis was not only *myrionyma* in name but also in terms of her iconographic signifiers.

DISSEMINATION OF THE CULT. Greeks, who had economic links with Egypt since the seventh century BCE, knew of Egyptian deities. They explained these deities by way of analogies. In this way Isis was equated with Demeter (Herodotus, *Histories*, 2.42ff.). The Ptolemaic period, however, ushered in a more intensive propagation of the cult of Isis outside Egypt. In this era, as in Roman times, the most important temple structure of Isis was on the island of Philae in south-

ern (Upper) Egypt. Alexander's successor, Ptolemy I Soter, chose Sarapis as his dynasty's guardian deity. This god then became Isis's Hellenized consort.

An inscription from Piraeus (Vidman, 1969, inscription no. 1), the port city of Athens, dated to 333 BCE suggests that cult adherents were first Egyptians who had economic ties with Athens. By the end of the third century BCE Athenian citizens held the various priesthoods. On Delos, the most important location for the westward dissemination of the cult, Egyptians held the priesthoods initially, followed by Delians and then Athenians. Françoise Dunand demonstrates in *Le culte d'Isis dans le bassin oriental de la Méditerranée* (1973) that, in all of Greece, Isis had the lowest impact on the Peloponnese. Michel Malaise shows in "La diffusion des cultes égyptiens dans les provinces européennes de l'Empire romain" (1984) that merchants were the most important propagators of the cult. When Archelaos, a general of Mithridates VI, the king of Pontus, captured the island of Delos in 88 BCE, Italian merchants returning to Italy brought with them the goddess Isis and intensified the goddess's presence where she was already known before this time.

Isis, for example, was established before 88 BCE in the port cities of Pompeii, Puteoli, and Ostia. The temple of Isis in Pompeii was built toward the end of the second century BCE, the temple of the Alexandrian gods in Puteoli dates to approximately 105 BCE. However, it seems that, in the wake of the forceful return of Italian merchants from Delos, Isis made her way to Rome. The second century CE author Apuleius states in his *Metamorphoses*, also known as *The Golden Ass* (11.30), that the first association of Isiac priests (*collegium pastophorum*, college of carriers of sacred objects) in Rome was founded at the time of the dictator Sulla (82–79 BCE). An inscription, unfortunately now lost, established a strong connection between Delos and Rome (Vidman, 1969, inscription no. 377). In "Iside Capitolina, Clodio e i mercanti di schiavi" (1984) Filippo Coarelli convincingly dates the inscription to 90–60 BCE and points to families of slave traders as a decisive link between the Aegean island and the capital. Ladislav Vidman suggests in *Isis und Sarapis bei den Griechen und Römern* (1970) that the Late Republican period was favorable to the Egyptian cult. Subsequent research showed that it was not unbridled passions of the simple and disfranchised that brought about this acceptance. Egyptian scenes and representations of Isis's headdress, rattles (*sistra*), Egyptian snakes (uraei), obelisks, and lotus flowers were components of an artistic repertoire. Control marks on coins were not expressions of a social revolution but an artistic realization of a Late Republican cultural reality.

The reactions against the cult in 58, 53, and 48 BCE were of a political nature (Tertullian, *Ad Nationes*, 1.10; Dio Cassius, 40.47 and 42.26). The Roman Senate found itself stripped of its political power and, as a consequence, dictated these expulsions of the cult of Isis. Expulsion as well as acceptance and subsequent introduction of a foreign cult into Rome's religious system were privileges of the Senate. These

actions demonstrated, confirmed, and secured the Senate's political authority. Isis, however, did not disappear from Rome. Far from it, the triumvirate in charge of restoring the Republic voted in favor of a temple of Isis in 43 BCE (Cassius Dio, 47.15.4). Two later regulations (28 and 21 BCE; Cassius Dio, 53.2.4 and 54.6.6) curtailing the cult within the city of Rome were intended by Augustus to demonstrate his resolve vis-à-vis the traditional code of behavior (the *mos maiorum*) and the traditional, Greco-Roman gods.

In 19 CE Tiberius ordered the removal of Jews and Isis worshipers from Rome (Tacitus, *Annals*, 2.85.5; Josephus, *Antiquities*, 18.72; Suetonius, *Life of Tiberius*, 36.1). It has been suggested that the emperor intended to cleanse the capital of foreign cults, especially those perceived as undermining Roman morality, but it seems more likely that the reason was political. Germanicus, Tiberius's designated successor, had traveled to Egypt and, in a public relations stunt, opened the granaries. Unfortunately, this gesture of generosity led subsequently to famine in Rome (Tacitus, *Annals*, 2.67). Germanicus also visited Memphis without imperial permission. The priests of Memphis, the guardians of the living and dead Apis bulls, made and unmade pharaohs, even if only symbolically at this time (Maystre, 1992).

In the Roman construct of reality, politics and religion were intertwined; hence Rome's success was thought dependent on the gods and the gods favored a people who worshiped them properly and in a timely fashion. Whenever a political crisis occurred that undermined Rome's social order, the problem was thought to lie in the religious sphere; that is, it was believed that the gods had turned away from the Romans, who had failed in their ritual performance. Isis was Alexandria's most powerful god, and the city had the largest number of Jewish inhabitants in the Roman Empire. The expulsion of Jews and Isis worshipers from Rome demonstrated the emperor's political power and symbolized the reestablishment of traditional order.

With the consolidation of the new political order (the principate, which began with the emperor Augustus [r. 27 BCE–14 CE]) and the integration of Egypt as a province of the Roman Empire, Isis and her cult could no longer be thought illegal. The cult was officially recognized at the end of Caligula's reign or at the beginning of Claudius's. The first to establish this time period was Georg Wissowa in *Religion and Kultus der Römer* (1971), and Anthony Barrett in *Caligula* (1989, pp. 220f.) further developed the argument. The connection with the imperial house (the *domus Augusta*) occurred during the reign of Vespasian (69–79 CE). Vespasian had been proclaimed emperor by his troops while he was in Alexandria. Upon his return to Rome, he and his son Titus stayed in the temple of Isis in the Field of Mars, the *Iseum Campense*, the night before their triumphal procession into Rome (Josephus, *Jewish Wars*, 7.123f.). Domitian, Vespasian's youngest son, renovated many temples of Isis during his reign (81–96 CE). After Vespasian's acclamation in Alexandria, the family had a connection to Isis, and their subse-

quent actions are demonstrations of piety toward the goddess.

There was an increasing interest in Egyptian and Egyptianizing objects at the time of the emperor Hadrian (114–141 CE), which had to do with the emperor's interest in Egypt. The city of Alexandria possessed the most important libraries of antiquity. Hadrian was a philhellene (a lover of Greek culture), and the Alexandrian libraries were the guardians of Greek literature and culture. It also happened that Hadrian's beloved Antinous had drowned in the Nile while visiting Egypt with the emperor. The death of a friend and accessibility to a cherished cultural heritage made Egypt so prominent in Hadrian's life that it brought about a new artistic movement. Even Hadrian's villa outside Rome featured an Egypt-inspired area.

Inscriptions asking for the well-being (*salus*) of the imperial household (*domus Augusta*) in the name of Isis's Hellenistic consort Sarapis appear predominantly in the period after Emperor Marcus Aurelius's victory over the Quadi, a Germanic people. István Tóth established in "Marcus Aurelius' Miracle of the Rain and the Egyptian Cults in the Danube Region" (1976) that the dedicators of these inscriptions were the emperor's generals. As the Quadi were close to victory on a blazing hot day, Arnouphis, a *hierogrammateus* (cultic scribe) and member of Marcus Aurelius's entourage, induced rain and alleviated the Roman legions' debilitating thirst. The Romans thus gained the advantage over their adversaries (Cassius Dio, 71.8). Isis and her consort Sarapis were now fully accepted guarantors of the Empire's well-being. Ultimately, at the time of the Severi (193–235 CE), the Roman dynastic ideology corresponded to the pharaonic-Ptolemaic one. Like Vespasian more than a century earlier, the legions of the East had made Septimius Severus, the founder of the dynasty, emperor.

RELIGION PRACTICES. Two major festivals in honor of Isis are known: the public launching of the ship of Isis—the *navigium Isidis*, or *ploiaphesia*—which was celebrated on March 5 (Apuleius, *Metamorphoses*, 11.8–17), and the finding of Osiris—the *inventio* or *heuresis Osiridis*—from October 28 to November 3. A cult association had five *antistites* (priests or carriers of sacred objects), *pastophori* or *hierophori*, who in the cult hierarchy were below a *sacerdos*, priest. These five carried various insignia during a procession (Apuleius, *Metamorphoses*, 11.10). A *sacerdos* (man or woman) held his or her position for a year, sometimes for life. The lower priesthoods and cult positions were most often held for life. Inscriptions name guardians of temples (*neokoroi* or *zakoroi*), who may have helped during sacrifices. In the West the *pastophori* were equated with *hierophori* (both carriers of sacred objects) or *hagiophori* (carriers of the sacred) during imperial times. Greeks living in Egypt translated the title of the highest priest in the cult as *prophetes* (prophet). Outside Egypt, however, a *prophetes* is best thought of as *pastophorus*. In the Egyptian system the dresser (*stolistes*) held the second highest position after the prophets.

Documentation, however, records dressers of statues only in Athens in the second and third century CE.

In the West there is only one inscription of a dresser, an *ornatrix fani* (Vidman, 1969, inscription no. 731). Scribes (*scriba*, *grammateus*, or *hierogrammateus*) (Apuleius, *Metamorphoses*, 11.17), follow the dressers in the Egyptian priestly hierarchy. They are, however, like astrologers (*horoskopoi* or *horologoi*) and singers (*hymnodoi*), not documented outside Egypt. *Therapeutai* or *cultores* were cult adherents without rank and function. The official heading the *ploiaphesia* in March, the *nauarchus*, *trierarchos*, *hieronauates*, or *naubates*, is only known through inscriptions from Rome's imperial period. He or she was not a priest but a lay member of the cult association. In general, one notes that priests and lay cult functionaries could have the same designation. In addition, not every dedicator of an inscription was a cult initiate. Most of the personal inscriptions were put up in fulfillment of a vow (*ex-voto*), and most of the official ones (*pro salute imperatoris*, for the well-being of the emperor) were political in nature.

In Roman times, temples of Isis (*Isea*) were most often found outside the religious border of a city (the *pomerium*) and in an aqueous area in the vicinity of a river, an important water source, a marsh, or a port. Unlike Greco-Roman temples, *Isea* were not oriented toward public spaces. Even the innermost part of a temple of Isis, the *cella* (*naos*), opened only inward. The doors of the temple were opened and closed in connection with a morning and an afternoon ceremony. Sacrifice was given during these ceremonies. Although Plutarch mentions sacrifice of a white and a saffron-colored rooster to Osiris (Plutarch, *De Iside et Osiride*, 61; see Griffiths, 1970, p. 518) and red cattle to Seth (Plutarch, *De Iside et Osiride*, 31; Griffiths, 1970, pp. 414–415), his treatise does not reveal what kind of sacrifice Isis received. Apuleius, in his *Metamorphoses* (11.21ff.), indicates that there were three initiation rituals. Whether this was indeed true is not known with certainty. As was the case with other mystery cults, the preparations of an initiate included abstinence and purification. The initiate (*mystes*) experienced death and through it achieved new life. In contrast to public cults, social standing did not translate to a comparable position in the hierarchy of this mystery cult. The origins of the Isiac mysteries are not easily discerned, but it seems that there was an Egyptian element (Bianchi, 1980; Griffiths, 1970, pp. 390–392; Plutarch, *De Iside et Osiride*, 27; Junge, 1979; and Kákosy, 1999). The premier temple of Isis, the *Iseum* on Philae, closed its doors forever during the reign of Justinian I (527–561 CE).

ISLAM: AN OVERVIEW [FIRST EDITION]

The root *slm* in Arabic means "to be in peace, to be an integral whole." From this root comes *islām*, meaning "to surrender to God's law and thus to be an integral whole," and *muslim*, a person who so surrenders. It is important to note that two other key terms used in the Qur'an with high frequency have similar root meanings: *īmān* (from *amn*), "to be safe and at peace with oneself," and *taqwā* (from *wqy*), "to protect or save." These definitions give us an insight into the most fundamental religious attitude of Islam: to maintain wholeness and proper order, as the opposite of disintegration, by accepting God's law. It is in this sense that the entire universe and its content are declared by the Qur'an to be *muslim*, that

is, endowed with order through obedience to God's law; but whereas nature obeys God's law automatically, humanity ought to obey it by choice. In keeping with this distinction, God's function is to integrate human personality, both individual and corporate: "Be not like those who forgot God, and [eventually] God caused them to forget themselves" (*sūrah* 59:19).

ORIGIN AND HISTORY. Muslims believe that Islam is God's eternal religion, described in the Qur'ān as "the primordial nature upon which God created mankind" (30:30). Further, the Qur'ān claims that the proper name *Muslim* was given by Abraham (22:78). As a historical phenomenon, however, Islam originated in Arabia in the early seventh century CE. Two broad elements should be distinguished in that immediate religious backdrop: the purely Arab background and the penetration of Judeo-Christian elements. The Qur'ān makes a disapproving reference to star worship (41:37), which is said to have come from the Babylonian star cult. For the most part, however, the bedouin were a secular people with little idea of an afterlife. At the sanctuaries (*ḥarams*) that had been established in some parts, fetishism seems to have developed into idol worship; the most important of these sites was the Ka'bah at Mecca.

The bedouin Arabs believed in a blind fate that inescapably determined birth, sustenance (because of the precarious life conditions in the desert), and death. These Arabs also had a code of honor (called *murūwah*, or "manliness") that may be regarded as their real religious ethics; its main constituent was tribal honor—the crown of all their values—encompassing the honor of women, bravery, hospitality, honoring one's promises and pacts, and last but not least, vengeance (*tha'r*). They believed that the ghost of a slain person would cry out from the grave until his thirst for the blood of vengeance was quenched. According to the code, it was not necessarily the killer who was slain in retaliation, but a person from among his kin equal in value to the person killed. For reasons of economics or honor, infant girls were often slain, and this practice, terminated by the Qur'ān, was regarded as having had religious sanction (6:137).

In southwestern Arabia, a rather highly sophisticated civilization had existed since the Sabian period, with a prosperous economy and agriculture. The Sabian religion was, at the beginning, a trinitarian star cult, which was replaced, in the fourth century CE, by the monotheistic cult of al-Rahman (a term that appears to have traveled north and found a prominent place in the Qur'ān, where it means "the merciful"). In the sixth century CE, Jewish and Christian ideas and formulas were adopted, with the term *al-Rahmān* applied to the first person of the Trinity.

As for the Judeo-Christian tradition, it was not only present where Jewish and Christian populations existed (Jews in Medina—pre-Islamic Yathrib—in the south and in Khaybar in the north; Christians in the south, in Iraq, in Syria, and in certain tribes), but it had percolated in the air, generally speaking. Indeed, there had been Jewish and Christian

attempts at proselytizing the Meccans, but these were unsuccessful because the Meccans wanted a new religion and scripture of their own, "whereby they would be better guided than those earlier communities" (35:42, 6:157). In the process, the Meccans had nevertheless come to know a good deal about Judeo-Christian ideas (6:92), and several people in Mecca and elsewhere had arrived at the idea of monotheism. Even so, they could not get rid of the "intermediary gods" for whom they had special cults, and there was still no cult for God, whom they called "Allāh," or "the God." In addition to these limitations, there was also a great disparity between the rich and the poor and disenfranchised in the thriving commercial community of Mecca. Both of these issues are strongly emphasized from the beginning of the Qur'anic revelation, making it clear that the primary background of Islam is Arab rather than Judeo-Christian, although the latter tradition has strongly influenced Islam. In its genesis, Islam grew out of the problems existing in an Arab Meccan society.

Early development of the community. During a twelve-year struggle in Mecca (610–622 CE), the prophet Muḥammad had gathered a devoted group of followers, largely among the poor but also among the well-to-do merchants. Yet his movement seemed to reach an impasse because of the unflinching opposition of the mercantile aristocracy, which saw in it a threat to both of their vested interests—their Ka'bah-centered religion, from which they benefited as custodians of the sanctuary and recipients of income from the pilgrimage, and their privileged control of trade. After Muḥammad and his followers emigrated from Mecca to Medina in 622 (the beginning of the lunar Islamic calendar, called the *hijrī*, or "emigration," calendar), at the invitation of the majority of the Arab inhabitants there, he became the head of both the nascent community and the existing polity. However, while he gave laws, waged peace and war, and created social institutions, he never claimed to be a ruler, a lawgiver, a judge, or a general; he referred to himself always as a messenger of God. As a result, not only were Islamic "religious" doctrine and ritual in the narrower sense regarded as Islamic but so were the state, the law, and social institutions. Islam is thus the name of a total way of life and does not merely regulate the individual's private relationship with God.

In Medina, then, the Prophet was able to institute his social reforms through the exercise of the religious and political power that he had been denied in Mecca. After three battles in which Muslims gained the upper hand over the Meccans and their allies, Islam, now in rapid ascendancy, was able to take Mecca peacefully in AH 8/630 CE along with a large part, if not the whole, of the Arabian Peninsula. In Medina, too, the Muslim community (*ummah muslimah*) was formally launched in 2/624 as the "median community," the only community consciously established by the founder of a religion for a specific purpose, as the Qur'ān speaks of those "who, when we give them power on the earth, shall establish prayers and welfare of the poor and shall command good and

forbid evil” (22:41). At the same time, the Qurʾān (22:40) provided this community with the instrument of *jihād* (utmost exertion in God’s cause, including peaceful means but also cold and hot war). Finally, Mecca was declared to be the goal of annual pilgrimage for the faithful and also the direction (*qiblah*) for prayer instead of Jerusalem. Both the constitution and the anchoring of the community were complete.

After a brief lapse into tribal sovereignty following the Prophet’s death, Arab resistance to the acknowledgment of Medina’s central authority was broken by force. The tribesmen’s energies were turned outward in conquests of neighboring lands under the banner of Islam, which provided the necessary zeal for rapid military and political expansion. Within a century after the Prophet’s death, Muslim Arabs were administering an empire stretching from the southern borders of France through North Africa and the Middle East, across Central Asia and into Sind. Muslim rule in the conquered territories was generally tolerant and humane; there was no policy of converting non-Muslims to Islam. The purpose of *jihād* was not conversion but the establishment of Islamic rule. Nonetheless, partly because of certain disabilities imposed by Islamic law on non-Muslim subjects (mainly the *jizyah*, or poll tax—although they were exempt from the *zakāt*, or alms tax levied on Muslims, the *jizyah* was the heavier of the two, particularly for the lower strata of the population) and partly because of Islamic egalitarianism, Islam spread quickly after an initial period during which conversions were sometimes even discouraged. This was the first phase of the spread of Islam; later on, as we shall see, Muslim mystics, or the *Šūfīs*, were the main vehicles of Islamic expansion in India, Central Asia, and sub-Saharan Africa, although the role of traders in the Indian and Indonesian coastal areas and China must not be minimized. Even in the twentieth century, Turkish soldiers brought Islam to South Korea during the Korean War.

Several major developments in this early period affected the religious texture of the Muslim community as a continuing phenomenon. Less than half a century after the Prophet’s death, political dissensions over succession led to civil war. A number of groups called the *Khārijīs* (“those who went out”) declared war on the community at large because it tolerated rule by “unrighteous” men; they claimed that a Muslim ceased to be a Muslim by committing a reprehensible act without sincerely repenting, and that other Muslims who did not regard such a person as non-Muslim also became non-Muslim. In reaction to the *Khārijīs* and the ensuing civil strife, the community (both the *Sunnī* mainstream and the *Shīʿah*, or party of ʿAlī) generally adopted a religious stand that not only was tolerant of religious and political deviations from strict Islamic norms but was even positively accommodating toward them. The members of the community who took this stand were known as the *Murjiʿah* (from *irjāʿ*, meaning “postponement,” in the sense of not judging a person’s religious worth, but leaving it to God’s judgment on the Last Day). The net result of this basic development was

that excommunication was ruled out so long as a person recognized the community as Muslim and professed that “there is no god but God and Muḥammad is his prophet.”

This formula created or rationalized accommodation for an amazing range of different religious opinions and practices under one God and Muḥammad’s prophethood. Oddly enough, the only systematically rigid and illiberal school of doctrine that persecuted its opponents, after it became state creed under the Abbasid caliph al-Maʾmūn in the first half of the ninth century, was the liberal rationalist school of the *Muʿtazilah*. The emergence of this school was largely the result of the impact on the Islamic religion of the wholesale translations of Greek works of science, philosophy, and medicine into Arabic on the orders of al-Maʾmūn. The *Muʿtazilah* tried to create necessary free space by insisting on freedom of human will and God’s rational justice, but the Muslim orthodoxy, countering with doctrines of the inefficacy of human will and the absolutism of God’s will and divine predeterminism, actually provided more accommodation for varying opinions and human actions and thereby halted the growth of the rationalist school.

With the advent of the Abbasids, there were other political, social, and religious changes as well, among them the improvement of the status of the Iranians, who, under Umayyad rule, were denied an identity of their own as “clients” (*mauwālī*) of the Arab tribes; and the espousal and implementation of legal measures created by the religious leadership, which had been largely alienated from the Umayyads. All of these developments combined to facilitate the rapid spread of Islam.

Medieval and later developments. With the weakening of the central caliphal authority in Baghdad, the tenth century saw not only the virtual fragmentation of the Abbasid Empire and the rise of *de facto* independent rulers (sultans and emirs) in the provinces but the almost ubiquitous rise of the *Shīʿah*. While Baghdad came under the political and fiscal “management” of the orthodox Twelver *Shīʿah* through the Persian Buyid family, Egypt and North Africa came under the rule of the *Ismāʿīlī* Fatimids. But if the Buyids were able to influence Islamic practices in some ways—such as the observance of ʿĀshūrāʿ, the tenth of Muḥarram (the first month of the Islamic calendar) as the commemoration of the martyrdom of the Prophet’s grandson Ḥusayn at the hands of the Umayyad troops—Fatimid rule, by and large, did not leave much of a trace on later Muslim thought and institutions, despite the fact that the *Ismāʿīlīyah* had offered a revolutionary ideology claiming to usher in a new world order through the establishment of a universal religion.

In purely religious terms, indeed, it was not so much Shiism as the rise and spread of Sufism that constituted the new and greatest challenge to Islamic orthodoxy, in terms of ideas and spiritual orientation, and indeed, it was Shiism that suffered most, in terms of following, as a result of the new movement. From modest beginnings as an expression of re-

finer piety on the part of a spiritual elite in the eighth and ninth centuries, Sufism became a mass religion from the eleventh century onward. In its origins as a deepening of the inner “life of the heart,” Sufism was largely complementary to the outer “life of the law,” which was the domain of the *‘ulamā*, the religious scholars who functioned as custodians of the *sharī‘ah* (sacred law) and never claimed to be pastors or custodians of the soul.

In its later development, however, through networks of brotherhoods that spread from the shores of the Atlantic to Southeast Asia, it practically took the place of “official” Islam, particularly in the countryside. Feeding on certain pantheistic ideas of eminent *Ṣūfīs* and generating latitudinarian, indeed protean, tendencies, it served to convert to Islam large populations in the Indian subcontinent, Central Asia, Africa, and Indonesia. A long line of orthodox *Ṣūfīs*, beginning in the eighth and ninth centuries and culminating in the monumental work of al-Ghazālī (d. 1111), struggled hard, with a good measure of success, to bring about a synthesis that would ensure a respectable place for *Ṣūfīs* spirituality in the orthodox fold. After the advent of Sufism, and particularly after al-Ghazālī’s success, the number of converts to Islam expanded dramatically, and the number of *Shī‘ah* shrank equally dramatically, apparently because the demands for an inner life that Shiism had satisfied through its esoteric claims were now satisfied by Sufism.

During the thirteenth and fourteenth centuries, Islam penetrated into the Malay archipelago largely through Arab traders, who went first to the coastal areas of Java and Sumatra and afterward to Malaysia. Shortly after the advent of Islam, however, these lands fell under western European domination. Because the structure of British power in Malaysia differed from Dutch colonialism in Indonesia, in that British overlordship was exercised through regional sultans whereas the Dutch ruled directly, Islam was inhibited in Indonesia: a large percentage of the population of the interior remained *abangans*, or “nominal Muslims,” whose life is still based on ancient custom (*‘ādāt*) under a thin Islamic veneer. Recently, however, a large-scale thrust of islamization has changed this picture considerably. In Djakarta, for example, a little more than a dozen years ago, there were only a few cathedral mosques for Friday services, but now the number has multiplied spectacularly; indeed, there is a mosque attached to every government department. This process of “consolidation in orthodox Islam,” necessitated by the initial compromises made by *Ṣūfīs* with local cultures, has been going on for some decades in the Indian subcontinent as well.

In Africa south of the Sahara, Islam appears to have penetrated through both traders and pilgrims. Although, as noted above, Islam spread there through the influence of *Ṣūfī* orders, one unique feature of African Islam seems to be the combination of Sufism with militancy, the latter acclaimed as the result of the Islamic teaching on *jihād*, although it is also congruent with the spirit of local tribalism.

Africa is the only continent where Muslims are in the majority, while in Europe, Islam now constitutes the second largest religion, mainly comprising emigrants from Muslim lands but a few Western converts as well. In North America, Muslims are said to number around two million, most of whom are emigrants from Muslim countries. But there is also in the United States a significant phenomenon of conversion among local blacks, originating in the social protest movement against white ascendancy. The earliest group, known as the Black Muslims, called itself the Nation of Islam during the lifetime of its founder, Elijah Muhammad, and was a heterodox movement. After his death in 1973 it moved closer to the rest of the Muslim community, taking the new name of American Islamic Mission and receiving financial help from oil-rich Arab countries such as Saudi Arabia, Libya, and Kuwait. (The organization was dissolved in 1985.) There are also other numerous, though small, Afro-American Muslim groups scattered throughout the United States.

Arriving at a precise estimate of the Muslim population in China presents a serious problem. According to data collected unofficially by Chinese Muslims in 1939–1940 and extrapolations from these data in terms of population growth, Chinese Muslims might number close to one hundred million in the 1980s. The official Chinese figure given in the early sixties, however, was ten million, a figure revised to between fifteen and twenty million two decades later (religion is a factor not counted in the Chinese census). According to the 1979 United Nations statistics, the world Muslim population is just under one billion.

THE SYSTEMATIC CONTENT OF ISLAM With the rise of Islamic legal and theological thought in the eighth century CE, a framework had to be articulated within which religious developments were to be set. The most basic sources in this framework were the *Qur’ān* and the *sunnah* of the Prophet.

The Qur’ān. The God of the *Qur’ān* is a transcendent, powerful, and merciful being. His transcendence ensures his uniqueness and infinitude over and against all other creatures, who are necessarily characterized by finitude of being and potentialities. Hence God is all-powerful, and no creature may share in his divinity (belief in such sharing is called *shirk* and is condemned in the *Qur’ān* as the most heinous and unforgivable sin). This infinite power is expressed, however, through God’s equally infinite mercy. The creation of the universe, the fact that there is plenitude of being, rather than emptiness of nothing, is due solely to his mercy. Particularly with reference to humanity, God’s creation, sustenance, guidance (in the form of revelations given to the prophets, his messengers), and, finally, judgment, are all manifestations of his power in mercy.

God created nature by his command “Be!” In fact, for whatever God wishes to create, “He says, Be! and there it is” (36:82). But whatever God creates has an orderly nature, and that is why there is a universe rather than chaos. God puts into everything the proper “guidance” or “nature” or laws of

behavior to make each part fit into the entire pattern of the universe. “All things are measured” (e.g., 54:49), and only God is the measurer; hence he alone is the commander, and everything else is under his command. This command, which is a fact of automatic obedience in the case of nature (3:83), becomes an “ought” in the case of humans, for whom moral law replaces natural law. Nature is, therefore, a firm, well-knit machine without rupture or dislocations.

Here it is interesting and important to note that while the Qurʾān patently accepts miracles of earlier prophets (67:2–3), in response to pressure from Muḥammad’s opponents for new miracles (e.g., 2:23, 10:38, 11:13), the Qurʾān insists that it is itself the Prophet’s miracle, and one that cannot be equaled. As for supernatural miracles, they are out of date because they have been ineffective in the past (17:59, 6:33–35). Nature is, therefore, autonomous but not autocratic, since it did not bring itself into being. God, who brought nature into being, can destroy it as well; even so, although the Qurʾān, when speaking of the Day of Judgment, often invokes a cataclysm that strongly suggests destruction (see, for example, *sūrah* 81), in many verses it speaks instead of a radical transformation and a realignment of the factors of life (e.g., 56:60–63). Finally, the universe has been created for the benefit of human beings, and all its forces have been “subjugated” to them; of all creatures, only they have been created to serve God alone (e.g., 31:20, 22:65).

In its account of the human race, while the Qurʾān holds that humans are among the noblest of God’s creatures and that Adam had indeed outstripped the angels in a competition for creative knowledge, a fact testifying to his unique intellectual qualities, it nevertheless criticizes them for their persistent moral failures, which are due to their narrow-mindedness, lack of vision, weakness, and smallness of self. All their ills are reducible to this basic deficiency, and the remedy is for them to enlarge the self and to transcend pettiness. This pettiness is often represented by the Qurʾān in economic terms, such as greed, fraud, and holding back from spending on the poor (as was the case with the Meccan traders): “If you were to possess [all] the treasures of the mercy of my lord, you would still sit on them out of fear of spending [on the needy]” (17:100). It is Satan who whispers into people’s ears that they would be impoverished by spending, while God promises prosperity for such investment (2:268). Instead of establishing usurious accounts to exploit the poor, believers should establish “credit with God” (2:245, 57:11, 57:18 et al.).

In its social doctrine and legislation, the Qurʾān makes a general effort to ameliorate the condition of the weak and often abused segments of society, such as the poor, orphans, women, and slaves. People are asked to free slaves on freedom-purchasing contracts, “and if they are poor, you give them from the wealth God has bestowed upon you” (24:33). An egalitarian statement concerning males and females is made, but the husband is recognized as “one degree higher” (2:228) because he earns by his strength and expends on his

wife. Polygamy is limited to four wives with the provision that “if you fear you cannot do justice [among them], marry only one” (4:3), and the further admonition that such justice is impossible “no matter how much you desire” (4:129). Kind and generous treatment of wives is repeatedly emphasized; celibacy is strongly discouraged, although not banned outright. The basic equality of all people is proclaimed and ethnic differences discounted: “O you people, we have created [all of] you from a male and a female, and we have made you into different nations and tribes [only] for the purpose of identification—otherwise, the noblest of you in the sight of God is the one who is the most righteous” (49:13).

In the economic field, the widespread practice of usury is prohibited. The *zakāt* tax is levied on the well-to-do members of the community; it was meant as a welfare tax to be spent on the poor and the needy in general, but *sūrah* 9:60, which details the distribution of *zakāt*, is so comprehensive in its scope that it covers practically all fields of social and state life. In general, fair play and justice are repeatedly advised. Detailed inheritance laws are given (4:7ff.), the main feature of which is the introduction of shares to daughters, although these shares are set at half of what sons receive. Communal affairs are to be decided through mutual consultation (*shūrā baynahum*, 42:38), a principle that has never been institutionalized in Islamic history, however.

One noteworthy feature of the moral teaching of the Qurʾān is that it describes all wrong done against anyone as “wrong done against oneself” (*ẓulm al-naḥs*, as in 2:231, 11:101, 11:118). In its teaching on the Last Judgment, the Qurʾān constantly talks of “weighing the deeds” of all adult and responsible humans (101:6–11, 7:8 et al.). This doctrine of the “weight” of deeds arises out of the consideration that people normally act for the here and now; in this respect, they are like cattle: they do not take a long-range or “ultimate” (*ākhirah*) view of things: “Shall we tell you of those who are the greatest losers in terms of their deeds? Those whose whole effort has been lost [in the pursuit of] this life [i.e., the lower values of life], but they think they have performed prodigies” (18:104). The rationale of the Last Judgment is to bring out the real moral meaning, “the weight” of deeds. But whereas the Last Judgment will turn upon individual performance, the Qurʾān also speaks about a “judgment in history,” which descends upon peoples, nations, and communities on the basis of their total performance and whether that performance is in accord with the teaching of the divine messages brought by their prophets: many nations have perished because of their persistence in all sorts of disobedience and moral wrong, for “God gives inheritance of the earth [only] to good people” (21:105).

The Qurʾān, therefore, declares unequivocally that God has sent his messages to *all* peoples throughout history and has left none without guidance (35:24, 13:7). These messages have been essentially the same: to reject *shirk* (associating anyone with God) and to behave according to the law of God. All messages have emanated from a single source,

the “Mother of All Books” (13:39) or the “Hidden Book” (56:78) or the “Preserved Tablet” (85:22), and although every prophet has initially come to his people and addressed them “in their tongue” (14:4), the import of all messages is universal; hence it is incumbent on all people to believe in all prophets, without “separating some from the others.” For this reason the Qurʾān is severely critical of what it sees as proprietary claims upon God’s guidance by Jews and Christians and rejects Jewish claims to special status in strong terms (62:6, 2:94–95, 5:18, et al.). Despite the identity of divine messages, moreover, the Qurʾān also posits some sort of development in religious consciousness and asserts that on the Last Day every community will be judged by the standards of its own book and under the witness of its own prophet(s) (4:41, 16:84, et al.). The Qurʾān protects, consummates, and transcends earlier revelations, and Muḥammad is declared to be the “seal of the prophets” (33:40).

Finally, the Qurʾān states five basic constituents of faith (*īmān*): belief in God, in angels, in revealed books, in God’s messengers, and in the Last Day. Corresponding to these five items of belief, a fivefold practical doctrine was formulated very early on. These “Five Pillars” include (1) bearing witness in public at least once in one’s lifetime that “There is no god but God and Muḥammad is his prophet”; (2) praying five times a day (before sunrise, early afternoon, late afternoon, immediately after sunset, and before retiring), while facing the Kaʿbah at Mecca; (3) paying *zakāt*; (4) fasting during Ramaḍān (the ninth month of the Islamic lunar year), with no eating, drinking, smoking, or sexual intercourse from dawn until sunset, when the daily fast is broken; and (5) performing the annual pilgrimage to the Kaʿbah at least once in one’s adult lifetime, provided one can afford the journey and leave enough provisions for one’s family.

The pilgrimage is performed during the first ten days of the last month of the Islamic year. One may perform the lesser pilgrimage (*ʿumrah*) at other times of the year, but it is not a substitute for the great pilgrimage (*al-ḥajj al-akbar*). The pilgrimage has, through the centuries, played an important role, not only in strengthening general unity in the global Muslim community but also in disseminating religious ideas both orthodox and Ṣūfī, for it provides the occasion for an annual meeting among religious leaders and scholars from different parts of the Muslim world. For the past few decades, it has also served to bring together political leaders and heads of Muslim states. In recent years, too, because of new travel facilities, the number of pilgrims has vastly increased, sometimes exceeding two million each year.

Sunnah. The word *sunnah* literally means “a well-trodden path,” but it was used before Islam in reference to usage or laws of a tribe and certain norms of intertribal conduct accepted by various tribes as binding. After the rise of Islam, it was used to denote the normative behavior of the Muslim community, putatively derived from the Prophet’s teaching and conduct, and from the exemplary teaching of his immediate followers, since the latter was seen as an index

of the former. In the Qurʾān, there is no mention of the term *sunnah* with reference to the Prophet’s extra-Qurʾanic precepts or example, but the term *uswah ḥasanah*, meaning a “good model” or “example” to be followed, is used with reference to Muḥammad’s conduct as well as the conduct of Abraham and his followers (33:31, 60:4, 60:6). The term *uswah* is certainly much less rigid than *sunnah* and does not mean so much a law to be literally implemented as an example to be matched.

Even so, there is clear evidence that the concept of *sunnah* was flexible in the early decades of Islam because, with hardly any written codifications of the *sunnah* (which was used in the sense of an ongoing practice rather than fixed formulas), there was no question of literal imitation. As political, legal, and theological dissensions and disputes multiplied and all kinds of positions sought self-validation, however, the opinions of the first three generations or so were projected back onto the Prophet to obtain the necessary authority, and the phrase *sunnat al-nabī* (the *sunnah* of the Prophet) gradually took the place of the term *sunnah*.

During the second and third centuries AH, the narration and codification of the *sunnah* into *ḥadīth* was in full swing. A report that claims to convey a *sunnah* (or *sunnahs*) is called a *ḥadīth*. It is reported that while earlier people used to accept a *ḥadīth* as genuine on trust alone, after the civil wars of the late first to early second centuries AH, a *ḥadīth* was accepted only on the basis of some reliable authority. From this situation emerged the convention of the *isnād*, or the chain of guarantors of *ḥadīth*, extending from the present narrator backward to the Prophet. The *isnād* took the following form: “I, So-and-so, heard it from B, who heard it from C, who said that he heard the Prophet say so-and-so or do such-and-such.” Then followed the text (*matn*) of the *ḥadīth*. A whole science called “principles of *ḥadīth*” developed in order to lay down meticulous criteria for judging the reliability of the transmitters of *ḥadīth*, and the discipline stimulated in turn a vast literature of comprehensive biographical dictionaries recording thousands of transmitters’ names, their lives, character, and whether a transmitter actually met or could have met the person he claims to transmit from. The canons for criticizing transmitters were applied rigorously, and there is hardly a transmitter who has escaped criticism.

The experts on *ḥadīth* also developed canons of “rational critique” alongside the critique of the chains of transmission, but they applied the former with far less rigor than they did the latter. Although the specialists divided *ḥadīth* into several categories according to their “genuineness” and “reliability,” to this day it remains the real desideratum of the science to work out and apply what is called historical criticism to the materials of *ḥadīth*. The six authoritative Sunnī collections of *ḥadīth* date from the third century AH, while the famous Shīʿī collection of al-Kulīnī, *Al-kāfi* (The Sufficient), dates from the early fourth century. In modern times, the authenticity of *ḥadīth* and hence of the recorded *sunnah* of the Prophet (although not so much the biographies of the

Prophet and historical works) has come under general attack at the hands of certain Western scholars and also of some Muslim intellectuals—and this is happening increasingly—but the ‘*ulamā*’ have strenuously resisted these attacks because a large majority of Islamic social and political institutions and laws are either based on *ḥadīth* or rationalized through it.

Law. The well-known dictum among Western Islamists that, just as theology occupies the central place in Christianity, in Islam the central place belongs to law is essentially correct. Law was the earliest discipline to develop in Islam because the Muslims needed it to administer the huge empire they had built with such astonishing rapidity. Recent research has held that the early materials for Islamic law were largely created by administrators on the basis of *ad hoc* decisions and that, in the second stage, systematic efforts were made by jurists to “islamize” these materials and bring them under the aegis of the Qurʾān and the *sunnah*. (The content of the latter, in the form of *ḥadīth*, developed alongside this activity of islamization.) This picture is probably too simplistic, however, and it would be more correct to say that the process of subsuming administrative materials and local custom under the Qurʾān and the *sunnah* went hand in hand with the reverse process of deriving law from the Qurʾān and whatever existed by way of the *sunnah* in the light of new administrative experiences and local custom.

Although clarification of this issue requires further research, it is certain that up to the early third century AH the schools of law were averse to the large-scale use of *ḥadīth* in the formulation of law and that, in fact, some scholars explicitly warned against the rise of “peripheral *ḥadīth*” and advised the acceptance of only that *ḥadīth* that conformed to the Qurʾān. However, the need for the anchoring authority of the Prophet had become so great that in the latter half of the second century AH al-Shāfiʿī (d. 204/819) made a strong and subsequently successful bid for the wholesale acceptance of “reliable” *ḥadīth*—even if narrated by only one person. As a result, *ḥadīth* multiplied at a far greater rate after al-Shāfiʿī than before him. Nevertheless, the followers of Abū Ḥanīfah (d. 767) continued to reject a single-chain *ḥadīth* in favor of a “sure, rational proof derived from the *sharīʿah* principles,” just as the followers of Mālik (d. 795) continued to give preference to the early “practice of Medina” over *ḥadīth*.

The final framework of Islamic jurisprudence came to recognize four sources of law, two material and two formal. The first source is the text of the Qurʾān, which constitutes an absolute “decisive proof”; the second is *ḥadīth* texts, although these can vary from school to school, particularly between the Sunnī and the Twelver Shīʿī schools. In new cases, for which a “clear text” (*naṣṣ*) is not available, a jurist must make the effort (*ijtihād*) to find a correct answer himself. The instrument of *ijtihād* is analogical reasoning (*qiyās*), which consists in (1) finding a text relevant to the new case in the Qurʾān or the *ḥadīth*, (2) discerning the essential similarity or *ratio legis* (called ‘*illat al-ḥukm*) between the two cases, (3)

allowing for differences (*furūq*) and determining that they can be discounted, and (4) extending or interpreting the *ratio legis* to cover the new case. This methodology, although neatly formulated in theory, became very difficult to wield in practice primarily because of the differences of opinion with regard to “relevant texts,” particularly in the case of *ḥadīth*.

The fourth source or principle is called *ijmāʿ*, or consensus. Although the concept of consensus in the sense of the informal agreement of the community (for Islam has no churches and no councils to produce formal decisions) has in practice an overriding authority, since even the fact and the authenticity of a Qurʾanic revelation are finally guaranteed by it, there is no consensus on the definition of consensus: it varies from the consensus of the ‘*ulamā*’, through that of the ‘*ulamā*’ of a certain age, to that of the entire community. There is also a difference of opinion as to whether a certain consensus can be repealed by a subsequent one or not; the reply of the traditionalists is usually, though not always, in the negative, while that of modern reformers is in the positive.

A special category of punishments called *ḥudūd* (sg., *ḥadd*) was established by jurists and includes penalties specified in the Qurʾān for certain crimes: murder, theft, adultery, and false accusation of adultery, to which was later added drunkenness. The theory is that since God himself has laid down these penalties, they cannot be varied. But in view of the severity of the punishments, the jurists defined these crimes very narrowly (adultery, for example, is defined as the penetration of the male organ into the female) and put such stringent conditions on the requisite evidence that it became practically unattainable (for example, in order to prove adultery, four eyewitnesses to the sexual act itself were required). The legal maxim “Ward off *ḥadd* punishments by any doubt” was also propounded, and the term *doubt* in classical Islamic law had a far wider range than in any other known system of law. In addition, Muslim jurists enunciated two principles to create flexibility in *sharīʿah* law and its application: necessity and public interest. The political authority, thanks to these two principles, could promulgate new measures and even suspend the operations of the *sharīʿah* law. In later medieval centuries, the Ottoman rulers and others systematically promulgated new laws by invoking these particular principles of the *sharīʿah*.

After the concrete and systematic establishment of the schools of law during the fourth and fifth centuries AH, original legal thought in Islam lost vitality; this development is known as “the closure of the door of *ijtihād*.” It was not that new thinking was theoretically prohibited but rather that social, intellectual, and political conditions were unfavorable to it. However, a procedure known as *talfīq* (lit., “patchwork”) was introduced whereby, if a certain provision in one legal school caused particular hardship, a more liberal provision from another could be borrowed, without necessarily taking over its reasoning. Thus, given the impracticality of the Ḥanafī school’s regulation that a wife whose husband has

disappeared must wait more than ninety years before remarriage (according to the reasoning that the wife must wait until her husband can be presumed dead through natural causes), the Mālikī school's provision that such a wife may marry after four years of waiting (Mālik reasoned that the maximum period of gestation, which he had himself witnessed, was four years) was taken over in practice.

Of the four extant Sunnī schools of law, the Ḥanafī is prevalent in the Indian subcontinent, Central Asia, Turkey, Egypt, Syria, Jordan, and Iraq; the Mālikī school in North Africa extends from Libya through Morocco; the Shāfi'ī, in Southeast Asia, with a considerable following in Egypt; and the Ḥanbalī school, in Saudi Arabia. Within Shī'ī jurisprudence, the Ja'farī (Twelver Shī'ī) school prevails in Iran. At one time, the "literalist" (Zāhiri) school was represented by some highly prominent jurists, but it has practically no following now, while the Khārijī school is represented in Oman, and to a limited extent in East and North Africa.

It must finally be pointed out that when we speak of Islamic law, we mean all of human behavior, including, for example, intentions. This law is therefore very different from other systems of law in the strict sense of the term. Islamic law does not draw any line between law and morality, and hence much of it is not enforceable in a court, but only at the bar of conscience. This has had its advantages in that Islamic law is shot through with moral considerations, which in turn have given a moral temper to Muslim society. But it has also suffered from the disadvantage that general moral propositions have very often not been given due weight and have been selectively construed by jurists as mere "recommendations" rather than commands that must be expressed in terms of concrete legislation: the result has been an overemphasis on the specific dos and don'ts of the Qur'ān at the expense of general propositions. For example, the Qur'anic verse 4:3, permitting polygamy up to four wives, was given legal force by classical Muslim jurists, but the rider contained in the same verse, that if a person cannot do justice among co-wives, then he must marry only one, was regarded by them as a recommendation to the husband's conscience that he should do justice.

Theology. At an elementary level, theological speculation in Islam also began very early and was occasioned by the assassination of 'Uthmān, the third caliph (d. 665), but its rise and development was totally independent of the law, and the first great theological systems were constructed only in the third and fourth centuries AH. The first question to become the focal point of dispute was the definition of a true Muslim. The earliest political and theological schism was represented by the Khārijīs (from *khurūj*, meaning "secession"), who contended that a Muslim ceases to be a Muslim by the commission of a single serious sin such as theft or adultery, no matter how many times that person may recite the profession of faith, "There is no god but God and Muḥammad is his prophet," unless he or she repents sincerely. They held that 'Uthmān and 'Alī (the fourth caliph) had

both become *kāfir*s (non-Muslims), since the former was guilty of serious maladministration, including nepotism, and the latter had submitted his claim to rule to human arbitration, even though he had been duly elected caliph. The Khārijīs, who were exemplars of piety and utterly egalitarian, and who believed that the only qualification for rule is a person's goodness and piety, without consideration of race, color, or sex, were mostly bedouin, which largely explains both their egalitarianism and their fanaticism. They were "professional rebels" who never united but always fought successive governments in divided groups and were almost entirely crushed out of existence by the middle of the second century AH.

While the Khārijīs were not a systematic theological school, a full-fledged school, that of the Mu'tazilah, soon developed from their milieu. These thinkers, who emerged during the second and third centuries AH, held that while grave sinners do not become *kāfir*s, neither do they remain Muslims. Their central thesis concerned what they called "God's justice and unity," which they defended to its logical conclusion. God's justice demands that human beings have a free and efficacious will; only then can they be the locus of moral responsibility and deserve praise and blame here and reward and punishment in the hereafter. They carried this belief to the point of holding that just as God, in his justice, cannot punish one who does good, neither can he forgive one who does evil, for otherwise the difference between good and evil would disappear. This position certainly offended religious sensitivities, since the Qur'ān repeatedly mentions that God will forgive "whom he will" (2:284, 3:129 et al.).

For the Mu'tazilah, God plays no role in the sphere of human moral acts, except that he gives man moral support provided man does good by himself; God's activity is limited to nature. All anthropomorphic statements in the Qur'ān were interpreted by the Mu'tazilah either as metaphors or as Arabic idioms. They rejected *ḥadīth* outright because much of it was anthropomorphic and refused to base law upon it on the ground that *ḥadīth* transmission was unreliable. They further held that good and evil in terms of general principles (but not the positive religious duties) were knowable by human reason without the aid of revelation but that revelation supplied the necessary motivation for the pursuit of goodness. In conformity with this view, they believed that one must rationally ponder the purposes of the Qur'anic ordinances, for in laying these down, God had a positive interest in furthering human well-being (*maṣlahah*). This presumably means that law should be rationally grounded; there is, however, no evidence that the Mu'tazilah ever attempted to work out a legal system.

On the issue of God's unity, the Mu'tazilah rejected the separation of God's attributes from his essence, for this would entail belief in a multiplicity of eternal beings, amounting to polytheism. They did not deny that God is "living," "knowing," and "willing," as divine activities, but they denied that God is "life," "knowledge," and "will," as

substantives. The development of this particular doctrine was possibly influenced by Christian discussions on the nature of the Trinity, and how and whether three hypostases could be one person, because the terms in which it is formulated are all too foreign to the milieu of pristine Islam. As a consequence of this doctrine, the Muʿtazilah also denied the eternity of the Qurʾān, the very speech of God, since they denied the substantiality of all divine attributes. When their credo was made state creed under Caliph al-Maʿmūn, they persecuted opposition religious leaders such as Ibn Ḥanbal (d. 855), but because of these very doctrines—denial of God’s forgiveness and of the eternity of the Qurʾān—they became unpopular, and Caliph al-Mutawakkil (d. 861) brought Sunnism back to ascendancy.

What is in fact called Sunnism means nothing more than the majority of the community; it had its content defined in large measure as a reaction to the Khārijīs and the Muʿtazilah, for Sunnī orthodoxy is but a refined and sophisticated form of that popular reaction that crystallized against these groups. There, no small role was played by popular preachers and popular piety, which had already found its way into *ḥadīth*. In doctrinal form, this reaction can be described as Murjiʿism (from *irjāʿ*, “postponement”), the belief that once adults have openly professed that there is no God but Allāh and Muḥammad is his prophet, if there is no reason to suspect that they are lying, mad, or under constraint, then such people are Muslims, irrespective of whether their deeds are good or whether their beliefs quite conform to orthodoxy, and that final judgment on their status must be “postponed” until the Last Day and left to God.

In conscious opposition to the Khārijīs and the Muʿtazilah, the Murjiʿah were content with minimal knowledge of Islam and Islamic conduct on the part of a believer. On the question of free will, they leaned heavily toward predestinarianism, and some were outright predestinarians. There is evidence that the Umayyad rulers supported the Murjiʿah, apparently for their own political ends, since they were interested in discouraging questions about how they had come to power and set up a dynastic rule that abandoned the first four caliphs’ model and high moral and political standards. However, it would have been impossible for these rulers to succeed if popular opinion had not swung toward the Murjiʿah, particularly in reaction against the Khārijīs.

The chief formulator of the Sunnī creed was Abū al-Ḥasan al-Ashʿarī (d. 935), a Muʿtazilī who later came under the influence of the traditionists (*ahl al-ḥadīth*) and turned the tables on his erstwhile preceptor and fellows among the Muʿtazilah. For al-Ashʿarī, people cannot produce their own actions; rather, God does, and neither man nor nature has any powers or potencies before the actual act. At the time of the act, for example, when fire actually burns, God creates a power for that particular act. Thus God creates an action, while human beings “appropriate” or “acquire” (*kasaba*) it and thereby become responsible for “their” acts. The Ashʿarī theologians are, therefore, atomists in terms of

both time and space, and they reject causation and the entire idea of movement or process. God is under no obligation to do what human beings call justice; on the contrary, whatever God does is just. Justice involves reference to certain norms under which the agent works; since God has no norms to obey, there is no question of doing justice on his part. He also promised in the Qurʾān that he will reward those who do good and punish those who do evil, and this is the proper and only assurance we have of the fate of human beings; if he had chosen to do the reverse, no one could question him. It also follows that good and bad are not natural characteristics of human acts, but that acts become good or bad by God’s declaration through the revelation that he has been sending since Adam, the first prophet. It is, therefore, futile to probe rationally into the purposes of divine injunctions, for these are the result of God’s will.

On the question of divine attributes, al-Ashʿarī taught that these are real, although they are “neither God, nor other than God.” God has an eternal attribute of “speech,” which al-Ashʿarī called “psychic speech,” manifested in all divinely revealed books. Although the Qurʾān as God’s “psychic speech” is eternal, as something recited, written, and heard it is also created: one cannot point to a written copy of the Qurʾān or its recital and say “This is eternal.”

A contemporary of al-Ashʿarī, the Central Asian theologian al-Māturīdī (d. 944), also formulated an “official” Sunnī creed and theology that in some fundamental ways was nearer to the Muʿtazilī stance. He recognized “power-before-the-act” in man and also declared good and bad to be natural and knowable by human reason. Whereas al-Ashʿarī belonged to the Shāfiʿī school of law, which was based principally on *ḥadīth*, al-Māturīdī was a member of the Ḥanafī school, which gave greater scope to reason. Yet, in subsequent centuries, the former’s views almost completely eclipsed the latter’s, although in the Indian subcontinent such prominent thinkers as Aḥmad Sirhindī (d. 1624) and Shāh Walī Allāh of Delhi (d. 1762) criticized Ashʿarī theology. The reason behind this sweeping and enduring success of Ashʿarī theology seems to be the overwhelming spread of Sufism (particularly in its pantheistic form), which, in theological terms, was much more akin to Ashʿarī thought than to that of Muʿtazilī or even the Māturīdīyah, in that it sought to obliterate the human self in the all-embracing and all-effacing self of God, the most important nodal point of this conjunction being al-Ghazālī.

In the intellectual field, as we shall see, Sufism grew at the expense of theology and utilized the worldview of the Muslim philosophers. On the moral and spiritual planes, however, the powerful corroboration of theology and Sufism stimulated the vehement reaction of the jurist and theologian Ibn Taymīyah (d. 1328). Struggling all his life against popular Ṣūfī superstitions, against worship of saints and their shrines, and against Ashʿarī theology, he tried to resurrect the moral activism of the Qurʾān and the *sunnah*. He regarded the Muʿtazilī denial of God’s role in human actions as an

error but considered the Ash‘arī denial of human free and effective will as extremely dangerous and, in fact, stated that pantheistic Šūfīs and the Ash‘arī theologians were considerably worse than not only the Mu‘tazilah but even the Zoroastrians. He held that the Zoroastrians’ postulation of two gods was undoubtedly an error but argued that they had been forced into this belief by the undeniable distinction between good and evil that both Ash‘arī theology and pantheistic Sufism virtually obliterated, leaving no basis for any worthwhile religion. (As we shall see, a similar argument was conducted within Sufism by a later Indian Šūfī, Aḥmad Sirhindī.) Ibn Taymīyah sought to solve the perennial problem of free will versus divine omnipotence by saying that the actual application of the principle of divine omnipotence occurs only in the past, while the *sharī‘ah* imperatives are relevant only to the future. His teaching remained more or less dormant until the eighteenth century, when it inspired the Wahhābī religious revolution in the Arabian Peninsula.

Sufism. The mainspring of Sufism lay in the desire to cultivate the inner life and to attain a deeper, personal understanding of Islam. Among the many proposed etymologies of the word *šūfī*, the most credible is the one that derives it from *šūf*, meaning “coarse wool,” a reference to the kind of garb that many Šūfīs wore. The first phase of this spiritual movement was definitely moral, and the works of most early Šūfīs, those of the second and third centuries AH, show a preoccupation with constant self-examination and close scrutiny of one’s motivation.

Šūfī doctrine. The dialectic of the trappings and self-deception of the soul developed by Ḥakīm al-Tirmidhī (d. 898) in his *Khawṣ al-awliyā‘* (The seal of the saints) provides one extraordinary example of spiritual insight, but this strongly moral trend continues from Ḥasan al-Baṣrī (d. 728) through al-Muḥāsibī (d. 857) to his pupil al-Junayd (d. 910). The essence of their doctrine is moral contrition and detachment of the mind from the “good things” of the world (*zuhd*). But from its very early times, Sufism also had a strong devotional element, as exemplified by the woman saint Rābī‘ah al-‘Adawīyah (d. 801). The goal of love of God led to the doctrine of *fanā‘* or “annihilation” (that is, of the human self in God). There were definitely Hellenistic Christian influences at work here. But the annihilation ideal was soon amended into “survival (*baqā‘*) after annihilation,” or (re)gaining of a new self, and this formula was given different interpretations.

Most Šūfīs taught that, after the destruction of the human attributes (not the self), mortals acquire divine attributes (not the divine self) and “live in” them. The firm view of the orthodox and influential Šūfīs al-Junayd was that when a person sheds human attributes and these attributes undergo annihilation, that person comes to think that he or she has become God. But God soon gives that person the consciousness of otherness (not alienation) from God, which is extremely painful and is only somewhat relieved by God’s also giving the consolation that this is the highest state attain-

able by human beings. Yet there were also Šūfīs who, most probably under the influence of Hellenistic Christianity, believed in human transubstantiation into God. In 922, al-Ḥallāj, a representative of this school, was charged with having uttered the blasphemous statement “I am God” and was crucified in Baghdad. Yet, a somewhat earlier mystic, al-Biṣṭāmī (d. 874), who is said to have committed even graver blasphemies, was never touched by the law. It may be, as some contend, that the real reasons behind al-Ḥallāj’s execution were political, or it may be related to the fact that al-Ḥallāj was in the capital, Baghdad, whereas al-Biṣṭāmī lived in an outlying province.

This example of such divergent interpretations of a fundamental doctrine should warn us that with Sufism we are dealing with a truly protean phenomenon: not only do interpretations differ, but experiences themselves must differ as well. However, under pressure from the ‘ulamā’, who refused to acknowledge any objective validity for the Šūfī experience, the Šūfīs formulated a doctrine of “spiritual stations” (*maqāmāt*) that adepts successively attained through their progressive spiritual itinerary (*sulūk*). These stations are as objectifiable as any experience can be. Although the various schools have differed in the lists of these stations, they usually enumerate them as follows: detachment from the world (*zuhd*), patience (*ṣabr*), gratitude (*shukr*) for whatever God gives, love (*ḥubb*), and pleasure (*riḍā*) with whatever God desires.

After the violent death of al-Ḥallāj, another important doctrine of the dialectic of Šūfī experience was developed by orthodox Šūfīs. According to this doctrine, the Šūfī alternates between two different types of spiritual states. One type is the experience of unity (where all multiplicity disappears) and of the inner reality. In this state the Šūfī is “absent” from the world and is “with God”; this is the state of “intoxication” (*sukr*). The other state, that of “sobriety” (*ṣaḥw*), occurs when the Šūfī “returns” to multiplicity and is “with the world.” Whereas many Šūfīs had earlier contended that “intoxication” is superior to “sobriety” and that, therefore, the saints (*awliyā‘*) are superior to the prophets (who are “with the world” and legislate for society), the orthodox Šūfīs now asserted the opposite, for the goodness of saints is limited to themselves, whereas the goodness of prophets is transitive, since they save the society as well as themselves.

On the basis of this doctrine, al-Ḥallāj’s famous statement was rationalized as “one uttered in a state of intoxication” and as such not to be taken at face value. But it was al-Ghazālī who effected a meaningful and enduring synthesis of Šūfī “innerism” and the orthodox belief system. A follower of al-Ash‘arī in theology and of al-Shāfi‘ī in law, al-Ghazālī also studied thoroughly the philosophic tradition of Ibn Sīnā (known in the West as Avicenna, d. 1037), and although he refuted its important theses bearing on religion in the famous work *Tabāfiṭ al-falāsifah* (The Incoherence of the Philosophers), he was influenced by it in important ways as well. He then adopted Sufism as his “way to God” and

composed his *magnum opus*, *Ihyā' 'ulūm al-dīn* (The Revivification of the Sciences of the Faith). His net accomplishment lies in the fact that he tried to infuse a new spiritual life into law and theology on the one hand and to instill sobriety and responsibility into Sufism on the other, for he repudiated the Ṣūfī *shataḥāt* (intoxicated utterances) as meaningless.

Within a century after al-Ghazālī's death, however, a Ṣūfī doctrine based on out-and-out monism was being preached by Ibn al-'Arabī (d. 1240). Born in Spain and educated there and in North Africa, Ibn al-'Arabī eventually traveled to the Muslim East; he lived for many years in Mecca, where he wrote his major work, *Al-futūḥāt al-makkīyah* (The Meccan Discoveries), and finally settled in Damascus, where he died. Ibn al-'Arabī's writings are the high-water mark of theosophic Sufism, which goes beyond the ascetic or ecstatic Sufism of the earlier period, by laying cognitive claims to a unique, intuitive experience (known as *kashf*, "direct discovery," or *dhawq*, "taste") that was immune from error and radically different from and superior to the rational knowledge of the philosophers and the theologians.

Ibn al-'Arabī's doctrine, known as Unity of Being (*waḥdat al-wujūd*), teaches that everything is in one sense God and in another sense not-God. He holds that, given God, the transcendent, another factor that in itself is not describable "either as existent or as nonexistent" comes to play a crucial role in the unfolding of reality. This factor is neither God nor the world; it is a "third thing," but it is God with God and world with the world. It is the stuff of which both the attributes of God (for God as transcendent has no names and no attributes) and the content of the world are made. It is eternal with the eternal and temporal with the temporal; it does not exist partially and divided in things: the whole of it is God, and the whole of it is the world, and the whole of it is everything in the world. This "third thing" turns out finally to be the Perfect or Primordial Human Being (who is identified with the eternal, not the temporal, Muḥammad), in whose mirror God sees himself and who sees himself in God's mirror. This immanent God and Human Being are not only interdependent but are the obverse and converse of the same coin. There is little doubt that Ibn al-'Arabī represents a radical humanism, a veritable apotheosis of humanity.

This monistic Sufism found certain devoted and distinguished exponents in Ibn al-'Arabī's school, in both prose and poetry, the most illustrious and influential representative of the latter being Jalāl al-Dīn Rūmī (d. 1273), whose *Mathnavī* in Persian has been hailed as the "Qur'an in the Persian language." Through poetry, moreover, it has had a profound and literally incalculable influence on the general intellectual culture of Islam, in terms of a liberal humanism, indeed, latitudinarianism, and among the lower strata of Islamic society even antinomianism. A striking feature of this antinomianism, where orthodoxy was unashamedly scoffed at and ridiculed for its rigidity and narrow confines, is that

it was tolerated by the orthodox only when it was expressed in poetry, not in prose. Also, because of the latitude and broad range of Ṣūfī spirituality, from roughly the twelfth century to the impact of modernization in the nineteenth century, the more creative Muslim minds drifted from orthodoxy into the Ṣūfī fold, and philosophy itself, although it remained rational in its methods, became mystical in its goals.

I have already noted the severe reaction against Ṣūfī excesses on the part of Ibn Taymīyah in the fourteenth century. It may be mentioned here that for Ibn Taymīyah the ultimate distinction between good and evil is absolutely necessary for any worthwhile religion that seeks to inculcate moral responsibility, and further, that this distinction is totally dependent upon belief in pure monotheism and the equally absolute distinction between man and God. He sets little value on the formal fact that a person belongs to the Muslim community; he evaluates all human beings on the scale of monotheism. Thus, as seen above, he regards pantheistic Ṣūfīs (and, to a large extent, because of their predestinarianism, the Ash'arīyah as well), as being equivalent to polytheists; then come the Shī'ah and Christians because both consider a human being to be a divine incarnation; and last come Zoroastrians and the Mu'tazilah, since both posit two ultimate powers.

Later, the Indian shaykh of the Naqshbandī order, Aḥmad Sirhindī (d. 1624), undertook a similar reform of Sufism from within. His massive *Maktūbāt-i Aḥmad Sirhindī* (Letters), the main vehicle of his reform, besides the training of disciples, was twice translated into Ottoman Turkish and was influential in Turkey; in the Arab Middle East, his reformist thought was carried and spread in the nineteenth century. Sirhindī, who accepts Ibn al-'Arabī's philosophical scheme at the metaphysical level, introduces a radical moral dualism at the level of God's attributes and, instead of identifying the temporal world with the stuff of divine attributes, as Ibn al-'Arabī does, regards that world as being essentially evil, but evil that has to be transformed into good through the activity of the divine attributes. The basic error of the common Ṣūfīs, for him, is that instead of helping to transform this evil into good, as God wants to do through his attributes, they flee from it. The spiritual heights to which they think they are ascending are, therefore, a pure delusion, for the real good is this evil, "this earth," once it has been transformed. But this realization requires a constant struggle with evil, not a flight from it. It is a prophet, then, not a saint, who undertakes the real divine task, and the true test of a person's ascent to real spiritual heights is whether he or she reenters the earth in order to improve and redeem it. Despite the efforts of Ibn Taymīyah, Sirhindī, and other figures, however, Ibn al-'Arabī's influence has been, until today, very strong in the Muslim world, not just on Sufism but on Islamic poetry as well.

Ṣūfī orders. Up to the twelfth century, Sufism was a matter of limited circles of a spiritual elite that might be aptly

described as “schools” with different spiritual techniques and even different spiritual ideologies. From the twelfth century on, however, they developed into networks of orders, involving the masses on a large scale. Systems of Ṣūfī hospices—called variously *zāwiyaḥs* (in Arabic), *tekkes* (in Turkish), and *khānagāḥs* (in Iran and the Indian subcontinent)—where the Ṣūfī shaykh lived (usually with his family in the interior of the building) and guided his clientele, grew up from Morocco to Southeast Asia. Although in some of the hospices orthodox religious disciplines such as theology and law were taught along with Ṣūfī works, orthodox education was generally carried on in the *madrasaḥs*, or colleges, while only Ṣūfī works were taught in the Ṣūfī centers.

Ṣūfī orders can be divided into those that are global and those that are regional. The most global is the Qādirī order, named after ‘Abd al-Qādir al-Jīlānī (d. 1166), with branches all over the world that are tied only loosely to the center at Baghdad. Somewhat more regional are the Suhrawardī and the Naqshbandī orders. The latter, which originated in Central Asia in the thirteenth century, formulated an explicit ideology early in its career to try to influence the rulers and their courts, with the result that they have often been politically active. One of its branches, the Khalwatīyah, played a prominent role in modernizing reform in Turkey during the eighteenth and nineteenth centuries. Several of the Ṣūfī orders have been associated with guilds and sometimes, particularly in Ottoman Turkey, have been directly involved in social protests and political rebellions against official oppression and injustice.

Another broad and important division is that between urban and “rustic” orders. The former, particularly the Naqshbandī order and its offshoots, were refined and close to the orthodoxy of the ‘*ulamā*’, with the result that an increasingly large number of the ‘*ulamā*’ gradually enrolled themselves in these urban Ṣūfī orders, particularly the orthodox ones. By contrast, many of the rustic orders were without discipline and law (*bī-shar‘*), especially in the Indian subcontinent, where they were often indistinguishable from the Hindu *sādhūs* (monks). With the spread of modernization, Sufism and Ṣūfī orders have suffered greatly; in Turkey, they were suppressed by Mustafa Kemal Atatürk in the 1920s, and their endowments were confiscated by the government. It is interesting to note, however, that since the mid-twentieth century some orders have experienced a revival in the industrial urban centers of Muslim lands, probably in reaction to the excessively materialistic outlook generated by modernization, while in Central Asia their underground networks are waging anti-Soviet activities in an organized manner. Correspondingly, in the West, several intellectuals, such as Frithjof Schuon and Martin Lings, have actively turned to Ṣūfī devotion to escape the spiritual vacuity created by their own overly materialistic culture.

Sects. There are two broad divisions within the Muslim community, the Sunnīs and the Shī‘ah. The theological views and the legal schools of the Sunnīs—the majority of

the community—have been dealt with above. The Shī‘ī schism grew out of the claim of the Shī‘ah (a word meaning “partisans,” in this context “the partisans of ‘Alī”) that following the Prophet, rule over Muslims belongs rightfully only to ‘Alī, Muḥammad’s cousin and son-in-law, and to his descendants. This doctrine, known as “legitimation,” was opposed to the Khārījī view that rule is open to any good Muslim on a universal basis and to the Sunnī view, which was no more than a rationalization of actual facts, that “rulers must come from the Quraysh,” the Prophet’s tribe, but not necessarily from his clan or house.

The Shī‘ah, in early Islam, were primarily sociopolitical dissidents, sheltering under the umbrella of “the house of the Prophet” but actually representing various elements of social protest against Umayyad Arab heavy-handedness and injustices. But it was not long before they began establishing an ideological and theological base for themselves. Until well into the third century AH, Shī‘ī theology was crude and materialistic: it asserted that God was a corporeal being who sat on an actual throne and created space by physical motion. Hishām ibn al-Ḥakam (d. 814?), among the best known of the early Shī‘ī theologians, is reported to have said that God was “a little smaller than Mount Abū Qabīs.” There were several other early Shī‘ī theologians who attributed some kind of body, including a physical body, to God, but beginning in the latter half of the ninth century, Shī‘ī theology was radically transformed, inheriting and asserting with increasing force the Mu‘tazilī doctrine of human free will against the Sunnīs.

In the thirteenth century CE, through the work of the philosopher, theologian, and scientist Naṣīr al-Dīn Ṭūsī (d. 1273), philosophy entered Shī‘ī theology, a process that was further facilitated by Ṭūsī’s student, the influential theologian al-Ḥillī (d. 1325). In his work on the creed, *Tajrīd al-‘aqā’id* (Concise Statement of the Creeds), which was subsequently commented upon by both Shī‘ī and Sunnī theologians, Ṭūsī describes man as “creator of his own actions.” Ṭūsī, however, rejects the philosophical thesis of the eternity of the world. Here it is interesting to compare this Shī‘ī development with the Sunnī position that was articulated about three-quarters of a century earlier at the hands of Fakhr al-Dīn al-Rāzī (d. 1209), who expanded the official Sunnī theology by incorporating into it a discussion of major philosophical themes. But whereas the Shī‘ah accepted many philosophical theses into their theology, al-Rāzī and other Sunnīs after him refuted all the philosophical theses point by point, thus erecting a theology that was an exclusive alternative to philosophy. Against this background is probably to be understood the fact that while philosophy was exercised from the curricula in the Arab world from the thirteenth century on and declined sharply in the rest of the Sunnī world, it reached its zenith in Shī‘ī Iran in the seventeenth century and continues unabated until today, although many of the orthodox Shī‘ah continue to oppose it.

In law, the Twelver Shī‘ī school has long been recognized as valid by the Sunnīs, despite differences, the most

conspicuous being that Shī'ī law recognizes a temporary marriage that may be contracted for a fixed period—a year, a month, a week, or even a day. Among the Shī'ah, the nearest school to Sunnism, particularly in law, is that of the Zaydīyah in Yemen, whose founder Zayd ibn 'Alī (d. 738), a brother of the fifth imam of the Shī'ah, was a theology student of the first Mu'tazilī teacher, Wāṣil ibn 'Aṭā' (d. 748).

But the most characteristic doctrine of the Shī'ah is their esotericism. This has a practical aspect called *taqīyah*, which means dissimulation of one's real beliefs in a generally hostile atmosphere. This doctrine, apparently adopted in early Islamic times, when the Shī'ah became a subterranean movement, as it were, in the wake of political failure, subsequently became a part of Shī'ī dogma. But in its theoretical aspect esotericism is defined by the doctrine that religion, and particularly the Qur'ān, has, besides the apparent, "external" meaning, hidden esoteric meanings that can be known only through spiritual contact with the Hidden Imam. In the early centuries of Islam, this principle of esotericism was probably unbridled and fanciful in its application, as is apparent from the ninth- to tenth-century Qur'ān commentary of al-Qummī. But as Shiism was progressively permeated by rational thought, esotericism became more systematic, even if it may often seem farfetched (as in certain philosophical interpretations of the Qur'ān). As pointed out earlier, the Ṣūfīs also patently practiced esotericism in understanding the materials of religion, particularly the Qur'ān; the ultimate common source of both Shiism and Sufism lies in Gnosticism and other comparable currents of thought, and, indeed, Ibn al-'Arabī's interpretations are often purely the work of his uncontrolled imagination.

Beginning from about the middle of the tenth century, when the Sunnī caliph in Baghdad came under the control of the Shī'ī Buyid dynasty, there were public commemorations of the martyrdom of Ḥusayn at Karbala on the tenth of Muḥarram ('Āshūrā'). These ceremonies caused riots in Baghdad and still do so in some countries such as Pakistan and India today. The commemoration is traditionally marked by public processions in which participants lamenting the death of the Prophet's grandson beat their breasts and backs with heavy iron chains. Scenes of Ḥusayn's death are re-created in passion plays known as *ta'ziyahs*, and he is eulogized in moving sermons and poetry recitals. Fed from childhood with such representational enactments of this event, a Shī'ī Muslim is likely to develop a deep sense of tragedy and injustice resulting in an ideal of martyrdom that is capable of being manipulated into outbursts of frenzied emotionalism, like the spectacular events of the Iranian Revolution.

Shī'ī sects. In the first and second centuries of the Islamic era, Shiism served as an umbrella for all kinds of ideologies, with a general social protest orientation, and the earliest heresiographers enumerate dozens of Shī'ī sects, several with extremely heretical and antinomian views. The main surviving body, the Ithnā 'Ashariyah, or Twelvers, number probably between fifty and sixty million people. All other

sects (except the Zaydīyah of Yemen) are regarded even by the Twelvers themselves as heretical extremists (*ghulāt*). The main one among these, the Ismā'īliyah, or Seveners, broke with the Twelvers in a dispute over which son of the sixth imam was to be recognized as the latter's successor: the Twelvers refused to recognize the elder son, Isma'il, because he drank wine, while the Seveners did recognize him (thus the name Ismā'īlī) and continue to await his return.

The Ismā'īliyah established a powerful and prosperous empire in North Africa and Egypt from the tenth to the twelfth centuries. Prior to this, the Ismā'īliyah had been an underground revolutionary movement, but once they attained political power, they settled down as part of the status quo. Since the late eleventh century, they have been divided into two branches: the Nizārīyah, commonly known by the name Assassins, who were active in Syria and Iran, and in recent years have been followers of a hereditary Aga Khan, and the Musta'liyah, who are mainly centered in Bombay. Ismā'īlī philosophy, which is reflected in the *Rasā'il Ikhwān al-Ṣafā'* (Epistles of the Brethren of Purity), produced by a secret society in the late ninth century, is essentially based on Neoplatonic thought with influences from Gnosticism and occult sects.

The Ismā'īlī sect, which was organized and propagated through a well-knit network of missionaries (*du'āh*), adheres to a belief in cyclic universes: each cycle comprises seven Speakers, or Messengers, with a revelation and a law; each Speaker is followed in turn by one of the seven Silent Ones, or Imams. The last imam, when he appears, will abrogate all organized religions and their laws and will institute a new era of a universal religion. During the leadership of the third Aga Khan (d. 1957), the Ismā'īlī community started drawing closer to the mainstream of Islam, a trend that seems to be gaining further strength at present under Karim Aga Khan's leadership: Ismā'īlī intellectuals now describe their faith as the "Ismā'īlī *ṭarīqah* [spiritual order] of Islam." There are other "extremist" subsects within the Shī'ah, including the Druze, Nusayriyah, and 'Alawīyūn. Of these, the Druze are the most prominent. This sect arose in the eleventh century as a cult of the eccentric Fatimid ruler al-Ḥakīm, who mysteriously disappeared in 1021.

Later sects. In more recent times, there have been two noteworthy sectarian developments, one within Shī'ī Islam in mid-nineteenth-century Iran and the other within Sunnī Islam in late nineteenth-century India. During an anticlerical movement in Iran, a certain Muḥammad 'Alī of Shiraz claimed to be the Bāb, or "Gate," to God. He was executed by the government under pressure from the 'ulamā' in 1850. After him, his two disciples, Subḥ-i Azal and Bahā' Allāh, went different ways, and the latter subsequently declared his faith to be an independent religion outside Islam. While the origin of the Bahā'ī religion was marked by strong eschatological overtones, it later developed an ideology of pacifism and internationalism and won a considerable number of converts in North America early in the twentieth century. In

Iran itself, Bābīs and Bahā'īs are frequent targets of clerical persecution, and many of them have been executed under the Khomeini regime.

The Sunnī sect called the Aḥmadīyah arose in the 1880s when Ghulām Aḥmad of Qadiyān (a village in East Punjab) laid claim to prophethood. He claimed to be at once a “manifestation” of the prophet Muḥammad, the Second Advent of Jesus, and an avatar of Kṛṣṇa for the Hindus. It is possible that he wanted to unite various religions under his leadership. After his death, his followers constituted themselves as an independent community with an elected *khalīfah* (successor; i.e., caliph). When the first caliph died in 1911, the Aḥmadīyah split in two: the main body carried on the founder's claim to prophethood under Aḥmad's son, Bashīr al-Dīn, while the other, the Lahore group, claimed that Ghulām Aḥmad was not a prophet, nor had he claimed to be one, but rather that he was a reformer or “renovator” (*mujaddid*) of Islam. Both groups have been active with missionary zeal, particularly in Europe and America. In 1974, the National Assembly of Pakistan, where the main body had established its headquarters after the creation of the state, declared both groups to be “non-Muslim minorities.”

Modernism. In the eighteenth century, against a background of general stagnation, a puritanical fundamentalist movement erupted in Arabia under Muḥammad ibn 'Abd al-Wahhāb (1703–1792). The movement called for a return to the purist Islam of the Qur'ān and the *sunnah* and its unadulterated monotheism, uncompromised by the popular cults of saints and their shrines. Ibn 'Abd al-Wahhāb married into the family of Sa'ūd, a chieftain of Najd, who accepted his teaching and brought all Arabia under his ruling ideology. At the same time, in the Indian subcontinent, Shāh Walī Allāh of Delhi, a highly sophisticated intellectual (said to have been a fellow student of Ibn 'Abd al-Wahhāb during his stay in Medina), also advocated a return to pristine Islam although, unlike his Arabian contemporary, he was a Šūfī at a high spiritual level.

In the nineteenth century a reformist militant group called the Jihād movement arose out of Walī Allāh's school, and three more movements followed in Africa—the Sanūsī in Libya, the Fulbe in West Africa, and the Mahdists in the Sudan. Although these three movements emerged from different environments, common to all of them was a reformist thrust in terms of the recovery of the “true pristine Islam” of the Qur'ān and the Prophet, particularly emphasizing monotheism; an insistence upon *ijtihād*, that is, rejection of the blind following tradition in both theology and law in favor of an attempt to discover and formulate new solutions to Islamic problems; and finally, resort to militant methods, including the imposition of their reformist ideologies by force. In addition, these movements generally brought to the center of consciousness the necessity of social and moral reforms as such, without recourse to the rewards and punishments of the hereafter. In other words, all three were characterized by a certain positivistic orientation.

While these premodernist reform movements laid great emphasis on *ijtihād*, in practice their *ijtihād* meant that Muslims should be enabled to disengage themselves from their present “degenerate” condition and to recover pristine Islam. Also, it is a general characteristic of all fundamentalist movements that in order to “simplify” religion and make it practical, they debunk the intellectualism of the past and discourage the growth of future intellectualism. In such cases education becomes so simplified that it is virtually sterile, thus leaving little possibility for *ijtihād*. Of the fundamentalist groups I have described above, the progenitors of the Indian and Libyan movements were sophisticated and accomplished scholars, but the leaders of the other three had only a modicum of learning and were primarily activists.

Nonetheless, these movements signaled real stirrings in the soul of Islam and paved the way for the intellectual activity of the Muslim modernists—Muslims who had been exposed to Western ideas and who, by integrating certain key ones among them with the teaching of the Qur'ān, produced brilliant solutions to the crucial problems then faced by Islamic society. The influence of premodernist reformism upon the modernists is apparent from the fact that they keep the Qur'ān and the tradition of the Prophet as ultimate referents for reform while criticizing or rejecting the medieval heritage. Thus, although their individual views regarding, for example, the relationship between faith and reason differ, all of them insist on the cultivation of positive sciences, appealing to numerous verses of the Qur'ān that state that the entire universe has been made subservient to good ends of humankind and that we must study and use it.

In the political sphere, citing Qur'ān 42:38, which says that Muslims should decide all their affairs through mutual consultation (*shūrā*, actually a pre-Islamic Arab institution confirmed by the Qur'ān), the modernists contended that whereas the Qur'ān teaches democracy, the Muslims had deviated from this norm and acquiesced to autocratic rule. Similarly, on the subject of women, the modernists argued that the Qur'ān had granted equal rights to men and women (except in certain areas of economic life where the burden of earning and supporting the family is squarely laid on men), but the medieval practice of the Muslims had clearly departed from the Qur'ān and ended by depriving women of their rights. Regarding polygamy, the modernists stated that permission for polygamy (up to four wives) had been given under special conditions, with the proviso that if the husband could not do justice among his co-wives then he must marry only one wife, and that finally the Qur'ān itself had declared such justice to be impossible to attain (4:129).

Of the half-dozen most prominent names in Islamic modernism, two were '*ulamā*'-trained along traditional lines: Jamāl al-Dīn al-Afghānī (1839–1897), a fiery activist with a magnetic personality, and his disciple, the Egyptian shaykh Muḥammad 'Abduh (1845–1905). Three were lay intellectuals with modern education: the Turk Namik Kemal (1840–1888) and the two Indians Ameer Ali (d. 1928) and

Muḥammad Iqbāl (1877–1938), while the Indian Sayyid Ahmad Khan (1817–1898), the most radical of them all in theological views, was a premodern lay-educated scholar. Yet, despite their differences and the fact that none of them, except for al-Afghānī and ‘Abduh, ever met any of the others, they shared the basic tenet—*à la* premodernist reform movements—that medieval Islam had deviated on certain crucial points from the normative Islam of the Qur’ān; this argument runs through all the issues that they discuss.

However, while these modernists sought reform within their own societies, they also waged controversies with the West on the latter’s understanding of Islam, and some of them, particularly Iqbāl, argued about the West’s own performance on the stage of history. Iqbāl bitterly and relentlessly accused the West of cheating humanity of its basic values with the glittering mirage of its technology, of exploiting the territories it colonized in the name of spreading humanitarian values, which it itself flouted by waging internecine wars born of sheer economic savagery, and of dewomanizing the women and dilapidating the family institution in the name of progress. Iqbāl was an equally strong critic of the world Muslim society, which for him represented nothing more than a vast graveyard of Islam. He called the whole world to the “true Islam” of the Qur’ān and the Prophet, a living, dynamic Islam that believed in the harnessing of the forces of history for the ethical development of mankind.

Iqbāl and others, such as the Egyptian Rashīd Riḍā (d. 1935), proved to belong to a transitional stage from modernism to a new attitude, perhaps best described as neofundamentalism, for unlike the fundamentalism of the premodernist reform movements, the current neofundamentalism is, in large measure, a reaction to modernism, but it has also been importantly influenced by modernism. This influence can best be seen on two major issues: first, the contention that Islam is a total way of life, including all fields of human private and public life, and is not restricted to certain religious rites such as the Five Pillars (to which the Islam of the traditionalist ‘*ulamā*’ had become practically confined); and, second, that cultivation of scientific knowledge and technology is desirable within Islam.

Besides emphasis on technology (although Iran appears to pay only lip service to science and technology), neofundamentalists have, on the one hand, oversimplified the traditionalist curriculum of Islamic studies, and, on the other, embarked upon a program of “islamization” of Western knowledge. Besides these points, the most basic factor common to the neofundamentalist phenomena is a strong assertion of Islamic identity over and against the West, an assertion that hits equally strongly at most modernist reforms, particularly on the issue of the status and role of women in society. This powerful desire to repudiate the West, therefore, leads the neofundamentalist to emphasize certain points (as a *riposte* to the modernist, who is often seen as a pure and simple westernizer) that would most distinguish Islam from the West. Besides the role of women, which is seen to lie at

home, the heaviest emphasis falls on the islamization of economy through the reinstatement of *zakāt* and the abolition of bank interest (which is identified with *ribā*, or usury, prohibited by the Qur’ān). No neofundamentalist government in the Muslim world—including Iran and Pakistan—however, has been successful in implementing either of the two policies, while the Libyan leader Mu‘ammar al-Qadhāfi has declared that the modern banking institution is not covered by the Qur’anic prohibition of *ribā*.

Neofundamentalism is by no means a uniform phenomenon. Apart from the fact that there exist, particularly in the Arab Middle East, extremist splinter groups of neofundamentalists that are strikingly reminiscent of the Khārijīs of early Islamic times, on most crucial issues, such as democracy or the nature of Islamic legislation, even the mainstream elements are sharply divided. While in Libya, for example, Mu‘ammar al-Qadhāfi has taken a most radical stand on legislation, repudiating the precepts of *ḥadīth* as its source and replacing them with the will of the people, the current rulers of Pakistan and Iran show little confidence in the will of the people. The most interesting attitude in this connection is that of the religious leaders of Iran: while almost all reformers since the mid-nineteenth century—including Shī‘ī thinkers such as Ameer Ali—have insisted that there can be no theocracy in Islam since Islam has no priesthood, the Iranian religious leaders are asserting precisely the opposite, namely, that Islam does have a priesthood and that this priestly class must rule, a position expounded even prior to the Islamic Revolution by Ayatollah Khomeini, the chief ruler of Iran, in his work *Vilāyat-i faqīh* (Rule of the jurist, 1971).

Finally, the phenomenon of international Islamic conferences in modern Islam is also to be noted since, in the absence of political unity in the Muslim world, these help the cause of unity of sentiment, if not uniformity of mind. The beginnings of this phenomenon go back to the 1920s, when conferences were held in Cairo and Mecca to deliberate on the possibility of reinstating the caliphate after Atatürk abolished it with the secularization of the Turkish state. But from the mid-1940s on, as Muslim countries gained independence from European colonial rule, the sentiment for international Muslim gatherings became progressively stronger. In the mid-1960s all the national and international private Islamic organizations became affiliated with the semi-official Saudi-sponsored Muslim World League (Rābiṭat al-‘Ālam al-Islāmī), headquartered in Mecca; the league finances Islamic causes both in the Muslim world and in Western countries, where large numbers of Muslim settlers are building mosques and Islamic centers and developing Islamic community life, including programs for education.

At the same time, since the 1969 Muslim Summit Conference held in Rabat, Morocco, an Islamic Secretariat has been set up in Jiddah, Saudi Arabia, as the administrative center for the Organization of Islamic Conferences (OIC) on the state level. Besides holding summit meetings, this organi-

zation maintains a developmental economic agenda through which interest-free development banks have been set up, financed principally by oil-rich Arab countries to help poorer Muslim countries (this is in addition to the aid given to non-Muslim countries). All these conferences, whether organized by the OIC or the World Muslim League, discuss political problems affecting the Muslim world and try to formulate a common response to them, through the United Nations and its agencies or through other channels.

Islam's attitude to other religions. According to Qur'anic teaching divine guidance is universal, and God regards all peoples as equal. Every prophet's message, although immediately addressed to a given people, is nevertheless of universal import and must be believed by all humanity. Muḥammad himself is made to declare, "I believe in any book God may have revealed" (Qur'ān 42:15), and all Muslims are required to do likewise. This is so because God is one; the source of revelation is one, and humankind is also one. The office of prophethood is, in fact, indivisible.

Muslims, however, have, from earliest times, considered Muḥammad to be the bearer of the last and consummate revelation. Nevertheless, there is a tension within the Qur'ān itself on this issue. In keeping with its fundamental teaching that prophethood is indivisible, the Qur'ān, of course, invites Jews and Christians to Islam; it insists on the unity of religion, deplores the diversity of religions and religious communities, which it insists is based on willful neglect of truth, and denounces both Jews and Christians as "partisans, sectarians," with "each sect rejoicing in what itself has" (30:32).

On the other hand, it states that although religion is essentially one, God himself has given different "institutions and approaches" to different communities so that he might "test them in what he has given them," and that they might compete with each other in goodness (5:48), which implies that these different institutional arrangements have positive value and are somehow meant to be permanent. In fact, the Qur'ān categorically states that whether a person is a Muslim or a Jew or a Christian or a Sabian, "whosoever believes in God and the Last Day and does good deeds, they shall have their reward with their Lord, shall have nothing to fear, nor shall they come to grief" (2:62; see also 5:69). This tension is probably to be resolved by saying that it is better, indeed incumbent upon humankind to accept Muḥammad's message, but that if they do not, then living up to their own prophetic messages will be regarded as adequate even if it does not fulfill the entire divine command.

The organization of Muslims as a community—which was inherent in the message of the Prophet—set in motion its own political and religious dynamics. The Qur'ān itself, while strongly repudiating the claims of Jewish and Christian communities to be proprietors of divine truth and guidance, frankly tells Muslims also (for example, in 47:38) that unless they fulfill the message they cannot take God for granted. Soon after the time of the Prophet, however, the community came to be regarded as infallible, and a *ḥadīth* was put into

currency that the Prophet had said "My community shall never agree on an error." This development was necessitated partly by intercommunal rivalry, but largely by the internal development of law, since the doctrine of legal consensus had to be made infallible.

In his last years, the Prophet decided on the policy of forcible conversion of Arab pagans to Islam and gave religious and cultural autonomy to Jews and Christians as "people of the Book" (although Jews were driven out of Medina by Muḥammad and later from the rest of the Arabian Peninsula by 'Umar I). Muslims had to determine for themselves the status of Zoroastrians, Hindus, and Buddhists when they conquered Iran and parts of Northwest India. It was decided that these populations were also "people of the Book" since they believed in certain scriptures, and consequently they were allowed to keep their religion and culture, like the Jews and Christians, on payment of the poll tax (*jizyah*). In contrast with their stance toward Jews and Christians however, Muslims were prohibited from having social intercourse or intermarrying with these other groups.

Indeed, when the community became an imperium, further developments took place that had little to do with the Qur'ān or the *sunnah* of the Prophet but rather were dictated by the logic of the empire itself. The law of apostasy, for example, which states that a Muslim apostate should be given three chances to repent and in the case of nonrepentance must be executed, has nothing to do with the Qur'ān, which speaks of "those who believed and then disbelieved, then once again believed and disbelieved—and then became entrenched in disbelief" (4:137; see also 3:90), thus clearly envisaging repeated conversions and apostasies without invoking any penalty in this world. It is, therefore, important to make these distinctions and to treat historic Islam not as one seamless garment but rather as a mosaic made up of different pieces.

There are numerous other laws that are the product neither of the Qur'ān nor of the Prophet's *sunnah*, but of the Islamic imperium, such as the inadmissibility of evidence of a non-Muslim against a Muslim in a criminal case. In this legal genre also falls the juristic doctrine that the world consists of three zones: the Abode of Islam (*dār al-Islām*), where Muslims rule; the Abode of Peace (*dār al-ṣullḥ*), those countries or powers with whom Muslims have peace pacts; and the Abode of War (*dār al-ḥarb*), the rest of the world. This doctrine was definitely the result of the early Islamic conquests and the initial Islamic law of war and peace resulting from them. But during the later Abbasid period, the concept of *jihād* was formulated in defensive terms, because the task then was the consolidation of the empire rather than the gaining of further territory through conquest. To this general problem also belongs the consideration advanced by several Western scholars that Islam cannot authentically be a minority religion because the presumption of political power is built into its very texture as a religion. What is true is that Islam requires a state to work out its sociopolitical ideals and

programs, but this does not mean that Muslims cannot live as a minority; indeed they have done so throughout history. The Qurʾān, in fact, envisages some sort of close cooperation between Judaism, Christianity, and Islam, and it invites Jews and Christians to join Muslims in such a goal: “O People of the Book! Let us come together on a platform that is common between us, that we shall serve naught save God” (3:64).

BIBLIOGRAPHY

General Works

For a general survey of Islam, see *The Cambridge History of Islam*, vol. 2, *The Further Islamic Lands, Islamic Society and Civilization*, edited by P. M. Holt, Ann K. S. Lambton, and Bernard Lewis (Cambridge, 1970), and my own book entitled *Islam*, 2d ed. (Chicago, 1979). Richard C. Martin's *Islam: A Cultural Perspective* (Englewood Cliffs, N.J., 1982) gives a good description of Islamic religious practice. For a developmental view of Islam in a global setting, see Marshall G. S. Hodgson's *The Venture of Islam*, 3 vols. (Chicago, 1974). A collection of essays rarely matched for perspective interpretation of Islamic civilization is H. A. R. Gibb's *Studies on the Civilization of Islam* (Boston, 1962). Two other works of general interest are *The Legacy of Islam*, edited by Thomas W. Arnold and Alfred Guillaume (London, 1931), and *The Legacy of Islam*, 2d ed., rev., edited by C. E. Bosworth and Joseph Schacht (Oxford, 1974).

Topical Studies

For the general reader and the scholar alike, an excellent guide to the Qurʾān is *Bell's Introduction to the Qurʾān* (Edinburgh, 1970), W. Montgomery Watt's revised and enlarged edition of a work published in 1953 by Richard Bell. My own study, *Major Themes of the Qurʾān* (Chicago, 1980), is a systematic presentation of the views of the Qurʾān on God, man, society, revelation, and so on. Among translations of the Qurʾān,

three can be recommended: *The Meaning of the Glorious Koran*, translated and edited by M. M. Pickthall (New York, 1930); *The Koran Interpreted*, translated by A. J. Arberry (New York, 1955); and *The Message of the Qurʾān*, translated by Muḥammad Asad (Gibraltar, 1980). Both Pickthall's and Arberry's translations have been frequently reprinted and are readily available, but Asad's painstaking and thoughtful translation is well worth seeking out.

Two works on *ḥadīth* that may profitably be consulted are Ignác Goldziher's *Muslim Studies*, 2 vols., edited by S. M. Stern and C. R. Barber (Chicago, 1966–1973), and Alfred Guillaume's *The Traditions of Islam* (1924; reprint, Beirut, 1966).

Among the many works devoted to the Prophet's biography, none is entirely satisfactory. Alfred Guillaume's *The Life of Muḥammad: A Translation of [Ibn] Ishāq's "Sīrat Rasūl Allāh"* (1955; reprint, Lahore, 1967), an English translation of the first extant Arabic biography (second century AH), is the best guide one has at the present. W. Montgomery Watt's *Muhammad at Mecca* (London, 1953) and *Muhammad at Medina* (London, 1956) may be usefully read as secondary sources.

On Islamic theology the following works are recommended: *A Shi'ite Creed: A Translation of "Risālatu'l-I'ṭiqādāt" of Muḥammad b. ʿAlī Ibn Bābawayhi al-Qummī*, edited and translated by A. A. Fyzee (London, 1942); D. B. Macdonald's *Development of Muslim Theology, Jurisprudence and Constitutional Theory* (1903; reprint, New York, 1965); W. Montgomery Watt's *The Formative Period of Islamic Thought* (Edinburgh, 1973); and A. J. Wensinck's *The Muslim Creed: Its Genesis and Historical Development* (1932; reprint, New York, 1965).

For information on Islamic law the following works are useful: *Law in the Middle East*, edited by Majid Khadduri and Herbert J. Liebesny (Washington, D. C., 1955); J. N. D. Anderson's *Islamic Law in the Modern World* (New York, 1959); Noel J. Coulson's *A History of Islamic Law* (Edinburgh, 1971); and Joseph Schacht's *An Introduction to Islamic Law* (Oxford, 1974).

Numerous works on Sufism are readily available. Among them are Reynold A. Nicholson's *The Mystics of Islam* (1914; reprint, Beirut, 1966) and *Studies in Islamic Mysticism* (1921; reprint, Cambridge, 1977); A. J. Arberry's *Sufism: An Account of the Mystics of Islam* (London, 1950); J. Spencer Trimingham's *The Sufi Orders in Islam* (New York, 1971); and Anne-marie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N. C., 1975).

For Islamic political thought and education, the following works are useful: A. S. Tritton's *Materials on Muslim Education in the Middle Ages* (London, 1957); E. I. J. Rosenthal's *Political Thought in Medieval Islam* (Cambridge, 1958); Bayard Dodge's *Muslim Education in Medieval Times* (Washington, D. C., 1962); Ann K. S. Lambton's *State and Government in Medieval Islam*, vol. 1, *The Jurists* (London, 1981); Hamid Enayat's *Modern Islamic Political Thought* (Austin, 1982); and my own *Islam and Modernity: Transformation of an Intellectual Tradition* (Chicago, 1982).

The most important statements on Islamic modernism by Muslim modernists themselves are Syed Ameer Ali's *The Spirit of Islam: A History of the Evolution and Ideals of Islam*, rev. ed.

(London, 1974), and Muḥammad Iqbal's *Reconstruction of Religious Thought in Islam* (1934; reprint, Lahore, 1960). General writings on and critiques of Islamic modernism by modern Western scholars include H. A. R. Gibb's *Modern Trends in Islam* (Chicago, 1947); G. E. von Grunebaum's *Modern Islam: The Search for Cultural Identity* (Los Angeles, 1962); and Wilfred Cantwell Smith's *Islam in Modern History* (Princeton, 1957).

The following are important regional treatments: Charles C. Adams's *Islam and Modernism in Egypt* (1933; reprint, New York, 1968); Wilfred Cantwell Smith's *Modern Islam in India* (London, 1946); Albert Hourani's *Arabic Thought in the Liberal Age, 1798–1939*, 2d ed. (Cambridge, 1983); Bernard Lewis's *The Emergence of Modern Turkey* (London, 1963); Niyazi Berkes's *The Development of Secularism in Turkey* (Montreal, 1964), a mine of information despite its secularist bias; and J. Boland's *The Struggle of Islam in Modern Indonesia* (The Hague, 1971).

FAZLUR RAHMAN (1987)
Revised Bibliography

ISLAM: AN OVERVIEW [FURTHER CONSIDERATIONS]

The "Preface" to the first edition of *The Encyclopedia of Religion* (1987), edited by Mircea Eliade, highlighted the "radical change of perspective" and the "impressive advances in information and understanding" that had affected religious studies and that underlined the impetus behind a new *Encyclopedia*. In his entry, "Islam: An Overview," Fazlur Rahman sought to capture and synthesize some of these changes and advances in rewriting an understanding of the Muslim strand in the religious history of humankind. His continuing influence on scholarship in the field is a testimony to his contribution to *The Encyclopedia of Religion* and to wider scholarship on Islam.

Fazlur Rahman belonged to a small group of Muslim academics who received training in two different contexts: a traditional Muslim one (primarily from his parents and also from private tutors) and a modern, Western academic experience. He became over time one of the most prominent representatives of bringing to the study of Islam a scholarly approach and to an interested world a reflection of an "enlightened" Islam. In the course of his academic life he faced open hostility from those who rejected and undermined his approach and a level of indifference or even suspicion from modern Muslim intellectuals, who having adopted a more secularized view, regarded his emphasis on the relevance of faith as misplaced.

These footnotes to the article, as it were, engage some of the issues he raised in the light of further advances, changes, and challenges in current scholarship, and also suggest additional perspectives that take into account developments in the ongoing history of Muslims and scholarly discourse in the wider academic world.

The first set of questions arises with regard to the uses and meanings of the term *Islam*. This remains a major concern of contemporary scholars and a significant topic of debate. This has highlighted the need for a clearer distinction between *Islam* understood as a defined faith tradition, that is to say as a theologically organized system of beliefs and rituals, on one hand, and the historical contexts and developments that have engaged Muslims in articulating their faith on the other. The historian Marshall G. S. Hodgson proposed a set of concepts such as *Islamdom*, *Islamicate*, and the like to differentiate various historical representations of Islam. Although Fazlur Rahman was aware of the necessity of such distinctions (he mentions the need to "treat historic Islam not as one seamless garment but rather as a mosaic made up of different pieces") the logic of his stance awaits a fuller development, precisely to avoid the kind of reductionist stance that the editors of the first edition clearly wished to avoid.

In the same article, Fazlur Rahman stated that, "Islam is . . . the name of a total way of life and does not merely regulate the individual's private relationship with God." Such a view builds on the concept of the precedent set by the Prophet to create institutions and manage the community's growth and development as a Prophet, not merely as a ruler, a lawgiver, a judge, or a military head. This interpretation, which has been supported by many modern Muslim interpreters, had been challenged by several of his contemporaries including, Ali Abderraziq, Ma'ru'f Rusafi, and more recently Mohamed Arkoun, among others. According to their perspectives, the kind of leadership exercised by the Prophet in his life was to be understood as an "exceptional" and historically contingent moment in history. It was much later, and very gradually, that the fusion of religion and temporal matters (including politics) was constructed, first by the invention of the title "caliph" ("successor" of the Prophet), and during the Abbasid dynasty later, with the definition

of a caliphate modeled in theory, if not always in practice, as a theocracy.

The historical reality of the lived experience of Muslims was that they drew the conceptual framework of their collective life, in ethics and politics, from diverse sources, including Persian and Indian traditions, Greek philosophy, and local customs. In reality, as Fazlur Rahman shows, political power had become de facto separate from religio-legal power. From that perspective one can only study Islam as it has been appropriated, interpreted, and invoked in human contexts, by Muslims and non-Muslims, in contrast to Islam as an essentialist notion or as a purely metaphysical idea “out there.” The focus on the histories, cultures, and material contexts of people for whom Islam has been and continues to be a powerful force can thus benefit from all of the critical scholarly apparatus and questions that arise across the full spectrum of the study of religion. Given such an approach, it might be inappropriate to speak of a mainstream construction of “orthodoxy” because all Muslim traditions did not invoke or appropriate the sources in the same way. This would suggest a more comparative approach in the study of Muslim societies, when, like other religions, developments within were affected by interactions— theological, cultural, legal, and political—that had profound effects on how certain patterns came to monopolize Muslim discourse. This is not to suggest that religious traditions themselves do not invoke normativeness; rather that the goal of religious studies is to show how such notions are developed, constructed, and institutionalized, and that Islam like other religions is plural and pluralistic.

This has interesting implications for understanding historical appropriation in contemporary Muslim history and societies where Muslims, like others, are increasingly seeking inspiration and markers of identity from the past. This constituted an important part of Fazlur Rahman’s scholarly work. Mohamed Arkoun, Abuzayd and Abdul Karim Soroush have more recently addressed the relationship of new methodologies and approaches to the study of Islam and of the Qur’an and identified the limitations of both traditional scholarship and modern Muslim apologetics. The idea of religious reform that Fazlur Rahman sought to analyze as it emerged from the nineteenth century onwards has in contemporary contexts taken on an urgent relevance in global affairs and scholarly and public debates, within and outside Muslim societies.

The first “reformists” of the nineteenth century were Muslim intellectuals, including religious scholars, officials, and senior functionaries in administration, originating from similar social strata and having received more or less identical training in legal and religious matters. They were individuals who belonged to the tiny minority who had access to the written heritage of Muslims, and who could compare the current status of affairs with norms, models, and rules set by earlier generations. Their judgment was that Muslims had fallen short of the real expectations of their faith and the

achievements of their predecessors. Such a view, however, took no account of the variety of formations within the larger Muslim *ummah*. The focus on the views of certain reformers distorted both how Muslims had experienced their respective histories but also the different way in which they memorialized their past. The need for redress or rectification (this is the original meaning of their main slogan, *iṣlāḥ*) was therefore identified with a kind of return to normality, that is, a movement back to fundamentals as they were enacted by earlier generations. The early Muslim community was considered de facto as more pious (thus the expression *salaf salih*). This “normativeness” was retrospectively imagined to mirror values similar to those exemplified in European contexts of the time, including rationality, toleration, and ethically determined behavior.

The increasing availability of primary sources for groups such as the Shi‘ah, Khwarij, Mu‘tazilah, and others suggests that we can no longer accept a monolithic view of how Muslims enacted responses to change. The pluralization of discourses within the early community, as indeed within different communities of interpretation, needs now to become an integral part of the study of Islam. This becomes particularly relevant in addressing significant shifts or “turns” in the history of Muslim thought. Contemporary scholarship highlights, for instance, the mode and process by which al-Shāfi‘ī’s synthesis of jurisprudence assumed a normative dimension. A similar pattern would occur later in the dynamics of legal formulation in Twelver Shiism. However these “turns” occurred after long periods of debate, challenge, and even competition, which, when allied to particular political contexts, created conditions for the empowerment of certain traditions over others. This offers a more nuanced view of the flow of Muslim intellectual history and its consequences for representing the primacy of law over philosophical thought and for the widespread influence of Sufism to offer alternative patterns for expressions of piety and personal direction.

Early reformers did not ignite the mass mobilization they had hoped for, and were therefore not able to give impetus to a sustainable process for redressing the conditions through a reform of ideas and practices grounded in Islam. However, their thought contributed, on the one hand, to creating support for nationalist movements and, on the other hand, to reviving conservative trends that considered the return to the purity of the norms and the pristine models of the past as the panacea. A few Muslim thinkers did recognize major shifts in history with the advent of the industrial revolution in Europe and its links to dramatic social change as well as unprecedented developments in science, technology, and the arts. Those among them who called for a reexamination of the self based on proper acknowledgement of this turn were rejected as unfaithful to the sacred heritage and to the cause of Muslim self identification and emancipation. The most lasting effect of the first reformist wave was therefore the establishment of a *salafī* (traditionalist) trend and

the laying of seeds for more radical perspectives to emerge in time. There was however a shared belief that the modern state was a key mode through which to liberate Muslims from foreign domination and to re-Islamize society through reenactment of the original norms. The older dynamic between faith, power, and governance thus found new spaces in which to be played out.

The more globalized environment of the last few decades has, in spite of dramatic failures to create stable civil societies in many parts of the Muslim world, opened worlds of meanings, concepts, and methods that have prompted alternative views and attitudes for a new generation of Muslims. In the last two decades, the cumulative efforts of scholars across the globe have resulted in the accumulation of new data and categories of interpretations. The interplay of the two has shed new light and raised more questions for an emerging generation of scholars, who, while investigating the historicity of forms and expressions of Islam, are also questioning the stability of assumptions about what were regarded as core religious beliefs, institutions, and ethical principles. The analysis and intelligent adaptation of values inherited by Muslims to modern conditions was an important goal for the generation led by Fazlur Rahman. It seems appropriate that the next phases will build on that legacy to develop a space for discussion of Islam within a more universal framework within the history of religions.

BIBLIOGRAPHY

The various entries on Islam in the encyclopedia indicate the significant growth in scholarship on Islam that has taken place in the last two decades. Ebrahim Moosa has edited Fazlur Rahman's selected articles in a volume entitled *Revival and Reform in Islam* (Oxford, 1999). See Abdullah Saeed's article in Taji-Farouki text cited below.

An example of recent works that illustrate the increasing complexity of developments in early Islamic thought based on a vast array of primary sources are:

ABDOU FILALI-ANSARY (2005)

ISLAM: ISLAM IN NORTH AFRICA

The term *North Africa* usually denotes the region that includes the countries of Libya, Tunisia, Algeria, Morocco, and Mauritania. Because this region corresponds to what Arab writers call the Maghreb (the "west"), this article shall use both terms here with no distinction of meaning. The unity of this region originates in its continuous settlement: From the dawn of history it has been inhabited by Berbers who came mostly from the banks of the Red Sea and who were later joined by Europeans, Semites, and blacks. North Africa was in contact with all the great civilizations of antiquity and became an integral part of the Islamic world at the end of the seventh century CE. Although it has never become wholly Arabized like Greater Syria and Egypt, it was totally Islamized, with the exception of a Jewish minority that has always been in existence there. Moreover, from the twelfth century CE, the vast majority of the population has followed the Mālikī legal tradition (*madhhab*).

In North Africa as elsewhere, Islam may be considered either as a religion or as a form of culture, and according to the point of view adopted, the same facts may be interpreted in quite different ways. In the following pages Islam is referred to not as a culture that has been more or less influenced by the Qur'anic message but as a religion. Discussion will center on the movements, the works, and the people who have formed the feelings and the religious behavior of the inhabitants of the Maghreb.

PRE-ISLAMIC RELIGION. The message of the prophet Muḥammad itself bore the marks of Arab polytheisms, and the Islamization of North Africa was likewise influenced by the religious situation already present there.

The prehistoric substrate. The prehistory of the Berbers remains obscure. The Libyan inscriptions guard their secrets, and funerary monuments and rock drawings can be interpreted in diverse ways according to whether Egyptian, Mediterranean, or Saharan influences are discerned in them. Scholars do agree, however, on two points: The ancient Berbers did not differentiate between magic—a technique used to harness the powers of nature—and religion—the worship of a divinity with a more or less distinct identity. Later their divinities were exclusively local ones.

Thus, say the specialists, it is better to refer not to a Berber religion as such, but to a specific attitude toward the sacred, which the inhabitants of North Africa associate even today with caves, springs, certain trees, certain stones, and so on. This strategy of the sacred was aimed at satisfying basic needs, such as causing rain, curing an infertile woman, or guaranteeing victory. Its presence has been noted by writers as far apart in time and space as the Greek historian Herodotus (sixth century BCE), the Moroccan traveler Ibn Battutah (fourteenth century CE), and the Finnish anthropologist Edward Westermarck (twentieth century). The notion of *barakah* (a polymorphous power linked to holiness), the institution of the *zāwīyah* (a brotherhood centered on a sanctuary), the *ziyārah* (cult of saints), the *shabāh* (a ritual dance), and the *samaʿ* (ritual music) have all played an important role in the religious feeling of the Maghreb people until quite recently, despite the fact that official Islam has opposed them for centuries; many anthropologists maintain that such features can only be explained in terms of this fundamental attitude toward the sacred that had already colored the Phoenician religion, Roman polytheism, and Christianity well before the arrival of Islam.

The Phoenico-Punic influence. The Phoenicians reached the shores of North Africa at the beginning of the first millennium BCE, founded Carthage, and set up a large number of trading posts along the coast. A seafaring nation of traders, they did not venture far into the interior until well into the fifth century BCE. What was their influence on local culture? Historians differ in their assessments, but they all maintain that it was crucial, for the Berbers were also from the East. The punification of Maghrebi culture did not coincide, however, with the period when Carthage was at the height of its power: It was only after the city was overcome and destroyed (146 BCE) that the *aquellids* (“kings”) of Numidia and Mauritania adopted the most characteristic features of Carthaginian civilization. Both epigraphic and archaeological discoveries have shown that the cult was colored by the Phoenico-Punic religion, that the goddess Tanit was accorded an important position, and that child sacrifice, so loathsome to the Romans, was commonplace. This speeding up of the process of punification seems to have been a deliberate challenge to imperial Rome. According to Stéphane Gsell, the French specialist on ancient African history, it also prepared the population for Islamization later on.

Romanization and christianization. Roman polytheism as it spread to the peoples of North Africa was insepara-

ble from Romanization, which had been, in many respects, quite remarkable. But, challenged by the Carthaginian divinities and soon undermined by Christian propaganda, the Roman religion never had time to gain a permanent foothold. Many studies have shown that it was profoundly africanized. Latin names only superficially mask pre-Roman divinities: Jupiter has been identified with Amun, Saturn—that most African of gods—with Baal-Hammon, Juno-Caelestia with Tanit, Asklepios with Eshmun, and so forth.

The problem of specific local characteristics also arises with reference to African Christianity. The new religion rapidly made converts, especially in the towns, as can be seen from the number of followers affected by the persecutions of the third century CE. Nor can one forget the appearance of such great thinkers as the apologist Tertullian (d. after 220 CE), Cyprian, bishop of Carthage (d. 258), and Augustine the church father (d. 430). However, the most significant phenomenon during this period was undoubtedly the Donatist schism, which deeply divided Roman Africa throughout the fourth century. Whether this was an attempt to found a national church or a movement of social protest, the basic point is that it reveals a permanent aspect of the psychology of the Maghrebians. They seem to accept foreign cultures easily enough but select from them one element that they then transform into a symbol of their own identity. In this sense it may be said that the Donatists foreshadowed the Muslim Khārijis of three centuries later.

Berber religiosity. North Africa was thus subjected in turn to Egyptian, Phoenician, Greco-Roman, and Christian influences, without any real alteration of its fundamental religious attitude. Foreign religions, which gave the appearance of being accepted without any difficulties, were in fact profoundly transformed on the day-to-day level. Professions of faith, institutions, and cults changed, but what remained intact was a type of religiosity: Characterized by its vehemence, its extremism, and its tendency to intellectual simplification, it is to be found at each stage of the development of Maghrebi Islam.

Excessive intellectualism was linked with a strong attachment to the humblest of popular cults, as though the North Africans refused to see religion as a means of individual salvation: The social always took precedence over the individual, the concrete and useful over the purely spiritual. For them, religion was above all a communal ethic. The simpler and clearer the creed, the better it fulfilled its role. Both local cults and elaborate dogma, however far apart they might seem to be from a purely formal point of view, nevertheless tended toward the same end: holding the social body together.

A single religious consciousness expressed in diverse religious forms—this is a hypothesis of continuity that many specialists would be reluctant to accept. However, a number of historians have adopted it, at least as a starting point for their work, even if it has proved necessary to alter it later for a clearer explanation of how the Maghreb became Muslim.

Islamization, in North Africa as elsewhere, was a dual process. Islam originated as a set of beliefs and behaviors indigenous to the Arabs of the Middle East, but the long and rich experience of the Maghrebi population that received it was also to determine its final form. Three centuries before the appearance of the first Muslim missionaries, the region, with the exception of Carthage, was totally free from foreign influence. Independent principalities, whose internal histories are relatively obscure, had come into being. Epigraphic evidence proves that the Punic religion and Christianity persisted, that Judaism was spreading, and that Donatism and Manichaeism were flourishing again. It was within this extremely complex situation, with its strange syncretisms, that Islam was to develop. The belief that North Africa went directly from Christian orthodoxy to Sunnī Islam is nothing but an illusion.

THE ARAB PERIOD. This term, inadequate as it might seem, refers to the period from the second to the fifth Muslim centuries (seventh to eleventh centuries CE). With its own distinctive features, the period was Arab only in a very restricted sense. But under this rubric shall be considered first of all the conquest, or the taking of political power by the warriors from the Middle East; second, Islamization, or the adoption of rites and beliefs defined by the Qurʾān; and finally, Arabization, in its dual ethnic and cultural senses as a change in the actual makeup of the population and as the adoption of Arab language and customs. These three developments were far from identical.

The conquest. The first Arab armies arrived in Ifrīqiya (formerly known as Byzacene) in AH 26/647, but the conquest began only nine years later, when ʿUqbah ibn Nāfiʿ founded the city of Kairouan as a permanent base for his soldiers. ʿUqbah decided to skirt the northern towns that had been fortified by the Byzantines and to follow the inland route of the high plateaus, where the independent principalities had been set up. At first these tactics paid off, for the Arab general, after defeating the Berber chief Kusaylah, was able to cross the whole country as far as the Atlantic Ocean without meeting any further resistance. However, on his way back he found that the Berbers and the Byzantines had united to cut off his lines of communication, and his army, which he had misguidedly divided into small groups, was wiped out. Another leader of the conquest, Ḥassān ibn al-Nuʿmān, drew the logical conclusions from this defeat and decided to attack Carthage, which was the center of Byzantine power. He took it by storm in 691, lost it, then recaptured it definitively in 695. It was at that moment that the mountain people of the Aures, who had fought fiercely for their independence against the Vandals and the Byzantines during the past two centuries, rose up in revolt under the leadership of a woman the Arabs called al-Kāhinah (“the sorceress”). Because the conquerors are interested only in our wealth, al-Kāhinah reasoned, let us turn our land into a desert and they will leave. She then gave the order to cut down all the trees, thus causing a terrible deforestation with consequences that are still felt today. Is this truth or legend? In either case,

this last-ditch effort did not have the anticipated results. The Arabs did not leave the devastated land, and al-Kāhinah, seeing how things were turning out and herself unable to surrender, advised her sons to go over to the enemy. Military operations continued for another ten years or so in the west of the country. The new general, Mūsā ibn Nuṣayr, returning to the policy of one of his predecessors, Abū al-Muḥājir, widely applied the system of *walāʾ* (“adoption”) and took into the Arab aristocracy the sons of the vanquished leaders. This ethnic interpenetration was so rapid that the conquest of Spain, which began in 711, was led by a *mawlā* (“client”) of Mūsā, the Berber Ṭāriq ibn Ziyād.

Unlike the centralized monarchies of Egypt, Persia, and Spain, whose destinies were sealed by the outcome of a single battle with the Muslims, the Maghreb was conquered definitively only after a half-century of fighting. There were several reasons for this. Mountainous, compartmentalized, and politically fragmented, the country was always difficult to conquer. The Arabs were faced with several different groups: Rūm (Byzantines), Afranj (Romans), Afāriq (punicized Berbers), nomad and sedentary peoples. Each of these groups had its own defense tactics and had to be countered by an appropriate attack. Berber resistance varied between the policy of Kusaylah and that of al-Kāhinah, and the Arab strategy also wavered between the rigor of ʿUqbah and the liberalism of Abū al-Muḥājir. Moreover, the conquering armies felt the repercussions of the crises that shook the Muslim caliphate from 660 to 694.

Some historians who are not specialists on Islam believe that the first Arab conquerors were nomads such as the Banū Hilāl, who invaded the country more than three centuries later. This belief is wholly erroneous; they were in fact highly skilled horsemen, trained in the latest cavalry tactics. Most of them came from Syria and were the descendants of people who had been in contact with the Romans and the Byzantines for generations. Thus they came to the Maghreb as heirs of ancient civilizations. As time went on, the neo-Byzantine character of the Arab administration became more and more obvious.

Arabization. From an ethnic point of view, the process of Arabization seems to have been very limited in scope. According to the most reliable historians, the number of Arabs settled in the country during the first Muslim century did not exceed fifty thousand. The local population, especially in Ifrīqiya, was already fairly mixed; this characteristic was accentuated by the conquest, for the “Arab” armies in fact included Byzantines, Persians, and, very early on, Berbers, probably nomads, who were later known as Zanātah.

The adoption of Arab customs, habits, costume, and language was doubtless very rapid; the early Arab chroniclers all emphasize the Himyarite (Yemenite) origin of the Berbers, which suggests that a feeling of distant ethnic solidarity existed. The system of *walāʾ* meant that many Berber clans were linked with the Qahtanites (southern Arabs). The word *berber* rapidly lost its original etymological meaning and

came to designate the inhabitants of isolated mountain regions. Since Islamization, the fundamental distinction in North Africa has been sociocultural rather than ethnolinguistic.

Cultural arabization was naturally enhanced when political authority was in Arab hands. During the period under consideration the power of the Arabs was solidly established in what is now Tunisia and in that part of Spain bordering on the Mediterranean. These were populated, prosperous regions, easy to defend, where the Punic influence had been deep and lasting. Kairouan and Cordova, the capitals of the two provinces, maintained uninterrupted relations with the other Muslim metropolises and were the starting points for the spread of Arab culture and orthodox Islam.

After the conquest the Maghreb was governed by emirs appointed by the Umayyad caliphs in Damascus. With the Abbasid Revolution of 750, which saw the capital transferred to Baghdad, the empire became more Persian than Arab, more Asian than Mediterranean. The western provinces, which from then on would be more difficult to watch over, began to break away one after the other. In 755 an Umayyad prince who had fled to Spain founded an independent emirate there. In 787 Idrīs I, a descendant of ‘Alī ibn Abī Ṭālib, did the same in Morocco. Finally, in 800, Ifrīqiyā achieved autonomy under the Aghlabid dynasty, with the consent of the caliph.

In the ninth century, the Umayyad and Aghlabid emirates exercised military and commercial control over the whole of the western Mediterranean. Muslim Spain, which became a caliphate in 929, retained its preeminence right up to the great crisis of 1009; its capital, Cordova, was the equivalent of Baghdad or Cairo. The western half of the Maghreb lived in the sphere of Spain’s cultural and political influence; the princes of Ceuta, Fez, Tlemcen, and elsewhere, whether Arabs or Berbers, were clients of the caliph of Cordova, and as such they spread Andalusian culture and Umayyad orthodoxy.

As for the Aghlabid emirate, it fell victim to the propaganda of the Shī‘ī Fatimids, who maintained that only the descendants of ‘Alī and Fāṭimah, the cousin and daughter respectively of the prophet Muḥammad, could legitimately lay claim to the caliphate. One of their *dā‘īs* (“missionaries”) who had come from the Yemen settled among the Kutāmāh Berbers in the mountainous region of Little Kabylia. There, surrounded by a population favorable to the ‘Alids and out of the reach of Aghlabid power, he patiently bided his time. The Aghlabid army, weakened by the quarrels that split the reigning family, was crushed at al-Urbus (ancient Laribus) in 909, and the residence of the emirs, Raqqādah, was taken by storm. A year later the real pretender arrived and officially adopted the title of ‘Ubayd Allāh al-Mahdi. But for the victorious Fatimids Ifrīqiyā was no more than a base for the conquest of the Abbasid empire. Once they had taken command of Egypt in 969, they abandoned Ifrīqiyā to their Kutāmāh allies. Thus two dynasties were born: the Zirids in

what is now Tunisia, and the Hammadids in the east of present-day Algeria; both were descendants of Zīrī ibn Manād, the army general who became regent after the departure of the Fatimid caliph, and both were to prosper until the mid-eleventh century.

Applied to this period, then, the term *Arab* is clearly inadequate. It was indeed princes from the East who founded states and created cities where the army, the administration, and the religious institutions spread Arab culture, but very early on political power was shared; without the Awribah, Idrīs I would never have reigned, and without the Kutāmāh, ‘Ubayd Allāh could never have laid claim to the caliphate.

There is no doubt that the process of Arabization was very slow. Epigraphic finds have shown that Punic and Roman-Christian influences subsisted for a long time after the conquest, but the importance of such relics must not be exaggerated. The narratives that tell the story of the beginning of the Fatimid dynasty show clearly that the Kutāmāh homeland, although it was far from the capital and isolated by its mountainous surroundings, was nevertheless open to the influence of the cities, which were themselves wholly given over to the distinctive values of Arab culture. Arabization was set in motion by Arab governors, but it did not cease when the power passed into Berber hands, as can be seen from the behavior of the Zirid and Hammadid princes, who were direct descendants of the Ṣanḥājāh Berbers.

Islamization. In 660 a serious crisis split the eastern Muslim community. Two opposing clans were struggling for the caliphate: the supporters of Mu‘āwiyah and the Umayyad family in general, and the followers of ‘Alī ibn Abī Ṭālib and, by extension, the Hashimites, the Prophet’s clan. Later there appeared a more neutral faction who maintained that authority should be conferred by election and that the caliph could be non-Qurayshī and even non-Arab. The last mentioned were known as Khārijīs; the second were called Shī‘ah; and the first, *ahl al-jamā‘ah*, that is to say, the supporters of the majority, who were later to become the Sunnīs (orthodox ones). At first all three factions were similarly Arab; but when the conquering Umayyads set up a predominantly Qurayshī administration in Damascus, the Shī‘ah and the Khārijīs turned toward the newly converted, and, confronted by Sunnism—an official, conservative, moderate Islam that was also an Arab Islam—they took up a non-Arab and sometimes even a frankly anti-Arab stance.

Islam spread more rapidly in North Africa than did the Arab language. This was a paradoxical result of the schismatic propaganda, for the autonomy movement, which was directed against the political power of the Arabs and their clients, endowed Islam with a profoundly national character.

After the death of al-Kāhinah in 701, the conquest was almost completed. The new rulers, seeking to reorganize the country, imposed a regular tax system. But since the decline of the Roman Empire the population had become used to living in small, independent communities. As early as 720

the Berbers of Ifrīqiya rose up and killed the emir, Ibn al-Ḥabḥāb. In 740 a more serious revolt broke out in northern Morocco and soon spread throughout the whole of North Africa. One of the main rebel chiefs, Maysarah, had lived in Kairouan, where he had come under the influence of the Ṣufriyah, who were Khārijī extremists. Thus the Berbers rose up in the name of those values of justice, equality, and austerity that had been taught by Islam itself but that, in the Berber view, had been betrayed by the Umayyads. In 740, on the banks of the Chelif River, in the center of what is now Algeria, the flower of the Arab aristocracy fell in the Battle of the Nobles (*ghazwat al-asbrāf*). Thenceforth, the western half of the Maghreb was independent. The struggle continued to the east, but no decisive battle was won against the rebels. The new rulers of the empire, the Abbasids, despairing of a rapid victory over this distant province, delegated their authority to Ibrāhim ibn al-Aghlab, a brilliant general who had defended Zāb, in the south of present-day Tunisia, against the insurgents; this event led to the birth of the Aghlabid dynasty within the frontiers of what had been Roman Africa.

The Khārijīs were now in command of the central and western Maghreb, but they soon proved to be incapable of establishing a great state. As proponents of absolute equality, they refused any form of hierarchy or discipline; they accepted without discrimination all those who shared their beliefs. They had a taste for theological controversies and, in case of disagreement over a point of dogma, they would depose their imams and, in some cases, kill them. The principalities that they founded after 754 had shifting frontiers and rudimentary structures. Entrepôt towns such as Tāhart in western Algeria and Sijilmāsah in southwestern Morocco were situated at the junction of the important communication routes between east and west, between the Sahara and the Mediterranean, and as such were busy and prosperous despite their political instability. The state of Barghwāṭah, founded at the same period on the rich Atlantic plains, was just as prosperous, according to travelers in the tenth century; the fruit of the Khārijī revolt, it tended more and more toward a very broad syncretism.

After Khārijīsm, it was Shiism that dominated the political and religious history of the Maghreb. Indeed, the founding of the Idrisid kingdom was probably not fortuitous. There is some evidence for the existence of a real network of Shī'ī missionaries who took to the western routes from Medina or Iraq to spread their good word. They began by questioning students and pilgrims from the Maghreb about the state of mind of their countrymen. If the latter seemed to nurture some sympathy for the 'Alīds and if they were unhappy with their rulers, then a missionary was sent over to find out firsthand what the situation was and perhaps prepare the ground for the arrival of the 'Alīd pretender. The success of Idrīs I encouraged several of the descendants of Ḥasan ibn 'Alī to follow his example. In the middle of the eleventh century, nearly a dozen Ḥasanid princes were estab-

lished in the west of Algeria. Some confined themselves to the role of honored guests, while others were regarded as local chiefs, although their ambitions were limited by the fact that they had no armies. Owing to the presence of so many 'Alīd "guests," Shī'ī ideology was able to permeate Maghrebi society, sometimes replacing Khārijī thought, sometimes combining it with older beliefs to produce strange syncretisms. One example may be found in the region of Ghumārah, south of Tetuan, where a pseudo-prophet called Hā' Mīm founded a separate cult in conjunction with his aunt, Tangīt. The victory of the Fatimids would be incomprehensible without the preliminary activity of the Shī'ī missionaries. The notion of Mahdi (messiah), the dispenser of justice who brings to a close an era of injustice, may or may not have sounded the echo of ancient beliefs, but henceforth it was to become a permanent aspect of the mentality of the Maghreb, before taking on official status with the Almohads.

The Islam that was spread among the Berbers by the schisms now seems to be very unorthodox, but can one really speak of orthodoxy in relation to that far-off time when no remotely hierarchical institution existed? As long as there was no strong state capable of imposing an official ideology throughout North Africa, there was room enough for different interpretations of dogma, and these ultimately deepened the impact of the Qur'anic message. The Fatimids were the first to attempt the political and ideological unification of the Maghreb; the Khārijīs were almost completely eradicated, with the exception of the Mzab region in southern Algeria and Jabal Nafūṣah to the west of what is now Libya, where communities persist down to the present day. It was with the Almoravids that Mālikī Sunnīsm was to triumph, mainly because islamization had already been achieved through the activity of the schismatics.

Literary works. Berber literature has always been basically oral. Berber prophets such as Ṣāliḥ of the Barghwāṭah or Hā' Mīm of the Ghumārah probably employed oral means of communication. Although the eleventh-century Andalusian geographer al-Bakrī asserts that the Barghwāṭah had a Qur'ān in Berber, no trace of this has been found so far.

If no written document exists to shed light on the syncretisms, this is not so for the Khārijīs. After the fall of Tāhart, the survivors fled to Mzab with their sacred books, and in this way two important works were saved. The first, *Kitāb akhbār al-Rustumīyīn* (Memorable Events in the History of the Rustimid Imams), was written by Ibn al-Ṣaghīr (d. 894), who was alive at the time of the events he recorded; the second, *Kitāb al-sīrah wa-akhbār al-a'immaḥ* (Lives and Works of the Imams), is a later work—its author, Abū Zakarīyā', lived in the eleventh century—although it remains within the limits of the period under consideration. Both texts are concerned above all with enlightening the faithful; nevertheless they provide some historical information and clues to the psychology of the Khārijīs in the Maghreb.

The early Shīʿī movement did not leave behind comparable works; it is known only through the prehistory of the Fatimid dynasty as it was recorded by Qāḍī al-Nuʿmān ibn Ḥayyūn (d. 974). This writer was the main ideologue of the Fatimids. In his major work, *Ifṭīḥ al-daʿwah* (Our First Missions), he describes, with remarkable objectivity and accuracy, the region that escaped the political control of the Aghlabids while remaining open to their cultural influence.

The most important works of this period, however, were conceived in Kairouan. Until the eleventh century, profane literature was dominated by émigrés from the East, but local writers won renown in the field of religious culture. At first Ifrīqiyā followed the example of Baghdad and adopted the legal tradition of Abū Ḥanīfah (d. 768), but it soon came to favor that of Mālik ibn Anas (d. 796). What was the reason for this preference? It seems that there were several. Students and pilgrims from the Maghreb went more readily to the Hejaz, Malik's home, than to Iraq, where Abū Ḥanīfah was born. Because he had lived all his life in Medina, Mālik seemed to guarantee greater fidelity to the tradition of the Prophet. Many of the inhabitants of the Maghreb wished, perhaps unconsciously, to dissociate themselves from the East but without falling into the schisms. Finally, the Mālikī school, which was simpler than the Ḥanafī, was better suited to the society of Ifrīqiyā, which was still predominantly rural and thus relatively homogeneous.

But whatever the causes, the results were of major importance. The Mālikī school in Kairouan took decisive steps toward the ideological unification of the Maghreb. ʿAbd al-Salām ibn Saʿīd, known as Saḥnūn (d. 854), set down in his *Mudawwanah* (a handbook of Mālikī law) the code of the civil society of the Islamic Maghreb. Doubtless many ancestral or even prehistoric customs persisted, but they were judged by reference to the model laid down in the *Mudawwanah*. From now on the Mālikī *faqīh* (jurisprudent) was one of the two most important figures in society. The other was the ʿābid (man of God) who disdained any honors offered him, was always ready to criticize the powers that be, and thus was able to channel popular discontent. The master among these was Buhlūl ibn Rāshīd (d. 799), who, along with others like him, was said to have prepared the blossoming of those brotherhoods (*zawāyā*) that were so characteristic of Berber religiosity. If Sunnism prevailed in the end, it was thanks to men like him, whose example suggested how to influence the government by means other—and better—than bloody rebellion. As the society became more urbanized and more stable, such an example found even greater echoes. These ascetics have not left any written works, but their attitude has been described in detail and their sayings recorded in the *manāqib* (hagiography) literature, beginning with the *Ṭabaqāt ʿulamāʾ Ifrīqiyā wa-Tūnus* (Biographies of the religious scholars of Ifrīqiyā and Tunis) by Abū al-ʿArab Muḥammad ibn Tamīm (d. 944).

When, in the middle of the tenth century, the Kutāmah Berbers inherited a stable, prosperous state that soon gained

its autonomy, they encouraged the growth of a genuinely local literature. The second Zirid emir, al-Manṣūr ibn Buluggīn (984–996), left Raqqādah, the former Aghlabid residence, and went to live in great luxury in Ṣabrā-Manṣūrīyah, where the court life, so typical of Islamic civilization, favored the development of *ādāb* (profane literature). Here may be mentioned the names of three men whose fame extended far beyond the frontiers of Ifrīqiyā. Ibrāhīm ibn al-Raqīq (d. 1027) was chancellery secretary and a committed Shīʿī; his vast historical work, *Taʾrīkh Ifrīqiyā wa-al-Maghrib*, served as a reference for all subsequent chroniclers, although very little of it has come down to the present. Muḥammad ibn Saʿīd ibn Sharaf (d. 1067) was known as both a poet and a historiographer; his treatise of literary criticism, *Masāʾil al-intiqād*, has been translated into several European languages. Ḥasan ibn Rashīq (d. 1064), a poet and anthologist, has left to posterity a book of rhetoric (*Kitāb al-ʿumdaḥ*) that is remarkable for the depth of its analysis and the elegance of its style.

The mosques of Kairouan and Sousse, the remains of the palace in Raqqādah, the fortresses of Belezma and Baghāʿī, the citadels of Sousse and Monastir, all bear witness to the wealth of the reigning dynasties and the adaptation of Islamic art to North Africa. The architecture of this period resulted from a harmonious symbiosis of the Byzantine heritage, the influence of Abbasid Iraq, and a spirit of sobriety that was expressed in the asceticism of a man such as Buhlūl.

THE BERBER PERIOD. The culture of Ifrīqiyā reached its peak in the eleventh century and then spread throughout the Maghreb as a result of the unifying policies of the Almoravid, Almohad, and Marinid dynasties. For want of a better name, the three hundred years from the mid-eleventh to the mid-fourteenth century, when supreme power was in the hands of the Berber dynasties, is known as the Berber period, but the term is as unsatisfactory as the adjective *Arab* that this article applied to the previous three centuries. Indeed, neither arabization nor islamization had been halted, and on the contrary, it was in this period that they reached the point of no return.

The three Berber dynasties practiced an imperial policy aimed at the unification of the Maghreb; although this attempt failed in the end, it left indelible traces. In the eleventh century there was an obvious difference between the eastern and western halves of the Maghreb. The former was Arab in culture and politically unified, while the latter was fragmented into numerous principalities that were fought over by the rulers of Cordova and Kairouan. Maghrāwah and Mīknāsah, alternately serving the interests of one and the other, wore themselves out in a series of fruitless conflicts. Quite suddenly and for various reasons, the caliphate of Cordova disappeared in 1031, and the Zirid and Hammadid emirates in 1052; with this vacuum on the North African political scene, the time of the western Maghreb had come. The Almoravid Lamtunah, starting from the Atlantic region of the Sahara, built an empire around Marrakesh (founded in 1062); this

empire, which lasted until 1146, stretched from Andalusia to the Sahara and from Algiers to the Atlantic. The Almoravids were replaced by the Almohads, whose main strength came from the Mašmūdah of the High Atlas; extending the empire they had inherited as far as Tripoli, they reigned in Marrakesh until 1276 and, under the name of the Hafsiids, in Tunis until 1573. Then came the turn of the Zanātah shepherds from the borders of Algeria and Morocco, who, as the Marinids and then the Wattasids, reigned in Fez until 1550 and, as the Zayyanid-ʿAbd al-Wadīds, in Tlemcen until 1554.

Unlike the Kutāmāh, the Berber groups from the western Maghreb had not set out at the call of an Arab refugee. In both cases, however, the seizure of power by a Berber dynasty was accompanied by cultural Arabization that owed its fast pace to the luxurious life of the court. Ethnic Arabization was intensified too, because the Banū Hilāl Bedouins, who were responsible for the fall of the Zirid and Hammadid emirates, continued to emigrate to the Maghreb right up to the fifteenth century; the last to arrive, the Banū Maʿqil, Arabized the province of Shangīṭ, which lies to the north of what is now Mauritania.

The Almoravid movement. One of the leaders of the Lamtūnah, on his way back from a pilgrimage to Mecca, attended the lessons given by Abū ʿImrān al-Fāsī, a famous man of law from Morocco. “My countrymen,” he told the teacher, “know nothing of true Islam and have need of a guide. Who would you recommend?” Abū ʿImrān replied, “Go on my behalf to see Wajjāj, who knows your region well.” Wajjāj in turn directed the Lamtūnah chief to a *faqīh* from Sijilmāsah called ʿAbd Allāh ibn Yāsīn. When they got back to the Sahara, the warrior chief and the missionary founded a *ribāṭ* (monastery) where the future leaders of the movement gathered together; for this reason they were given the name *al-murābiṭūn*, transformed by the Spanish into Almoravids. Later, under the leadership of Yūsuf ibn Tāshfīn, the disciples of Ibn Yāsīn set out to conquer a vast empire.

This story closely resembles that of Abū ʿAbd Allāh, the Fatimid *dāʿī*, apart from the fact that this time the missionary was Sunnī. The Almoravid movement in the West, like the Seljuk movement in the East, belonged to the vast counteroffensive launched by the Abbasids in the eleventh century to destroy Shiism and repel the Christian crusade. One of the spiritual fathers of the movement, the Mālikī *qādī* al-Bāqillānī (d. 1013), was Abū ʿImrān’s teacher, and it was with the blessing of the great jurists of the East that Yūsuf ibn Tāshfīn overthrew the Andalusian princes and took the title of Amīr al-Muslimīn (“commander of the Muslims”), which symbolized his supreme authority in the Muslim West under the suzerainty of the Abbasid caliphs.

In the new Almoravid state the *faqīhs* held pride of place. Chosen from among the early adherents of the movement, they set out to defend and spread the official ideology. They gave advice to local emirs, kept a close watch on the verdicts of the courts, preached asceticism to the governed

and austerity to the governing. Qādī ʿIyād of Ceuta (d. 1149) was the embodiment of this clerical caste. He left many works, two of which were of considerable importance. His *Shifāʾ* (Book of Healing), which draws a complete portrait of the Prophet, simultaneously gives readers an example to follow at every moment of their lives, thus proving that, contrary to Shīʿī thought, they had no need of an imam to guide them to the truth. In the *Kitāb al-madārik* (Book of Exploits), he drew up a long list of the celebrities of the Mālikī school. This book completed the work that Abū al-ʿArab had begun by putting together what can be considered a veritable patology of Maghrebi Islam.

However, in spite of the wholehearted support of the state, Mālikī preeminence was short-lived, and with the coming of the Almohad dynasty the Maghreb was once more to experience a schism. Official Almoravid ideology seems to have lagged behind the sociointellectual evolution of the rest of the Islamic world. Whereas in the East, thanks to al-Ghazālī (d. 1111), Sunnism had succeeded in integrating dialectical theology (*kalām*), logic (*manṭiq*), and mysticism (*taṣawwuf*); and while in Andalusia, Ibn Ḥazm (d. 1064) was pioneering new directions in juridical thought, the Mālikīyah of the Maghreb remained blindly attached to the school of Kairouan and refused any kind of reform. When in power they applied a reactionary policy in the true sense of the term, refusing to systematize the *fiqh* in the manner of al-Shafīʿī (d. 820), condemning and burning all the works of al-Ghazālī, and declaring war on popular piety. They formed an isolated, activist minority that refused the spirit of the *sunnah*, that is, to choose the middle way and always seek the consensus of the majority. It was not until they had suffered bitterly from the persecution of the Almohads that they discovered the virtues of moderation.

The Almohads. From a political point of view, the Almohad century represented the apogee of North African history, but from a religious point of view it was simply an interlude. The official ideology, which from the very beginning had been opposed by the *ʿulamāʾ* and later was to be seen as schismatic by a majority of the population, was eventually repudiated by the descendants of those who had established it in the first place. How can its appearance be explained? Was it a belated offshoot of earlier schisms? An original creation stemming from the Berber mentality? A national religion comparable with what was to become Twelver Shiism in Persia? All of these remain questions without answers.

Muḥammad ibn Tūmart, the Almohad ideologue, unlike Ibn Yāsīn, was not the propagandist of a movement that was external to his native region. Toward 1107 he left southern Morocco for Cordova, where he immersed himself in the teachings of Ibn Ḥazm, then traveled on to Iraq where, according to some biographers, he may have met al-Ghazālī. About 1116 he began to return homeward, stopping off for a long time in Alexandria, Tunis, Bougie, Tlemcen, Fez, and Meknes. In each of these cities he set himself up as the arbiter of morals, antagonizing the local authorities but gaining dis-

ciples who, like ‘Abd al-Mu’min al-Gūmī, became fanatical followers. When he arrived in the Almoravid capital of Marrakesh, he challenged the *faqīhs* and led them into theological controversies for which they were ill prepared. An advocate of strict monotheism (*tawḥīd*) who made no concessions to popular imagination, he accused his adversaries of anthropomorphism (*taj̄sīm*). In fact, *Almohad* is a Spanish distortion of the Arabic *al-muwahḥid* (“unitarian”).

Expelled from the capital in 1121, Ibn Tūmart took refuge in Tinmal in the High Atlas; there, surrounded by his followers, and with the support of the Hintātah Berbers, a clan of the Maṣmūdah, he put himself forward as a candidate for the imamate. He spent seven years organizing a veritable revolutionary army, then set out in 1128 to attack Marrakesh. The Almoravid empire was still in the prime of youth, and the attacking army was repelled with serious losses, although Ibn Tūmart’s forces were able to regain a place of refuge without being pursued. Ibn Tūmart died soon after this defeat, but he left behind him a perfectly tuned instrument of warfare. His successor, ‘Abd al-Mu’min, had only to choose tactics of attrition to overcome the power of the Almoravids.

Ibn Tūmart was closely involved in the ideological training of his disciples and for their benefit wrote a series of theological texts that have come down to the present. Like the Khārijīs, he held that faith (*imān*) should not be passive, and he believed that he had to actively follow good and fight against evil. Like the Mu’tazilah, he defined the divine attributes in strictly rational terms, with recourse if need be to *ta’wīl* (allegorical interpretation). As the leader of an independent school, he applied *ijtihād*, following his own opinions without reference to a particular legal school. As a pretender to political power, he claimed ‘Alid ancestry and presented himself as the infallible imam (*ma’šūm*), the Mahdi whose coming had been so long awaited by the weak and the oppressed. Here one is far from the Mālikī school, but the only point that was really unacceptable to a Sunnī Muslim was the doctrine of infallibility, and this was to be abandoned in Marrakesh in 1229 and later in Tunis by the Hafṣids. If Ibn Tūmart had contented himself with claiming the right to *ijtihād*, the *faqīhs* would have been able to do no more than question his abilities, without ever going so far as to condemn him for heresy.

The arrival of a man such as Ibn Tūmart in a region that was so far from the great cultural centers shows to what extent the Maghreb had been Islamized; however, it would be a serious error to consider the Almohads a purely local phenomenon; their ideology expressed a general desire to go beyond the narrow legalism of the Mālikī school, to apply logic to both law and theology. This was in fact achieved in the following century. To the extent that there is today a homogeneous Maghrebi people, in spite of their internal diversity, this is the result of the policy of the Almohad caliphs. Ibn Tūmart owed his victory to the support of the Maṣmūdah in the Moroccan High Atlas, who were then to play a leading

role in the empire. However, his successor, Caliph ‘Abd al-Mu’min, came from western Algeria, and, according to the chroniclers, he brought forty thousand of his countrymen with him to Morocco in order to reinforce his personal power. During his later campaigns, when he came up against the Zanātah, Arabized Berbers migrating along the Algerian-Moroccan borders, he moved them to the regions of Meknes and Taza; he likewise sent the Banū Hilāl, Arab Bedouins from Ifrīqiya, to the Atlantic plains. He imposed military service on both groups and in return granted them *iqṭā’*s, tax farms for vast tracts of land. Thus there came into being a caste of soldiers who were superimposed on the local population and who brought with them their Arab culture and language. In this way the Arabization of the plains and plateaus of the Maghreb was completed. Both toponymy and anthroponymy bear witness to the fact that the same groups were to be found everywhere.

This period also saw the development of a pietistic religious movement that had its origins in Almoravid times. Encouraged by the victory of the Almohads, it was nonetheless distinguished from them from the beginning by its aims and methods. Ibn Tūmart’s intellectualism was permeated with great fervor, and yet its austerity left no room for the religious sentimentality that the people doubtless needed. Numerous ascetics left for the countryside to spread the word of God to the people in a colorful language that was simple enough to be understood by the least educated. Only a very few of them were real *faqīhs*, and some were even quite uneducated, but they were all men of God. They settled in lodges (*zāwiyahs*) far from any town, where they spent their days in prayer and meditation. For the scattered populations that still had no fixed homes, these lodges became centers where they could gather, and in fact they were the forerunners of what are today the *mawasim* (annual fairs; sg., *mawsim*). The biographies of these men, the greatest of whom was ‘Abd al-Salām ibn Mashīsh (d. 1128), can be found in the *Tashawwuf* of Ibn al-Zayyāt. It was with this movement that Islam truly became the culture of the people of the Maghreb.

Two centuries later than Ifrīqiya but on a larger scale, the western Maghreb in its turn witnessed a court life that was to familiarize it with Arab-Islamic civilization. By emulating the Andalusian émigrés, Moroccans such as Abū Ja’far ibn ‘Aṭīyah (d. 1158), Ibn Ḥabbūs (d. 1174), and Aḥmad al-Jarāwī (d. 1212) distinguished themselves in the field of profane literature. A school of historiography also came into being, and through it are obtained the first glimpses of the interior of the western Maghreb. The most important authors in this field were Ibn al-Qattān, who lived during the reign of Caliph al-Murṭadā (1248–1266), ‘Abd al-Wāḥid al-Marrākushī (d. 1230), and Ibn ‘Idhārī (d. after 1213). For the first time, too, a Maghrebi capital, Marrakesh, could be compared with Cordova or Cairo. The celebrated Andalusian philosophers and jurists Ibn Ṭufayl (d. 1185) and Ibn Rushd and Ibn Zuhr (who both died in 1198) lived there for many years and wrote some of their most important

works there. During the Almohad period the art of the Maghreb reached the height of its greatness and harmony. Rigor, sobriety, and modesty were the characteristics ascribed to the ideology of Ibn Tūmart and to the collective psychology of the Maghrebi people.

The post-Almohad period. The Almohad empire, exhausted by its wars in Andalusia against the combined forces of Christendom, finally gave way to three dynasties that divided the North African territory among themselves. Under the descendants of Abū Ḥafṣ ʿUmar, one of the first disciples of Ibn Tūmart, Ifrīqiyā once more became autonomous within its former frontiers. The Hafids remained loyal to Almohad ideas for a certain time, then dissociated themselves and were reconciled with the Mālikī ʿulamāʾ. The rest of the Maghreb was shared between two Zanātah groups: the Marinids in Fez and the Zayyanids in Tlemcen. The Marinids, who considered themselves the sole rightful heirs of the Almohads, attempted to rebuild the empire but failed, and after 1350 the three dynasties coexisted more or less peacefully.

The Maghreb of the fourteenth century was homogeneous. Various names were used for what was in fact the same political organization, the Almohad *makhzan* (state government) that had been directly inherited by some and copied by others. The army was dominated everywhere by the Banū Hilāl, the bureaucracy by the Andalusian émigrés who brought with them their refined system of etiquette. The retreat of the Andalusians from Spain marked the third step in the cultural arabization of the country. Fashions in dress or cooking, language, music, architecture, decoration, all the framework of a certain kind of middle-class existence, still bear witness to this cultural influence today. The same names, the same customs, the same way of speaking are to be found in Fez, Tlemcen, and Tunis.

The failure of Ibn Tūmart's extremism left the field clear for a renewed Sunnism that was both faithful to the heritage of the past and open to the new questions that the Almohad crisis had brought to light. The Marinids, who had no ideological pretensions, took the advice of the ʿulamāʾ and, following the example of the Seljuks in the East, set up *madrasabs*, colleges where the Islamic disciplines were taught from an orthodox viewpoint. These were immediately copied by the Zayyanids and Hafids. The teaching was organized by the authorities, but its content was defined by the consensus of the ʿulamāʾ, based on a tradition that was nurtured by the vast body of biographical literature of the *ṭabaqāt*. The growing number of pupils led to a need for manuals; thus began the era of dry, hermetic summaries that soon required long commentaries (*shurūḥ*). This was perhaps an inevitable development, but one that turned out to be negative in the long run.

Official Islam. As the reigning dynasties grew weaker, the ʿulamāʾ, without ever becoming truly independent, gained more power and put the finishing touches on an official ideology that was characterized by moderation, simplicity,

and positivity. For a long time Sunnī Islam had been faced with a precise problem: the rationalization of law, theology, and mysticism. The Zāhirī and Shāfiʿī jurists claimed that it was possible to reduce the various Qurʾānic dictates to a few laws. The Muʿtazilī and Ashʿarī theologians wanted to derive all the attributes of God from a single principle. The mystics of the school of Ibn ʿArabī (d. 1240) justified their metaphysical monism with the desire to be identified with God. The Mālikī *faqīhs*, taking a completely different viewpoint, considered this attempt at systematization useless methodological extremism. For them, Islam is above all a divine order (*amr*) that is self-evident. The duty of the Muslim is to obey this order; hence the cardinal importance of the notion of *bidʿah*, innovation in regard to ritual. The Prophet is by definition the perfect believer; why go beyond what he taught his followers? Does this not imply either that he was not perfect or that he did not transmit faithfully the message of God?

Because Islam is above all a *sharīʿah* (law; lit., “path”), *fiqh* is the central discipline in Islamic science. The community can always do without theologians and mystics, as in Medina at the epoch of the Prophet, but it cannot live without *faqīhs*, who form an integral part of the governing elite. And because *fiqh* fills a social need, it must be founded on a simple *ʿaqīdah* (profession of faith), that of the *salaf* (“ancestors”); any attempt to complete it or to clarify it would lead inevitably to endless dissension. *Fiqh*, the constitution of the Muslim community, is a positive element and must be accepted as such; it is justified by the will of God, which is itself inseparable from the final good of humanity.

Such an attitude is easy to understand in the light of the disastrous consequences that partisan rifts have had throughout the history of Islam, but it is impossible to ignore the fact that as this attitude became more widespread, it tended to discourage any form of intellectual curiosity. Indeed, the last achievements in the exact and natural sciences date from no later than the fifteenth century in the Maghreb.

The history of the Maghreb seems to come to a standstill at the moment when Islam assumed its definitive characteristics. Contemporary scholars were aware of this and attempted to record, in encyclopedic form, the knowledge handed down from past centuries. One such example in the field of law is the *Miʿyār* (Norm) of al-Wansharīsī (d. 1508). Ibn Khaldūn (d. 1406), the greatest thinker ever produced by the Islamic Maghreb, also endowed his famous *Muqaddimah* (Prolegomena) with an encyclopedic content. This work was the conclusion of a deep reflection on the history of the Maghreb, widened to include the entire Arab-Islamic past. The author, who had been a serious student of Greco-Arab philosophy and who was personally inclined toward mysticism, nevertheless remained absolutely faithful to Mālikī methodology. In two brilliant chapters of his main work, he contrasts the positivism of *fiqh* with the rationalism of *kalām* on the one hand, and the monism of mysticism on the other. More important, he reveals the sociological basis

for such a contrast: Universal history, according to him, had evolved from *‘umrān badawī* (rural civilization) to *‘umrān madanī* (urban civilization). In the Maghreb the two kinds of culture exist side by side, resulting in a structural dichotomy. In the city, society tends naturally toward a religion of reason, whereas rural society upholds a naturalist religion: The sultan (the political authority) plays the role of mediator between the two forms of social life; his official ideology, Mālikī *fiqh*, must necessarily remain at an equal distance from rationalism and naturalism, hence its qualities of positivism and moderation.

THE ISLAM OF THE ZĀWIYAHs. During the fourteenth and fifteenth centuries the Maghreb underwent a general crisis. Nomadic life spread at the expense of a ruined agriculture; commerce languished and plunged the cities into profound inactivity. The Spanish and the Portuguese, masters of the seas, conquered many ports on the North African coasts. Faced with such unfavorable developments and already weakened by incessant wars, the three reigning dynasties collapsed.

The Ottoman Turks. This period began with the Portuguese seizure of Ceuta in 1415 and ended with the defeat of the Spanish in Tunis in 1574, and of the Portuguese in Wādi al-Makhāzin near Larache in 1578. Morocco was saved by an outburst of nationalism, the rest of North Africa by the Ottoman Turks.

Ottoman sovereignty theoretically persisted in Algeria until 1830, in Tunisia until 1881, and in Libya until 1911. However, from 1710 on, each of these provinces gained its autonomy. The official language was Turkish, but Arabic remained the language of culture. The Ottomans reintroduced Ḥanafī law into the Maghreb; the resulting competition with Mālikī law rekindled interest in long-neglected disciplines such as *uṣūl al-fiqh* (fundamental principles of law) and *kalām*. In Morocco, under the new Sa‘īd dynasty, the social and political scene was dominated by the Ṣūfī brotherhoods.

The marabout movement. Popular pietism, which had been launched under the Almoravids and the Almohads, covered the country with a network of *zāwiyahs* where ascetics lived—in theory at least—cut off from the world. In reality they taught children and even adults the rudiments of religion; they used the offerings they received from the population to help the poor and give shelter to travelers; in cases of conflict they served as mediators. The person who was called *ṣāliḥ* (man of good works), *walī* (man of God), *sayyid* (lord), and *shaykh* (leader) had become an indispensable figure. The last two terms indicate that he was endowed with a spiritual authority that the *qā’id* (representative of the central powers) could not easily ignore.

Up to this time the *zāwiyahs* fulfilled a social need and completed the work of the *makhzan*. When the latter turned out to be incapable of getting rid of the Portuguese who had settled on the coasts, the *zāwiyahs* were transformed into

ribāṭs, rallying centers for warriors. (Here the word *murābiṭūn*—as with Almoravids earlier—yields *marabout* in French and English.) The man who symbolized this transformation was Muḥammad ibn Sulaymān al-Jazūlī, the author of a celebrated book of prayers concerning the Prophet called *Dalā’il al-khayrāt* (The Signs of Blessings); his *zāwiyah* was located in Afūghvl, near present-day Safi. He died in 1465, before the Portuguese occupation of the city, but his disciples, who later led the struggle for freedom, considered that he had prepared them spiritually for their task. All the *zāwiyahs* founded later were linked to al-Jazūlī and, through him, to ‘Abd al-Salām ibn Mashīsh.

The marabout movement was based on the legacy of several centuries. To the tasks of education and moral reform it added a political program—the struggle against foreign domination—and this was its originality. The majority of its leaders prided themselves on being *sharīfs* (descendants of the Prophet through his daughter Fāṭimah); victory over the invaders gave them a social importance that was based on an assumption of holiness (*barakah*). From this time on, being a marabout and being a *sharīf* were closely linked in the eyes of the people if not in reality.

FROM BROTHERHOOD TO PRINCIPALITY. The parent *zāwiyah*, which was a center for teaching and meditation, trained missionaries whose task was to spread the good word far and wide. The followers gathered in a special chapel, also known as a *zāwiyah*, to recite their *wird* (“litany”). Thus the *ṭarīqah* (brotherhood) came into being. With the weakening of the central power and the gradual splitting up of the country, the people turned more and more to the shaykhs of *zāwiyahs* who thus became, sometimes much against their will, the new political leaders. Similar circumstances surrounded the birth of the great North African brotherhoods: the Nāṣirīyah and Wazzānīyah in the mid-seventeenth century, and the Darqāwīyah, Tijānīyah, and Sanūsīyah during the nineteenth century. The *zāwiyah* thus took on diverse forms: it could be a monastery, brotherhood, or principality. On the one hand, it united the faithful over and above their traditional splits; on the other hand, it created new splits with its activism. In fact the *zāwiyah* competed with the political authority and the clerical institution on their respective grounds. In the eyes of his disciples, the shaykh was in possession of a beneficial power that enabled him to work wonders (*karāmāt*). When he died he became the object of a cult (*ziyārah*) because of his power of intercession (*shafā’ah*). From the point of view of its organization, the brotherhood had something of a secret society or, at the very least, a private club about it. The principle of the brotherhood posed a problem for orthodoxy. However, until the beginning of the nineteenth century, every inhabitant of the Maghreb, literate or illiterate, was a member of one or several of them. Because it was a family affair, women and children were included in the brotherhood even if they did not usually participate in the ceremonies. The authorities and the clerics were unable to rise up openly against such a widespread practice.

The *zāwiyah* and the naturalist substratum. Each brotherhood produced a vast body of hagiographic literature listing the qualities that placed its successive leaders among the chosen and omitting any details of their behavior that were not quite orthodox. Nevertheless the official religious hierarchy remained suspicious. What was the true practice of the *zāwiyah*? Those who knew it from the inside were sworn to secrecy, while those who remained outside could say nothing with authority. Were the old pre-Islamic cults lingering on in the *zāwiyahs*? The Sunnīs insinuated that this was so but were unable to produce solid proof. And in any case, even if the naturalist cults were kept up in secret, they were reinterpreted in an Islamic language. The notions of *barakah*, *karāmah*, *shafā'ah*, and *sirr* ("secret") were directly linked to the teachings of the Prophet.

For three centuries the Islam of the brotherhoods, characterized by faith in hereditary grace, a supererogatory cult, and a hierarchical organization (which related it to the Shi'ī *da'wah*), dominated the scene in the Maghreb so overwhelmingly that any outside observer took it for the true Islam, with the doctrine of the jurists being mere rationalization. Later history showed that this was not the case. From the mid-nineteenth century on, scriptural Islam returned in force; then began the long struggle against the *zāwiyahs* that finally brought them into disrepute. And yet one question remains: If the brotherhoods were so popular, was it not because they fulfilled an affective need that official Islam was unable to satisfy? Whatever the case, they gave rise to a renewal of literary expression. Whereas classical Arabic poetry (the *qaṣidah*, "ode") was becoming bogged down in a welter of archaisms and stylistic artifices, the new emotionalism that emerged from the brotherhoods gave rise to *malḥūn*, poetry in the spoken language that was meant to be sung. Created by artists versed in the subtleties of classical prosody, *malḥūn* produced genuine masterpieces.

THE ISLAM OF THE SALAFIYAH. Throughout the Maghreb, the second half of the eighteenth century was a period of recovery. The power of the central authority was reinforced, trade revived, and the cities prospered again. At the same time as did the Wahhābiyah of Arabia, the *faqīhs* of the Maghreb began to criticize the most absurd aspects of popular religiosity. Their movement claimed to continue the inspiration of the first Muslims (*salaf*), hence the name Salafiyah conferred on it by historians.

Pre-Salafiyah and Salafiyah. The Salafiyah were not the first reformers to appear in the modern history of Islam, so how can they be distinguished, apart from chronology? The 'Alawid sultans of Morocco, Muḥammad III (d. 1790) and Sulaymān (d. 1822), seeking to return to a simpler form of religion, criticized the subtleties of the jurists and the supererogatory practices of the brotherhoods. Muḥammad ibn al-Madanī Gannūn (d. 1885) spoke out vehemently against music and ritual dances. The book written by Ibn al-Ḥājj (d. 1336) against all kinds of innovation, *Al-madkhal* (The Introduction), was reprinted, and numerous clerics pub-

lished summaries of it. Thus, from the mid-eighteenth century on normative Islam began to regain control, but it was in the minority and it attacked only the most aberrant aspects of the marabout movement, never its basic tenets. This phase is what this article shall call the pre-Salafiyah.

The Salafiyah in the proper sense of the term appeared at the end of the nineteenth century, when several Arab countries, including Algeria (in 1830) and Tunisia (in 1881), came under the yoke of European imperialism. The movement expressed an awareness of the failure of traditional Islamic society in the face of foreign domination, as well as a desire for radical reform in the intellectual and social domains. From this standpoint the Islam of the *zāwiyahs* appeared as a distortion of true Islam, an alteration that lay at the origin of the decadence of the Muslims. The Salafiyah declared total war on maraboutic Islam.

The North African Salafiyah formed part of the movement that had been launched by the pan-Islamic leader Jamāl al-Dīn al-Afghānī (d. 1897) and his Egyptian disciple Muḥammad 'Abduh (d. 1905). The review *Al-'urwah al-wuthqā* (The Strongest Bond), which they published for a short time in Paris, was widely read by enlightened Tunisians. 'Abduh himself stayed briefly in Tunisia and Algiers in 1901/2. The Cairo review *Al-manār* (The Lighthouse), launched at 'Abduh's instigation in 1898 by his disciple Rashīd Riḍā, had an immediate influence on the pupils of the *madrasahs*. It shaped the minds of such future leaders of Islamic reformism as the Tunisian Bashīr Ṣfar (d. 1937), the Algerians Ṭayyib al-'Uqbī (d. 1962) and 'Abd al-Hamīd ibn Bādīs (d. 1940), and, to a lesser extent, the Moroccans Abū Shu'ayb al-Dukkālī (d. 1940) and al-'Arbī al-'Alawī (d. 1962).

The critique of the *zāwiyahs*. In 1937 the Algerian Mubārak al-Mīlī (d. 1962) published a pamphlet called *Risālat al-shirk wa-mazābirih* (Aspects of Polytheism), in which he summarized the main criticisms leveled by the Salafiyah against the brotherhoods. From the point of view of faith, he argued, the practices of the brotherhoods are tainted with *shirk* ("associationism"). Those who give offerings believe that this is the price to be paid for the intercession of the patron saint of the *zāwiyah*. However much the shaykh maintains that it is God alone who really intervenes, the donors still believe that it is the saint; they associate another being with God and thus commit the worst of sins.

From a legal point of view, the brotherhood is an innovation. Its members frequent a chapel, not a mosque, and this in order to recite prayers rather than the Qur'ān; they fast during periods other than the month of Ramaḍān and go on pilgrimages to places other than Mecca. According to the Salafiyah, this is a cult that has elements in common with Islam and yet is distinct from it. New *zāwiyahs* are created every day, and the Muslim community, instead of being united around the Qur'ān, is splitting up into sects that rise up against one another. Finally, from a social point of view, the *zāwiyah* is a school of *taqlīd* (the act of following blindly)

and *tawakkul* (fatalism). The disciple follows the shaykh in the belief that he can work wonders. Thus parasitism is encouraged. The *zāwiyah* is indeed active, but only in that it recruits people and takes them away from a productive life. In short, for the Salafīyah the *zāwiyahs* divide the Muslims, disarm them morally, impoverish them economically, and enslave them spiritually. They mark a reappearance of the paganism (*jāhiliyyah*) that the Prophet had fought against. A return to the religion of the one God is a return to freedom, to a sense of action and solidarity, in other words, to the qualities responsible for the greatness of the ancestors.

From Salafīyah to nationalism. The Salafīyah were at work in a Maghreb that was dominated by European colonialism; they were not members of the *‘ulamā’*, even if they had been taught in such traditional institutions as the Zaytūnah in Tunis or the Qarawīyīn in Fez. They were fighting above all against the leaders of the *zāwiyahs*, but they also criticized the *faqīhs* who, prudently favoring middle-of-the-road solutions, had little liking for their vehemence. The Salafīyah drew their strength from the anticolonialist feelings harbored by the majority of the North African people. In response to the question “Why have we been colonized?” the Salafīyah gave a forceful answer: “Because we have been morally disarmed by the brotherhoods.” The reply to this criticism came from Aḥmad ibn ‘Aliwah (d. 1934) in Algeria and from Aḥmad Skīraj (d. 1944) in Morocco, but because it was purely religious in form it caused little stir.

The triumph of Salafīyah can be explained by the social and political environment of the time. As the cities became poorer, the Islam of the brotherhoods predominated. Then, during colonization, the cities recovered their prosperity and gave rise to a new merchant class whose lifestyle owed nothing to the practices of the *zāwiyahs*. It was from this class that Salafīyah drew the strength that enabled it to confront the colonial administration, the shaykhs of the brotherhoods, and the prudent *‘ulamā’*. However, because it was at once a religious and a sociopolitical movement, the Salafīyah had to follow the same evolution as the society, which, becoming ever more urbanized and politicized, obliged it to merge first with liberalism, then with nationalism, and finally with socialism. In this way the movement lost its specificity, as illustrated by the careers of ‘Abd al-‘Azīz al-Tha‘ālibī (d. 1937) in Tunisia and ‘Allāl al-Fāsī (d. 1974) in Morocco, who began as Salafī thinkers and wound up nationalist leaders.

POLITICAL ISLAM. In the present-day Maghreb, the state completely dominates both the society and the individual. Traditional institutions—*madrāsahs*, *zāwiyahs*, *ḥabūs* (religious foundations)—are under the close supervision of their respective ministries. In Morocco the *‘ulamā’*, organized on a national level in a *jam‘iyat ‘ulamā’ al-Maghrib* (Moroccan ‘Ulamā’ Association) and in each province in a *majlis ‘ilmi* (‘Ulamā’ Council), are consulted on questions concerning dogma or the life of society in general, but they are allowed no say whatsoever in political affairs. In Algeria, the FLN (National Liberation Front), the sole political party, monop-

olizes public activity by law; in Tunisia, it is the dominant PSD (Destourian Socialist Party); in Libya, the people’s committees, while the *‘ulamā’*, are no more than civil servants.

The new dichotomy. After their liberation from the colonial yoke, the states of the Maghreb adopted the Salafī position as their official ideology. What has become of the Islam of the *zāwiyahs*? Scholars do not agree on this subject. The religious evolution of the Maghreb seems to have followed two quite separate paths. On the one hand, there are the Khārijī and Shī‘ī schisms, which, containing elements of prehistoric polytheism, influenced the Almohads and the practices of the brotherhoods; on the other hand, there is strict monotheism, expressed at first through the Kairouan Mālikīyah, later redefined by the Sunnism of the thirteenth and fourteenth centuries and revived by the modern Salafīyah. This dichotomy could explain Ibn Khaldūn’s opposition between rural and urban civilization. If so, the growing urbanization and industrialization of the independent Maghreb, which requires an increasingly rationalist religiosity, constantly reinforces the Salafīyah to the detriment of residual naturalist practices.

However, urbanization itself creates new needs. The city is never wholly middle class; it also contains a subproletariat that remains close to its peasant roots and an intelligentsia that is socially mixed and vulnerable to unemployment. The former group (the women in particular) indulges in magical practices, while the latter zealously seeks out mystical emotion or political activism. Under these circumstances, there could well be a revival of the *zāwiyahs*, but they would be used to fulfill a role that is defined more by present needs than by the legacy of the past. This fact is common to all the great cities in the world.

Political temptation. The Salafī ideology, which is spread among the masses by the machinery of the state, retains its original activist character. As the state is not always faithful, in practice, to Qur’anic prescription, individuals who adopt this ideology find themselves on the horns of a dilemma: Either they envisage it as a purely spiritual exercise or they derive a program of political reform from it. Now this dilemma is not confined to the Maghreb; it takes on a particular form only to the extent that religious experience in the Maghreb has distinct features.

North Africa has never produced intellectual mystics like the Andalusian Ibn ‘Arabī, the Egyptian Ibn al-Fārīd (d. 1235), or the Persian Jalāl al-Dīn Rūmī (d. 1273); rather, it is a land of ascetics, educators, missionaries, and *mujāhidhs* (warriors of the faith), all of whom were close to the ordinary people and sensitive to the problems of the community. In the same way the great Mālikī *‘ulamā’* were inclined to practicality and moderation, with little concern for methodological subtleties. It is most significant that the greatest author born in the Maghreb, Ibn Khaldūn, chose as his field of investigation the history and evolution of societies. In the Maghreb more than anywhere else, Islam seems to have been less

individualist and intellectual, much more pragmatic and concerned with the community. One can also assume that it will retain these characteristics in the future, particularly in the absence of any opposing tendency thus far. The practice of the *zāwiyah*, wherever it remains in evidence, is increasingly purified by the 'ulamā'. In people's minds Islam is above all a law (*sharī'ah*) that expresses the solidarity of the faithful, as can be seen in the way the majority is still attached to the fasting at Ramaḍān and the pilgrimage to Mecca. Islam as it is envisaged by the Society of Muslim Brothers (al-Ikhwān al-Muṣlimūn) does have a certain influence on official Salafī thought, but until now it has remained peripheral.

BIBLIOGRAPHY

For a general historical introduction, see Jamil M. Abun-Nasr's *A History of the Maghrib* (Cambridge, 1971) and my *L'histoire du Maghreb: Un essai de synthèse* (Paris, 1970), translated by Ralph Manheim as *The History of the Maghrib: An Interpretive Essay* (Princeton, 1977). The problem of the pre-Islamic substrate is dealt with in François Decret and Muhammed Fantar's *L'Afrique du Nord dans l'antiquité: Histoire et civilisation des origines au cinquième siècle* (Paris, 1981). See also Marcel Bénabou's *La résistance africaine à la romanisation* (Paris, 1976) and W. H. C. Frend's *The Donatist Church: A Movement of Protest in Roman North Africa* (1952; reprint, Oxford, 1971). These are to be compared with ethnographical studies such as Edward Westermarck's *Ritual and Belief in Morocco*, 2 vols. (1926; reprint, New Hyde Park, N. Y., 1968), and Émile Dermenghem's *Le culte des saints dans l'Islam maghrébin*, 4th ed. (Paris, 1954).

Mohamed Talbi's *L'émirat aghlabide 184–296/800–909: Histoire politique* (Paris, 1966) summarizes and criticizes the literature concerning the beginnings of Islam. Roger Le Tourneau's *The Almohad Movement in North Africa in the Twelfth and Thirteenth Centuries* (Princeton, N. J., 1969) gives a brief survey of the work of Ibn Tūmart and his successors. The Almohad organization is described in J. F. P. Hopkins's *Medieval Muslim Government in Barbary until the Sixth Century of the Hijra* (London, 1958). For the *zāwiyahs* see T. H. Weir's *The Shaikhs of Morocco in the Sixteenth Century* (Edinburgh, 1904) and Jacques Berque's *Al-Yousi: Problèmes de la culture marocaine au dix-huitième siècle* (Paris, 1958).

The Salafī movement is studied in depth by Ali Merad in his *Le réformisme musulman en Algérie de 1925 à 1940: Essai d'histoire religieuse et sociale* (The Hague, 1967) and by Arnold H. Green in his *The Tunisian Ulama, 1873–1915: Social Structure and Response to Ideological Currents* (Leiden, 1978). The account given by 'Allāl al-Fāsi in *The Independence Movements in Arab North Africa*, translated by Hazem Zaki Nuseibeh (Washington, D. C., 1954), is an important one. A defense of maraboutism is presented in Martin Lings's

A Moslem Saint of the Twentieth Century: Shaikh Aḥmad al-Alawī, 2d ed. (Berkeley, Calif., 1973).

The anthropological point of view can be found in Clifford Geertz's *Islam Observed: Religious Development in Morocco and Indonesia* (New Haven, Conn., 1968), which uses Weberian concepts, and Ernest Gellner's *Muslim Society* (Cambridge, 1981), which is more structuralist. Dale F. Eickelman's *Moroccan Islam, Tradition and Society in a Pilgrimage Center* (Austin, 1976) is descriptive. Vincent Crapanzano's *The Hamadsba: A Study in Moroccan Ethnopsychiatry* (Princeton, 1973) is more limited in scope. To the list can be added the self-criticism of Paul Rabinow in *Reflections on Fieldwork in Morocco* (Berkeley, Calif., 1977). The present-day situation is analyzed acutely and competently by Elbaki Hermassi in *Leadership and National Development in North Africa* (Berkeley, Calif., 1972) and by Mohammed Arkoun in *La pensée arabe* (Paris, 1975).

ABDALLAH LAROUÏ (1987)

Translated from French by Glyn Thoiron

ISLAM: ISLAM IN ANDALUSIA

Al-Andalus was the name used by the Muslim population of the Iberian Peninsula for the territory that was under Muslim rule from the times of the conquest in 711 CE until the fall of the Nasrid kingdom of Granada in 1492. That territory varied through the centuries. During the Umayyad period (eighth–tenth centuries), Muslims ruled most of the regions of the Iberian Peninsula, with the exception of part of the lands situated north of the river Duero and south of the Pyrenees, where Christians managed to establish small independent kingdoms. A major shift in the balance of power between Muslims and Christians occurred in 1085, when Toledo, the former Visigothic capital, was lost forever to the Muslims when it fell into the hands of the king of Castile, Alfonso VI.

The Muslim conquest of al-Andalus had taken place during the Umayyad caliphate, with its seat in Damascus, and some of the settlers in the Iberian Peninsula were clients of the Umayyads. When the latter's rule was put to an end by the new dynasty of the Abbasids (who moved their capital to Baghdad), a member of the fallen dynasty, 'Abd al-Raḥmān I (r. 756–788), escaped from the massacre of his family and with the help of the Umayyad clients managed to establish himself as ruler of al-Andalus. The new Umayyad emirate had Cordova as its capital. During the ninth century, the Umayyads fought hard to maintain their power in the Iberian Peninsula, shaken by the attempts of Arabs, Berbers, and local converts to establish autonomous political governments. The eighth Umayyad ruler, 'Abd al-Raḥmān III (r. 912–961), succeeded in regaining control of al-Andalus and proclaimed himself caliph in order to give a firmer basis to his rule and to counteract the danger represented by the establishment of a Fāṭimid (Shī'i) caliphate in North Africa, while taking advantage at the same time of the decline of the Abbasid caliphate in the East. Political unity, general stabili-

ty, economic flourishing, and cultural achievements were some of the traits of the tenth century, although the minority of the third Umayyad caliph and the military reforms carried out by his powerful chamberlain, al-Manṣūr ibn Abi ʿAmir, eventually opened the door to civil war.

The conquest of Toledo in 1085 was partly the result of the political fragmentation of al-Andalus that took place during the eleventh century. The administrative centralization achieved during the tenth century disappeared with the collapse of the (second) Umayyad caliphate. It was abolished in 1031, but before that date independent Muslim kingdoms had already arisen, the most important being those of Seville, Toledo, and Zaragoza. With different ethnic backgrounds, the rulers of the so-called Party or Taifa kingdoms were engaged in a complex internal political game of war and peace, in which the intervention of the Christian kingdoms played a major role. Muslim military weakness led to the payment of tribute to those Christian kingdoms. This situation was novel in al-Andalus and almost exceptional in the Muslim world, as the predominant historical experience of Muslims had been until then one of conquest and rule, not of submission to non-Muslims. But money was not a deterrent to Christian military expansion, as became clear when Barbastro and Coimbra fell into Christian hands in the years 1063–1064, followed by Coria in 1079 and Toledo in 1085.

By this time, the need to seek military help outside al-Andalus had become acute and an appeal was made to the Almoravids by some of the Taifa rulers. Of Berber origin, the Almoravid dynasty had succeeded in establishing a unitary kingdom in the Maghreb (nowadays Morocco), having as its capital Marrakech. The powerful Almoravid army crossed the Straits of Gibraltar and defeated the Christians in the battle of Zallaqa (1086), although they were unable to regain most of the territory already lost to the Christians or to retain some major towns (Valencia was in Christian hands from 1094 to 1102, Zaragoza was taken in 1118, Lisbon in 1147, Tortosa in 1148). Almoravid political legitimization revolved around the abolition of illegal taxes and the pursuit of holy war (*jihād*). As this program failed, the support the Almoravids had attracted both among the elites and the masses of al-Andalus declined and by the third decade of the twelfth century, political and religious movements aiming at autonomous government had begun in several towns, shaking Almoravid rule in al-Andalus. The Almoravids were facing, at the same time, a new religious movement in their Maghrebi territory, that of the Almohads, who threatened Almoravid power both politically and ideologically.

The Almohad movement was founded by the Berber Messianic reformer Ibn Tumart; his successor as political leader was also a Berber who adopted an Arabic genealogy in order to proclaim himself caliph. The movement started in the south of Morocco in the first decades of the twelfth century, expanding from there to dominate the whole of the Maghreb (Morocco, Algeria, Tunisia) and al-Andalus. Aim-

ing at a radical political and religious revival, the Almohads found support among disparate groups in Andalusian society who shared some of their puritanical reformist policies, although it was mostly the use of violence that helped them suppress, at least for some time, the opposition of those groups and individuals that either disagreed with their program or were against its more extremist aspects. Although the Almohads were able for some time to check Christian military advance, their armies suffered a major defeat in the battle of Las Navas de Tolosa in the year 1212. This defeat had been preceded and was followed by the loss of major towns in what was left of al-Andalus: Silves was conquered in 1190, Cordova in 1236, Valencia in 1238, Murcia in 1243, and Seville in 1248.

While Almohad rule collapsed both in the Maghreb and in al-Andalus, there were attempts at replacing it with local forms of government. This happened in al-Andalus according to a pattern that had been followed before during the collapse of Umayyad and Almoravid rules. Military men, urban elites, and charismatic leaders aimed at creating viable political and military entities in order to ensure the maintenance of the remaining territory under Andalusian rule. Only one such attempt succeeded, that founded by Ibn al-Ahmar in Granada and the surrounding area. From the middle of the thirteenth century until 1492, the Nasrid kingdom of Granada managed to survive by taking advantage of the internal dissensions both among the Christian kingdoms and those Muslim states that had been created in North Africa after the demise of the Almohad empire. The political unity achieved by Isabel of Castille and Fernando de Aragón signaled the end of the small Muslim kingdom of Granada. In the same year that Christopher Columbus disembarked in America and Jews were expelled from Spain, Granada was conquered and al-Andalus as a political entity ceased to exist. But the term survived in the form of Andalucía, the name given to the southern regions of Spain, this being the area where Muslim rule had lasted longest.

ARABIZATION, ISLAMICIZATION, AND THE RELIGIOUS MINORITIES OF AL-ANDALUS. The Muslim armies that conquered the Iberian Peninsula were formed mostly of Berbers, with small groups of Arabs. The number of the Arabs increased when a Syrian army sent by the Umayyad caliph in Damascus to suppress a Berber revolt in North Africa sought refuge in al-Andalus. The first Umayyad ruler, ʿAbd al-Raḥmān I, attracted other members of his family to his capital. The number of Arabs also increased by intermarriage with the local population, as their descendants became Arabs due to their strict patrilineal genealogical system, and also through the establishment of patronage ties with other ethnic groups. Arabic tribal affiliations (*nisbas*) became a distinguishing feature of the Andalusian population, in contrast to that of the Maghreb (Morocco), where Arab settlement was scarce. Arabic ethnicity and language were cultivated and praised by men of letters and poets, and also by historians, both under Umayyad rule and during the eleventh century, when the legitimization of some of the Taifa kings, such as

the Abbasids of Seville, was grounded on their Arab ancestry.

It is difficult to establish for how long the Berber conquerors and first settlers of al-Andalus managed to preserve their own language, which has left very few traces. When ʿAbd al-Raḥmān III proclaimed himself caliph in 929, one of his policies was the consolidation of an Andalusī identity which, while not suppressing the Arab component, stressed the Islamic unifying factor. This Andalusī identity was felt to be under threat when new groups of Berbers, maintaining their language and tribal organization, settled in al-Andalus and seized political power in the eleventh century. The possibility (that many saw as a danger) of a Berberization of al-Andalus increased when the Iberian Peninsula became part of the Berber Maghrebi empires of the Almoravids and the Almohads. The complex dynamics at play between Arab and Berber ethnicities through the history of al-Andalus still await a monographic study.

Muslim Arabs substituted the Visigoths as rulers over the local Hispano-Roman population, who were (even if only nominally) Christians and whose languages were Latin and Romance. They, together with the Jews, became “protected peoples” (*dhimmīs*), being allowed to preserve their religion and their community life, although always in a position of subordination to the Muslims. The Christians of al-Andalus are commonly referred to as Mozarabs, although this term (not found in the Arabic sources) should be limited to the Arabized Christians in order not to obscure the complex linguistic and cultural situation of the Christian communities living under Muslim rule.

The language, culture, and religion, often inextricably linked, of the new rulers had a deep attraction for those Christians who were more directly in contact with the Muslims. Latin culture was still predominant in the ninth century, but in the tenth century the Christians of al-Andalus started to translate their religious literature (the Psalms, the canons of the Visigothic church) into Arabic. The bishop Recemundo (also known as Rabiʿ ibn Zayd) took part in the translation into Arabic of Latin and Greek works (such as Orosius’s historical work, Dioscorides’s treatise, and the famous Cordovan Calendar) that was carried out during the Umayyad caliphate. This trend towards acculturation had been harshly fought in the previous century by two Cordovan Christians, Eulogius and Alvarus, who promoted the movement of the so-called voluntary martyrs. These were Christian men and women, some of them born from religiously mixed marriages, who voluntarily sought martyrdom by publicly insulting Islam in reaction to what was perceived as the increasing loss of their identity. The church hierarchy did not favor their movement, which eventually faded away.

The linguistic and cultural Arabization of the Christian population took place with different rhythms and characteristics according to location and social and economic status. The issue of Romance-Arabic bilingualism of the indigenous population of the Iberian Peninsula has been hotly debated

in spite of, or more precisely, because of the scarcity of available sources and the contradictory interpretations to which those sources have been subject. Even if demography was in principle favorable to the Romance language spoken by the local population, Romance monolingualism survived only among those sectors who were rural, poor, illiterate, and Christian. Bilingualism was characteristic of the urban settings, while Arabic was the dominant language among the literate groups of society. In the tenth century, Arabic became the predominant written language and in the eleventh and twelfth centuries, the predominant spoken language. Arabic monolingualism (with diglossia between written Arabic and the spoken dialects) became the norm from the thirteenth century onward. The experience of al-Andalus thus differed from that of Iran, where the local language survived the process of Islamicization. Also in contrast to Iran, there was no cultural *shuʿubiyya* in al-Andalus, that is, the glorification and preservation of the pre-Islamic culture as part of the struggle of the convert local populations to achieve equality with the new rulers.

In opposition to what happened with Latin and Romance language and culture, the Jews of al-Andalus were able to maintain Hebrew as their religious and literary language and it became pivotal in the defence of their cultural identity, while at the same time they carried out a deep absorption of Arabic language and culture. In this context, a golden age was made possible. As David Wasserstein (1997) has put it, almost all the greatest poets writing in Hebrew in the Middle Ages were Iberian (Judah ha-Levi, Ibn Gabirol, Samuel Ha-Nagid, Moses Ibn Ezra), and some of the most important works of Jewish thought are also the product of Iberian Jewry (the *Kuzari*, the *Guide for the Perplexed*).

With the general exception of the Jews, Arabization was closely linked to the process of conversion to Islam. An early majority of Muslims in the population of al-Andalus was achieved in the first half of the tenth century and from that time onward, Christians lost the demographic battle.

THE HEGEMONY OF MALIKISM AND ITS ALTERNATIVES. The main distinguishing feature of Andalusī Islam is its lack of the religious pluralism expressed by the co-existence of the four legal schools (Malikism, Ḥanafism, Shafiʿism, and Hanbalism) recognized within the Muslim Sunnī world from the tenth century onwards. While Malikism reigned supreme in al-Andalus, Ḥanafism seems to have been banned, while the attempts at introducing Shafiʿism and Traditionalist trends akin to Hanbalism failed. The main alternatives to Malikism were locally produced: the Cordovan Ibn Hazm’s Zahirism, a legal school generally considered too radical for Sunnism, and the Almohad program of religious revival and reform.

The early Muslim settlers of al-Andalus were soldiers. Their religious and legal needs were catered for by their leaders, acting as judges and directors of prayer. The legal doctrine associated with a Syrian jurist, al-Awzaʿi (d. 773), is generally considered to have been followed by those judges, until it was replaced by Medinan (from Medina, the town

in the Arabia Peninsula where the Prophet ruled and died) jurisprudence at the time when a new scholarly class was being formed. The emergence and consolidation of a scholarly milieu can be documented from the late eighth and early ninth century onwards. The first scholars (*‘ulamā*) came mostly from the army milieu, which they left in what seems to have been a process of professional diversification on the part of the ruling elites. Soon, local converts devoted themselves to learning as a means to social advancement. By traveling to the central lands of Islamdom for commerce, in search of knowledge, and to carry out the pilgrimage, Andalusis became aware of and integrated themselves into the Muslim world of scholarship.

Umayyad rule had lasting consequences in how this world was shaped in the Iberian Peninsula. As the tenth-century geographer al-Muqaddasi noted, among the early schools of law, the one associated with Abū Ḥanīfah (d. 767) and later known as Ḥanafism was rejected. The Abbasids, the dynasty that had put an end to Umayyad rule, had generally favored this legal trend that was also supported by the Aghlabids, their representatives in Ifrīqiyah, so that the Umayyads of al-Andalus could only view it with suspicion. Furthermore, Ḥanafism was associated with ‘Alī and the town of Kufa and some of its doctrines were considered to be pro-Shī‘ah. This again could only favor its rejection on the part of the Umayyads, whose rise to power had taken place by fighting against ‘Alī’s party. The other major legal trend in the eighth century was that associated with Medina and more specifically with Mālik ibn Anas (d. 796). It has been said that Andalusī scholars adopted the latter’s legal doctrine because their travels took them to Egypt and the Ḥijāz, where they studied with Mālik’s pupils. But if geography certainly had a role, it was associated with politics, as the first Andalusī scholars did not travel to Iraq, the center of Abbasid power. Also, some aspects of Medinan-Mālikī doctrine were seen as being congenial with Umayyad history and legitimacy.

An Andalusī scholar of Berber origin, Yahya ibn Yahya al-Laythi, had a crucial role in bringing together Mālik’s and his pupils’ doctrines and the Umayyads of al-Andalus. A revolt against al-Hakam I (r. 796–822) that took place in Cordova during the year 817 and in which Yahya ibn Yahya took part made it clear to the Umayyad emir that the emerging group of scholars could channel either popular opposition or support to the ruler and that without them Umayyad power could be put in jeopardy. For his part, Yahya ibn Yahya realized how advantageous the ruler’s support was in getting the upper hand for his own followers in the struggle among the emerging factions of scholars. A pattern of collaboration between the ruler and the scholars was established and Mālikī ‘ulama’ started serving the Umayyads as judges, legal experts and advisers, and in other legal charges. A rapidly growing body of legal literature began to be transmitted in al-Andalus and soon also to be authored by Andalusī scholars, such as ‘Abd al-Mālik ibn Habib (d. 852–853), al-‘Utbi (d. 868–869) and others.

By the tenth century, Andalusī jurists belonged, with few exceptions, to the Mālikī legal school. Andalusī Mālikīs were well integrated in chains of teachers and pupils, whose relationships, achievements, and social practices started to be recorded in biographical dictionaries. A number of legal treatises were used for the training of pupils. The proclamation of the Umayyad caliphate in 929 consolidated Malikism as an “official” legal school, making it a crucial element of the Andalusī identity promoted by both rulers and scholars, and thus separating al-Andalus from heterodox Fāṭimid North Africa and also marking it within the Sunnī world. The Umayyad caliphs of Cordova stressed the association of Malikism with Medina, the town where the Prophet had acted as ruler, thus implying that by following this legal school, Medina had been relocated in the Iberian Peninsula and that it was as if the Prophet himself was ruling again over the Muslims.

But even if al-Andalus was Mālikī and only Mālikī, this does not mean that it was monolithic. There were always discrepancies within the school, most of them deriving (or said to derive) from the various interpretations of Mālik’s teachings by his pupils and also from the latter’s own contributions to the body of legal doctrines and practices. The existence of such legal differences (*ikhtilaf*) was accepted, as it was the inevitable result of the human effort at understanding (*fiqh*) the revealed law (*sharī‘ah*), but it also led to polemics and sometimes to harsh attacks against those jurists with whom one disagreed, attacks which could even become accusations of religious deviation. One of the main areas of disagreement was how to carry out the process of traditionalizing the early body of Mālikī literature, which contained very little reference to Prophetic tradition (*ḥadīth*).

During the ninth century, “the conviction became absolute that law is justified only if it can be related hermeneutically to Prophetic exempla, and not if it is presented discursively as emanating from an ongoing juristic tradition” (Calder, pp. 18–19). The Eastern jurist al-Shāfi‘ī (d. 820) devoted himself to the science of the fundamentals of law (*usul*) and forcefully argued that law had to be derived from both Qur‘ān and *ḥadīth*, and that the methodology for such derivation had to be strictly regulated. At the same time, great effort was made in the central lands of Islamdom to make available compilations of *ḥadīth* to the jurists.

These tendencies would soon echo in al-Andalus. Andalusis started traveling to Iraq by the second half of the ninth century and brought back the doctrines of the Traditionalists. Some of those Andalusis won to Traditionalism were radicals, who rejected Malikism and tried to introduce Shafī‘ism. The Cordovan Baqī ibn Makhlad (d. 889), who wrote a voluminous compilation of *ḥadīth* (now lost), excelled among them. But his extremism provoked the legal establishment and he was accused of heterodoxy. The ruler, who saw the advantage of scholarly infighting, saved his life. Eventually, those Mālikīs who were receptive to the new trends managed to Traditionalize their legal doctrines with-

out becoming Shāfi'ī. This was a long process and its complete story still needs more study. The most prominent jurists along this road were Ibn Waddah (d. 900), al-Asili (d. 1002), Abū 'Umar ibn 'Abd al-Barr (d. 1071), Abu-l-Walid al-Bajī (d. 1081), Ibn Rushd al-Jadd (d. 1126), Abū Bakr ibn al-'Arabi (d. 1148), and al-Shatibi (d. 1399). In their writings dealing with *ḥadīth* literature, Qur'ān commentary, and legal methodology, they carried out the adaptation of Malikism to the new legal trends. Of crucial importance were the commentaries written by Ibn Rushd al-Jadd of the two founding texts of Western Malikism, Sahnun's *Mudawwana* and al-'Utbi's *Mustakbraja*, as his effort was directed at connecting the legal doctrine found in those two early texts with the Qur'ān, the Prophetic Tradition, the consensus and analogical reasoning (*qiyas*), the four legal sources established by al-Shāfi'ī. In other words, Ibn Rushd al-Jadd was able to insert early Mālikī legal opinion (*ra'y*) within the context of *usul* methodology, without much substantial change being introduced in traditional Andalusī Maliki practice.

The endeavor of these reforming Mālikī jurists from the time of Abū 'Umar ibn 'Abd al-Barr onwards was greatly influenced by the challenge posed by Ibn Hazm's doctrines to Andalusī Malikism. Ibn Hazm (d. 1064) left Malikism to become a Zāhirī, thus adhering to a very literal interpretation of the religious sources (Qur'ān and *ḥadīth*), limiting consensus to that of the companions of the Prophet and rejecting analogical reasoning. After abandoning an unsuccessful career in the dangerous waters of Taifa politics, Ibn Hazm dedicated his life to producing a complete alternative to the Mālikī legal system. According to Ibn Hazm, Mālikīs considered it wrong to act according to the contents of a *ḥadīth* if the practice of the community was contrary to it. He put all his considerable intellectual gifts to work to reverse that trend, making *ḥadīth* the basis for practice. Had he succeeded, it would have meant the disruption of the Andalusī scholarly milieu and a complete renovation of the urban elites, closely associated, as in any other Islamic region, to the world of scholarship. Ibn Hazm's aims probably included this social, and eventually political, disruption, in which he might have seen a solution for the problems he denounced in Andalusī society under the Taifa kings. But Ibn Hazm did not succeed in making al-Andalus adhere to his legal vision. Nevertheless, he left an enduring legacy. Mālikīs were forced to react to the formidable challenge represented by his writings and his doctrines, so that the most able of Mālikī scholars devoted their energies to refuting Ibn Hazm. And by doing so, Malikism was inevitably changed.

Part of Ibn Hazm's vision can be found in the religious and legal policies of the Almohads. Their struggle for radical reform was formulated as a return to the times of the prophet Muḥammad, whose teachings had been revived by their Messianic founder, the Mahdi Ibn Tumart. The latter's successor, the Almohad caliph, was to ensure correct interpretation of the religious sources and the disappearance of diversi-

ty of opinion through his acting as the vicar of God or caliph, and through the training of a body of scholars, the *talaba*, charged with the diffusion and control of Almohad theological and legal doctrines. In many ways, this version of Almohadism was closer to Shiism than to Sunnism, so that the proposal has been made to name this experiment of radical reform the "Sunnitization of Shiism" (Fierro, 1999, p. 232, note 23). It eventually failed, not only because of the political and military collapse of the Almohads, but also because Malikis soon reacted against those aspects of Almohadism that represented a departure from the Sunnī understanding that, as important as revelation is, the historical experience of the Muslim community has always to be taken into account. Those with totalitarian leanings who try to dismiss that historical experience put themselves in the margins of Sunnism.

RELIGIOUS DOCTRINES AND PRACTICES. Legal and law-related writings constitute the main body of the Muslim literature written and transmitted in al-Andalus. Islamic jurisprudence (*fiqh*) regulated the relations among men and also between man and God, and Andalusī scholars, like their colleagues in the rest of the Islamic world, devoutly engaged in the search of God's norms to humankind, an effort that at the same time allowed them gaining a livelihood as *qadis*, jurists, notaries, and teachers.

A special feature of this endeavor is the rich tradition of *fatawa* literature, where the legal opinions on a variety of issues formulated by Andalusī jurists were collected. As Hallaq has pointed out, whether in his capacity as a private legal expert or as an advisor to the court, the juriconsult determined the law. The *fatawa* literature thus represents a privileged vantage point from which to analyze the interplay between law, society, and religion. Studies devoted to it in the past decades have opened new and promising venues of research on many aspects of Andalusī social and religious practices. This literature gives information mostly on urban areas. The possibility of learning about what was going on in rural areas is limited, although archaeology (which has greatly developed in the last decades) has made them better known, while the incorporation of anthropological knowledge has also opened new perspectives, as in the case of the function of holy men and charismatic leaders among the Berbers.

Qur'anic and *ḥadīth* literature, as well as theology, have not been paid as much attention as law. Recent interest on the Almohad period might give more impulse to the study of theology, as correct belief became one of the fundamentals of Almohad religious policies (the population ruled by the Almohads was supposed to learn by heart the Almohad profession of faith). This trend was related to developments taking place in the rest of the Islamic world and in it the impact of the famous thinker and reformer al-Ghazālī (d. 1111) can be detected. The reception of al-Ghazālī's works and ideas in the Islamic West has been subject to many studies, mostly related to the issue of the spread of Sufism that took place in the twelfth century with figures such as Ibn al-'Arif, Ibn

Barrajan (both died in 1141) and Ibn Qasi (d. 1151), who did not limit himself to the study and teaching of Šūfī doctrines, but also engaged in a political career as a charismatic ruler in the troubled times that preceded the Almohad caliphate. The most famous Andalusi Šūfīs are Ibn Masarra (d. 931), better understood now thanks to the publication of his works that were thought to be lost by Asín Palacios in his often quoted monograph; Ibn Sabʿin (d. 1269); and especially Muhyi al-din Ibn al-ʿArabi (d. 1240). The latter, like many other Andalusi Šūfīs, spent much of his life outside al-Andalus. In fact, Šūfīs did not find in the Iberian Peninsula an atmosphere as congenial to their presence as that existing elsewhere, especially in the Maghreb, where Šūfīs and more generally holy men accomplished a variety of functions for which there were competing figures or arenas in al-Andalus. The twelfth century, especially in the Almohad period, witnessed not only the flourishing of Sufism, but also that of philosophy. The career and written production of Ibn Rushd (Averroës) is closely linked to the Almohads's religious and intellectual program. Although Averroës's philosophical work transcended that program, Averroës's most lasting influence is to be found not in Islamdom but in Christian Europe.

Andalusis were keen in portraying their religious history as an unbroken tradition of orthodoxy, without heretical sects, and on the few occasions in which they appeared they were soon annihilated. This image evokes historical developments that supported religious uniformity in al-Andalus, but it also reflects the powerful capacity of Andalusi scholars of assimilating the changes taking place in their milieu and therefore making them almost invisible.

MUSLIMS UNDER CHRISTIAN RULE. The religious experience of Muslims in the Iberian Peninsula also had a specific trait: that of the Mudéjares, the Muslims who had neither migrated nor converted when their lands were conquered by the Christians but who continued to live as Muslims under Christian rule. They were able to temporarily maintain the use of Arabic, while progressively acquiring the language of the conquerors. This bilingualism was short-lived in some areas, such as Castile, where Arabic was lost, while in the Kingdom of Valencia it lasted longer. A curious form of linguistic survival was to use Arabic letters to write Romance (the so-called *aljamiado* or *aljamia*), not because those who used *aljamiado* wanted to ignore the Romanic script but because they sought to keep themselves linked to the sacred language of the Qurʾān. The use of *aljamia* was a profession of faith, a sign that indicated the users' belonging to the Muslim community.

The status of the Mudéjares came progressively under threat after the conquest of the last Muslim kingdom. The Mudéjares of Granada and Castile were forced to convert to Christianity in 1501 and 1502, those of Valencia in 1521 and 1522, those of Aragon in 1524, in a process that by 1526 signaled the end of Islam as a permitted religion in the Iberian Peninsula. These forced converts are known as Moriscos.

Efforts for the Christianization of the Moriscos were carried out according to policies closely intertwined with contemporary debates about the conversion of the Indians of America. In spite of the inevitable, but slow, process of religious and cultural assimilation, the new Christians were suspect in their religion and often denounced as a potential fifth column for the Muslim enemies of the Spanish crown. Also, there was rejection on the part of some sectors of Christian society of their cultural difference. After their rebellion in Granada in 1568, the persecution of the Moriscos at the hands of the Inquisition increased and the remaining communities grew weaker. Their expulsion was discussed in 1582, the first decree was promulgated in 1609, and between 1610 and 1614 the Moriscos were forced to leave the Iberian Peninsula. With them, the small amount of Arabic that still survived disappeared as a spoken language. The dispersion of the Moriscos in Muslim lands and their eventual acculturation to the new context also meant the disappearance of the Andalusi dialectal bundle. For a while, they preserved the Romance language in the new lands where they settled, even producing works in Castilian in Tunis.

Surviving legal opinions dealing with the issue of whether Muslims were allowed to live under Christian rule, mostly formulated by jurists who did not live in the Iberian Peninsula, show a powerful tendency to reject this possibility, arguing that residence in a non-Muslim territory precluded following fundamental tenets of the Islamic religion and was thus equated with religious and cultural corruptions such as eating carrion, blood, or pork. This attitude must have been demoralizing for the religious elites of Mudéjares and crypto-Muslim Moriscos who did not emigrate (emigration to Muslim lands was economically difficult, if not impossible, for the more humble members of the community). Even so, they managed to develop varied and fruitful strategies for religious and cultural survival, the study of which has offered and is still offering new perspectives on the general issue of the interplay between normative and local Islam. *Aljamiado* literature preserved the fundamentals of religion and law, as well as Muslim sacred history, and made them available to the community at large. Sophisticated forgeries such as the Gospel of Saint Barnabas and the Lead Tablets of the Sacromonte of Granada tried to demolish the distinction between "old Christian" and "new Christian" as a rationale for the elimination of the Moriscos, in an attempt to ensure the physical permanence in the Iberian Peninsula of the descendants of its former Muslim inhabitants.

THE LEGACY OF AL-ANDALUS. As in other Islamic societies, in al-Andalus Muslim rulers allowed the existence of Christian and Jewish communities as *dhimmis*, although there were episodes of persecution under certain political and religious circumstances, such as the pogrom of Granada in 1066, the expulsion of the Christians to North Africa in 1126, and the forced conversion of the Jews under the Almohads. Eventually, both non-Muslim communities either disappeared from al-Andalus or saw their numbers greatly di-

minished, although their Arabo-Islamic acculturation had lasting consequences.

But before exploring them, what was their contribution to Andalusí cultural and intellectual achievements? Echoes of the Latin tradition in astrology, medicine, geography, history, and perhaps agronomy have been identified in early Andalusí culture. The most famous example is the Cordovan Calendar. But there was nothing comparable to the impact of Hellenistic culture in the Eastern Islamic civilization and thus Sa'íd of Toledo, writing in the eleventh century, stated that the scientific development of al-Andalus was not indebted to any indigenous tradition. The related issues of the possible influence of Romance lyrics in the appearance of new poetical forms (*muwashshat* and *azjal*) in al-Andalus and of the possible influence of such forms in Western poetry have been (and still are) widely and ardently debated. The *muwashshat* encapsulate verses in Romance called *kharjas*. They have attracted a passionate interest from Arabists, Hebraists, and Romanists, giving rise to hugely divergent interpretations and becoming one of the cornerstones of the presentation of al-Andalus as the land of the three cultures or the land of religious *convivencia* (living together). This largely mythical presentation has had a recent flourishing, owing once again more to contemporary needs than to historical accuracy.

Less open to debate is the impact that Andalusí Christians and Jews had in Latin Christendom and in Jewish culture. In the case of the Christians, those who emigrated to Christian lands brought with them artistic skills that modern scholarship has analyzed as representing a specific Mozarabic art, unique to the Iberian Peninsula. The Christians who lived in Muslim lands conquered by the northern Christians kept for some time the use of Arabic, as shown by the rich collection of Arabic documents from Christian Toledo (eleventh to thirteenth centuries), and they also preserved the old Visigothic church ritual.

But it was mostly the highly Arabicized Jews who played a crucial role in the transmission of Arabic culture and science to Christian Spain and Europe. They are closely associated with the so-called school of translators of Toledo, a label which is merely a way to express in a simple manner the complex linguistic and intellectual process through which Arabic works were translated into other peninsular languages (Latin, Romance languages, Hebrew). The need to translate arose mainly for two reasons.

On the one hand, knowledge of the "other" was necessary in order better to confront the Muslims or to convert them, especially when Christian expansion led to the presence of Muslim communities inside Christian territory. In the twelfth century, Latin Christendom started the serious study of Islam, thanks mainly to the encouragement given by Peter the Venerable of Cluny to the translation of Muslim religious texts. Raymond Lull (1232–1316), who called himself Christianus Arabicus, developed a philosophical-apologetical system with the aim of convincing the infidel

Muslims of the truth of the Catholic faith, arguing not against, but rather from their own faith, which he had deeply studied. On the other hand, translation was needed to take possession of the knowledge achieved by the Muslims in philosophy, science, and other fields. For example, Christian historical works written in the thirteenth century, like those produced under the patronage of Alfonso X the Wise, were highly indebted to Arabic chronicles, in the same way that the Arab geographers had learned about the Iberian Peninsula from Latin sources. But the translation effort concentrated mostly on the field of the "sciences of the ancients."

The Greek and Latin legacy was sought where it was known to have been preserved, in those Arabic works containing translations from that legacy, but also the original contributions made by Muslims themselves. In fact, in searching for the scientific and technical knowledge of antiquity, the Christians had to acknowledge the importance of the additions made in the Arabo-Islamic civilization. That search started early, as shown by the manuscripts of Ripoll monastery (in Catalonia). The main impulse took place in the twelfth century, when Hermann of Carinthia and Robert of Ketton worked in the Ebro valley, while Dominicus Gundisalvus and Gerard of Cremona centered their activities in Toledo. The exact sciences, linked to astrology and magic, attracted the first translating efforts, but philosophical and medical treatises were soon incorporated. Andalusí Aristotelianism had a lasting influence in Latin and Hebrew philosophy.

Averroës's works were already translated in the first half of the thirteenth century, shortly after having been written, provoking the well-known reaction of both attraction and rejection in Christian Europe. Alfonso X the Wise promoted the translation from Arabic into the vernacular, employing mostly Jews, of a wide range of works dealing with magic, astrology, astronomy, games, and literature. Arabic vocabulary penetrated into these vernacular languages, mainly in the fields of agricultural products and techniques, building crafts, clothing, and food. Mudéjar art, like its counterpart Mozarabic art, singles out Spain from the rest of western Europe with the exception of Sicily. Spanish medieval literature is indebted in both contents and form to Arabic literature. The Muslim religious influence on peninsular Judaism has acknowledged manifestations in the fields of mysticism and theology, while its influence on Christianity is less widely accepted. This reflects the tensions that have existed (and continue to exist) in the construction of a Spanish Catholic national identity, while similar debates (such as that on the debt of Dante's *Divine Comedy* to Muslim eschatology) show that the study of religious interaction has been, and still is, a contested field.

The al-Andalus cultural and intellectual legacy should not be sought only in what is now known as the West. Andalusí Islam produced works and developed doctrines and practices that had a lasting influence in the Muslim world at large. Following Christian expansion in Muslim lands,

Andalusi intellectual elites started a process of emigration to other regions of Islamdom. Its rhythm and peculiarities are not yet well known, but it helped disseminate Andalusi cultural achievements among Muslims. Any look at the contents of extant Muslim libraries reveals that the list of Andalusi “best-sellers” in Muslim religious literature is substantial and that in certain areas, such as North and Central Africa, Islam cannot be understood without reference to the thought and works of Andalusi scholars.

MARIBEL FIERRO (2005)

ISLAM: ISLAM IN SUB-SAHARAN AFRICA

Islam entered Africa within decades of its inception in the seventh century CE. In North Africa its spread was related to the empire-building process which took Islam to Morocco and Spain in the far west and to India in the east whereas in the rest of Africa its diffusion followed a different path. The African dimension goes back to 615 CE when the first Islamic migration to Abyssinia, now called Ethiopia, took place, though its impact there at this early stage is not clear. A few years later, the epoch-making *hijrah*, or migration, by Muḥammad and his persecuted band of followers to Medina created the political center of the nascent Islamic state built in Arabia. The task of spreading Islam beyond the Arabian

peninsula to other regions, including North Africa to the fringes of the Sahara, was left to Muḥammad's successors or caliphs.

Scholars, until recently, have not paid sufficient attention to the Islamic intellectual tradition and culture in sub-Saharan Africa which is generally treated as a periphery of the Islamic heartland in the Middle East. Moreover, studies about Islam in Africa are often marred by the view that gained currency during the colonial era, namely that African Islam represented a syncretic or diluted version of the faith, stripped of elements of its higher tradition. This view is difficult to understand given that Islam is indeed a religion of great synthesis which (in the areas where it has spread) has interacted with local cultures, enriching them and being enriched by them. The study of Islam in sub-Saharan Africa is now entering into a new and very interesting phase (for instance, witness local and international efforts to help save old manuscripts relating to Tombouctou's intellectual heritage) as scholars begin to look at Africa's literary tradition and contributions to aspects of Islamic law, mysticism, devotional matters, theology, and history in Arabic or local languages. The number of Qur'anic translations in African languages, using the Arabic or Latin alphabet, moreover, has also been growing steadily and testifies to this increased urgency to produce written material for African Muslims.

Knowledge of the history of Islam in sub-Saharan Africa before the sixteenth century comes mainly from the works of Arab geographers and historians such as al-Bakr, al-Zuhri, Ibn Batuta, and others. Archaeological excavations of important centers of trade, such as Kumbi Saleh, Awdaghust, Jenne, Kilwa, and others, have added further to the knowledge of these cities by allowing for historical reconstruction. Finally, oral traditions have become an increasingly important source for the study of this history as they present information (in legendary form) of kings such as Sundiata, the founder of Mali, which can be critically assessed to provide insights into what is remembered and emphasized about the past. The sources of information become more varied after the sixteenth century and include written material in Arabic by local Muslims, oral traditions and ethnographic data, and European records in the era of European expansion and domination of the Atlantic system.

ISLAM IN THE SAHARA AND THE SAHEL. Islam made its presence felt in much of Africa (the east coast and Horn of Africa as well as West Africa) mainly through trade and migration. In the Sahara region and beyond it, for instance, Islam was introduced from North Africa by the Berbers, mostly members of Khārijī sects, through the trans-Saharan trade as early as the eighth or ninth century. They had their centers in the oases at the northern side of the Sahara in Sijilmasah, Tahart, Wargla, and Ghadames. With the expansion of this mainly salt-for-gold trade, important trading towns such as Awdaghust, Tadmeka, and Kawwar also sprang up at the southern end of the Sahara. Beyond them lay the important African states of Ghana (with Kumbi Saleh as its capital), Gao,

and Kanem in the region that was known as the Sahel (which means in Arabic the “shore” of the desert). This was the region where the desert and the savanna meet and where Sahelian cities served as terminus points for a very vibrant international trade.

The Khārijī influence in North Africa had declined by the tenth and eleventh centuries due to a number of factors, including the Shī‘ī Fāṭimid conquest of North Africa, the destabilizing migration of the Arab Hilalian nomads, and the rise of the Almoravid movement among the Sanhaja Berbers of southwestern Sahara and the Mauritanian coast. The latter factor was especially important in entrenching the Sunnī Mālikī school of law in the region against both the Ḥanafī (supported by the Aghlabids) and the Shī‘ī Fāṭimids. Mālikī scholars had arrived in North Africa as early as the ninth century and had successfully won the support of both the pastoralists and traders among the Berbers who became the vehicle for dissemination of Islam into the Sahara and beyond it in West Africa.

The increasing interest in the wider Arab/Muslim world in the source of gold for the trans-Saharan trade led to Ghana receiving mention in Arabic writings as early as the eighth century. Nevertheless, it was only after Muslim traders from North Africa began to settle in the largest Sahelian states by the eleventh century that more detailed descriptions of these states appear. For instance, the Arab geographer in Islamic Spain, al-Bakr, described Ghana’s capital, Kumbi Saleh, as constituting two separate towns situated at a short distance from each other. One was a distinctly Muslim town, set aside for Muslim merchants who had their own mosques, and the other, the royal town, consisted of a palace and conical huts where the imperial indigenous form of religion was practiced. The king, who was known to be a man of justice and extended his friendship to the Muslims, appointed many of them, as the literati in society, to ministerial positions. Similarly, Gao, on the Niger, east of the river bend, was also divided into Muslim and royal towns although the king in this case was a Muslim. It was only in Takrur, on the lower Senegal River, that the Muslim king was reported as carrying out a vigorous campaign of conversion among his subjects and neighbors.

By about 1050 CE the kingdom of Ghana had expanded to include the Berber town of Awdaghust. A few decades later the king and the people of Ghana, according to al-Zuhuri who wrote in the twelfth century, had converted to Islam under the influence of the Almoravids (al-Murabitun). Some scholars have read the early sources as suggesting that this conversion was not attained by peaceful means. Recent careful study, however, has raised doubts about this conquest hypothesis which is considered to be more fiction than fact. In any case, Ghana continued to thrive as a state until the thirteenth century when its decline began due to a combination of factors, including Bure gold fields opening up farther south in the savanna country, new trans-Saharan routes developing farther east of Awdaghust, over-exhaustion of re-

sources in this marginal Sahelian zone for food and iron production, and the continuous pressure from Berber pastoralists in search of new pastures for their stocks. Mali by then had emerged as the dominant power in the region.

MALI: THE WEST-AFRICAN PATTERN OF ISLAMIZATION.

From an early period, political developments in West Africa were continually shaped by the trading network which depended on the trans-Saharan routes being extended to new sources of gold to the south. These trading networks developed among local African groups, mostly of Soninke origin (related to the rulers of Ghana), such as the Mande (Wangara/Dyula) whose area of operation was over a wide area, extending from as far west as Senegal to northern Nigeria in the east. This trade network, which led to exposure to Islam as a result of trading transactions with North Africans, was closely associated with the diffusion of Islamic studies, including mysticism in the later centuries, and enabled Islam to penetrate peacefully beyond the Sahel into the savanna area. Initially Islam was the religion of the African traders, then the rulers (who sought Muslim prayers if those of local priests failed), and finally (due to the efforts of Muslim scholars in later centuries) commoners among various African communities.

The cross-cultural trade in many parts of Africa, apart from reinforcing cultural self-identity and nurturing religious commitment, fostered a pluralist structure in which commerce, Islam, and the indigenous system supported the urban network. In this way a balance was established between local ritual prescriptions and those of universal Islam.

Islam in Africa was (as in many parts of the world where it reached) primarily an urban religion (with an urban ethos) which fostered commitment to its religious system, ranging from ethnic self-identity to Islamic self-identity, universal and trans-ethnic in scope. Islamic penetration in the rural areas, on the other hand, made slow infiltration over a long period of time with significant gains awaiting a much later period. The religion therefore entered much of Africa peacefully through the agency of trade and later gained status after the migrant community (purveyors of the written word and the visual symbols of Islam) became integrated into the political structure. Finally the ruling elite embraced the faith and appropriated its symbols for political purposes.

The level of commitment to Islam varied from one region of Africa to another and was influenced by a number of factors, including the length of interaction between Islam and the traditional religion, societal organization between centralized and non-centralized or “stateless” ones (in West Africa evidence suggests that Islam was not often adopted by segmentary societies), the compatibility or incompatibility of the world views of the two religious systems, and the level of resilience of the indigenous integrative symbols to sustain traditional structures of the local religion. Islam is based on a written scripture, prescribed ritual, a historical and historicizing tradition, and a supra-ethnic religious identity. Its interaction with traditional African religions is therefore gov-

erned by the tension between the supra-ethnic universality of its *ummah* and the ethnocentrism of traditional African religion. As one scholar has put it, for the African, the ethnic group is the matrix in which his or her religion takes shape, the meaning of myth communicated, and a person's sacramental relation to nature experienced. This means that when the traditional symbols of an ethnic group are challenged by a new system, recombination of old and new forms may appear to reorganize the group and to compensate for any loss. More specifically, becoming a Muslim and joining this universal *ummah* involves offering prayers in a mosque frequented by members of other ethnic groups, adoption of Muslim behavior patterns and dress code in some cases, and using a certain language (e.g., in the case of East Africa, Kiswahili). The Kano Chronicle, a written version of the oral traditions not committed to writing until the nineteenth century, brings out clearly the struggle between the two religious systems, the Islamic and the traditional one, after the symbolic tree is cut down and a mosque built in its place.

In the case of Mali, despite the influence of Islam among the Malinke chiefs prior to the founding of the empire by Sundiata, the latter is presented in the Arabic sources and oral traditions as a great hunter and a magician who mobilized the resources of his people against the Sosso in the name of the ancestral tradition, not Islam. Yet, when Mali expanded and was transformed from a small chiefdom to a sprawling multi-ethnic empire extending into the Sahel region, its Muslim rulers (including the famous Mansa Musa with his lavish pilgrimage to Mecca) shifted their attachment over time from traditional religious references to a more universal Islamic outlook.

Mali reached the height of its power in the fourteenth century during the reign of Mansa Musa (1312–1337) and Mansa Sulayman (1341–1360) when the specifically Muslim character came to be reflected by the many mosques and centers of Islamic learning, such as Tombouctou. Ibn Batuta visited Niani, the capital of Mali in 1352/3 and reported attending an official Islamic festival which attracted the presence of the king as well non-Muslims. He spoke highly of the people's efforts to study the Qur'an from memory, their hospitality, and their love of justice, though he deprecated their pre-Islamic customs which he still found to be in vogue.

By the end of the fourteenth century and certainly the beginning of the fifteenth century, the Mali empire was in decline with a series of weak rulers, dynastic struggles, and loss of control to the Tuareg and later to Songhai over the Sahel (the region where Islam had been more firmly established). The outer provinces (such as the Mossi areas to the south of the Niger bend) broke away and went their separate way, with the Mali state contracting to its original borders on the upper Niger.

SCHOLARS AND RULERS: TOMBOUCTOU IN SONGHAÏ. While traders played a major role in the dissemination of Islam across the various trading networks in the region, the work

of entrenching and deepening peoples understanding and commitment to the faith was left to the religious scholars (*'ulamā'*). The term *'ulamā'* covers a range of Muslim religious personalities, from the learned elite of the Muslim world who is steeped in one or more of the Islamic sciences—including Qur'anic exegesis, Islamic jurisprudence, and so on—to the teacher/preacher/healer/holy man who provides services of a magical-religious nature to both Muslims and non-Muslims. The latter played similar religious, social, and political roles as did the African priest/healer/diviner whose traditional shrines served the same type of function as did the mosque, God's house, or sanctuary. These Muslim healers maintained a level of neutrality in the political affairs of the places where they resided. This served to enhance their powers as they were not perceived to be a threat to the local political elite.

Muslim scholars provided their services at the centers of political power, in chiefly and kingly courts as well as at major trading and learning centers, such as Tombouctou which provided an important link between the Sudanic savanna and the Berber Sahara. The city produced its own indigenous scholars, some of whom, under the rule of Mansa, were sent to Fez in Morocco to further their studies. In the fifteenth century, the Sanhaja scholars (under the patronage of another Berber group, the Tuareg, who were their kin) became prominent in Tombouctou. They gained the title of the people of Sankore, owing to their residence in the quarter of the Sankore mosque.

Unlike their counterparts in West Africa, the Sanhaja scholars of Tombouctou did not shy away from the political message of Islam. They articulated the concerns of the merchants of Tombouctou about guarding the autonomy of the city which was conquered by Sonni Ali in 1469 thus setting off a bitter conflict. By then the kingdom of Gao had blossomed to become the empire of Songhai under the ruthless leadership of Sonni Ali, who persecuted scholars who opposed him, a fact noted in Arabic sources, while respecting those who collaborated with him. This is an early example of confrontation between religious scholars and a ruler of a West African kingdom.

After Sonni Ali's death in 1492, his son was soon ousted by Askiya Muḥammad Ture (1493–1528), one of the generals who had formed an alliance with discontented elements in the western provinces of Songhai. Ture, founder of the Askiya dynasty, strengthened the administration of the empire and consolidated the earlier conquests of Sonni Ali. He used Islam effectively to reinforce his authority, by involving the Tombouctou scholars in his pro-Islam policy, and to unite the various regions of his kingdom. His pilgrimage to Mecca a few years later brought him to the attention of the Muslim world as one concerned about the affairs of Islam. He returned with the title of *amir al-mu'minin* (commander of the faithful), conferred upon him in Cairo, which made him the politico-religious head of the Muslim community (*ummah*) in western Sudan.

Askiya Muḥammad's politics of appeasing potential opponents helped integrate even the Tuareg of the Sahara into the empire, a development that safeguarded the commercial interests of Tombouctou. For their part, the scholars of Tombouctou favored piecemeal changes in the Songhai empire and did not call for radical transformations of the type advocated by al-Maghili, a visiting scholar from the oasis of Tuat in the northern Sahara. Al-Maghili's responses to Askiya Muḥammad's questions represent the most sustained criticism of the religious and political situation in West Africa prior to the Islamic revolutions of the eighteenth and nineteenth centuries.

Among Askiya Muḥammad's great achievements was his revival of Tombouctou as a great center of Islamic learning. During this period the Mālikī scholars from Tombouctou visited Cairo, a major source of Islamic intellectual influence in the region, on their way to and from Mecca. In Cairo they studied mainly under eminent Shāfi'ī scholars from whom they assimilated the science of *ḥadīth* (the prophetic traditions), *taṣawwuf* ("mysticism"), and *balāghah* (rhetoric). In this way, scholarship in Tombouctou was broadened beyond the narrow parochialism of the Mālikī school that seems to have stifled intellectual life in the Maghreb at that time. One representative of this scholarly tradition was the famous Tombouctou scholar Ahmad Baba, who, along with the other leading scholars in the city, were exiled to Morocco following the invasion of Tombouctou in 1591. His excellence in Islamic erudition was acknowledged when scholars from the major towns of Morocco came to hear his lectures in Marrakech.

The Moroccan conquest transformed the autonomous town governed by its own patriciate of scholar families into the seat of an authoritarian military government. The outcome was that once again, as during the time of Sonni Ali, scholars led the resistance. The continued intellectual prominence of Tombouctou was confirmed by the two most important Arabic chronicles of West Africa, *Ta'rikh al-Sudan* (History of Sudan) and *Ta'rikh al-Fattash* (The researcher's history [of Takrur]), both of which were written there in the middle of the seventeenth century. They form part of the local Arabic historiography which documents, among other things, the rise and gradual decline of Tombouctou.

Tombouctou, which once had the status of a major center of learning and commerce, declined slowly, under the contested rule of the descendants of the Moroccan conquerors. Feuding factions struggled for power within Tombouctou and Tuareg nomads pressed the town from the outside. Arma (Moroccan) rule finally collapsed in 1737 when the Tuareg seized the town and became the dominant power on the Niger bend. Once commerce was affected, it did not take long for the decline in Islamic scholarship to set in. With military and political ascendancy passing into the hands of the Tuareg, learning and also spiritual leadership migrated to the nomads' camp. By the middle of the eighteenth century, the Kunta, a nomadic clan of Arab and Berber descent, exercised influence over the whole of Muslim West Africa.

The mediating and integrating functions of Islamic learning in the segmentary societies of the Saharan nomads was expressed through the influence of the marabouts who attempted to establish harmony between warring groups. These maraboutic lineages were also involved in trade, employing a network of disciples and followers. The transformation or conversion of religious prestige to economic resources and political assets accounts for the rise of the Kunta as a dominant scholarly and commercial network. Their leader, Sidi al-Mukhtar al-Kabir (1728–1811), a reputable scholar and a great mystic, reinvigorated the Qādirīyah Sūfī order, which until then had not played a particularly distinctive role in the religious life of the Sahara for more than two centuries. He was highly revered by the Tuareg and through his influence over them extended his patronage over Tombouctou. Through his disciples he facilitated the diffusion of his Qadiri teachings among many Muslim groups in the savanna.

ISLAM IN THE SAVANNA. The collapse of the imperial system in western Sudan, which had been sustained by the successive powerful states of Mali and Songhai, weakened the position of Islam in the savanna. There were now no longer patrons of learning like the great kings Mansa Musa and Askiya Muḥammad, with their strong commitment to Islam and its promotion in their respective states. Moreover, by the seventeenth century, Muslims were living under the auspices or authority of lesser chiefs who were strongly influenced by their traditional heritage. Yet, all was not lost, as Muslim traders were venturing farther afield, to the fringes of the forest, opening new areas to the influence of Islam. This allowed Islam (the religion of urban centers, generally followed by merchants, scholars, and the like in the age of the great empires) to filter into the countryside by the seventeenth and eighteenth centuries.

The Bambara of middle Niger, who had previously resisted Islamization during the period of the Mali empire, became more open to Islam when they entered a process of state formation of their own. The Scottish explorer Mungo Park reported in 1796 seeing many mosques in the Bambara capital. Bambara chiefs began to practice Islam while retaining traditional rituals. The Islam practiced by their chiefs accommodated local ritual practices, a pattern that recurs throughout the regions where Islam spread in Africa and Asia.

The role of Muslims as advisers to rulers and as specialists with access to supernatural power was transmitted from the middle Niger (central parts of modern Mali) to the Volta basin, where several patterns of Islamization and integration had developed. In Gonja, Dagomba, Mamprusi, and Wa (present-day northern Ghana), Muslims of Dyula and Hausa origin had assimilated many aspects of the local cultures in addition to adopting local languages. Moreover, Muslims had become integrated into the sociopolitical system of these states. In the area west of the Black Volta River (modern Ivory Coast), the Dyula managed to maintain their cultural

and linguistic identity either as residents of states, such as Buna and Gyaman, or as independent communities among stateless peoples. The exception was in Kong and Bobo-Dioulasso (formerly Upper Volta, now Burkina Faso) where the Dyula forged their own states.

Farther west, in the shared border area of Ivory Coast, Guinea, and Mali, the Dyula lived among Mande warriors and peasants, from whom they differed only in their commercial activities and Islamic faith. They were two contrasting groups, one of warriors (Mande) and the other of Muslims (Dyula). This dichotomy between warriors and Muslims held true over a large area of western Sudan and the Sahara. Thus warriors who exercised political authority, shed blood, and indulged in imbibing alcohol (which played the symbolic role of differentiating the two communities) often professed Islam but were not committed Muslims.

THE EARLY JIHAD MOVEMENTS. The *jihād* movements of West Africa represented a phase in the diffusion (often through the agency of Šūfī orders) and further entrenchment of Islam in the region. Part of the process of conveying Islam from the urban areas to the countryside and from the elite to the common people, *jihād* movements had the literary consequences of stimulating, in some cases, the production of Islamic material in Arabic or in the indigenous languages. It was partly a response to mounting levels of violence, abuse of political power, and the enslavement of people (including Muslims) in the age of the transatlantic slave trade.

With the rise of militancy in the 1670s, a crisis came about which pitted activist scholars against the traditional political elite. Nāšir al-Dīn, a Berber scholar from the southwestern part of present day Mauritania where the Almoravid movement had originated, challenged the political supremacy of the nomadic Arab Hassani warriors. He was an ascetic scholar known for his religious charisma (*barakah*). He called for repentance and mobilized his devoted disciples for a jihad in 1675.

In West Africa, the *jihāds* succeeded in bringing about the political ascendancy of Islam not through conquest or expansion from the outside, but through the uprising of Muslim militants who lived within pluralistic societies including non-believers as well as men and women of varying degrees of commitment to Islam. West African *jihāds* can therefore be considered religious uprisings that accomplished a long evolutionary process.

While the military efforts of Nāšir al-Dīn failed, his example most likely inspired the revolutionary movements which seized power in the following areas: Bundu, in present-day Senegal (c. 1700); Futa Jalon, in present-day Guinea (c. 1725); and Futa Toro (c. 1776). The scholars who led these movements, like Nāšir al-Dīn before them, adopted the title of *al-imām* which implied political and religious leadership. They were Torodbe, members of scholarly lineages in Futa Toro.

Of the post-*jihād* states, the one in Futa Jalon was the least stable as it was plagued by internal conflicts and the lack

of political integration of non-Fulani groups in the state. The one in Futa Toro did not fare any better as the leader, the *almamy imām* 'Abd al-Qadir, and his successors were unable to establish effective central authority.

KANEM-BORNU AND HAUSALAND TO 1800. Kanem, in present-day Chad, northeast of Lake Chad, was one of the earliest states mentioned in Arabic sources, with references to the area in Arabic texts dating to the middle of the ninth century. But Islam was introduced into Kanem by Muslim traders from Tripoli and Fezzan (in present-day Libya) only at the beginning the twelfth century, at least a century after it had gained a foothold in Takrur and Gao.

Unlike the situation in western Sudan where the spread of Islam was facilitated by the trans-Saharan trade which linked the network of trading routes to the gold fields, in central Sudan the trade in captives with North Africa in exchange for goods, such as horses, dominated the economy and inhibited the spread of Islam. There was no comparable trading and scholarly diaspora across an expanding network of routes; instead, there was a Sahelian state which, even at the height of its military power, expanded, not southward into the savanna, but northward into the Sahara, eventually reaching the Fezzan. These contacts across the desert though led to the growth of Islam among the Kanuri-speakers. Islam, however, did not enter Baghirmi, the first Islamized state south of Lake Chad, until as late as the sixteenth century.

The above notwithstanding, the fact remains that the influence of Islam in Kanem was far more sustained than in western Sudan as judged by developments such as the state's expansion of its northern borders to as far as the southern part of modern Libya in the thirteenth century, Kanem kings underscoring the importance of Islam by performing pilgrimage, and the establishment of an Islamic school in Cairo for Kanem students and scholars. Sometime in the fourteenth century, the Saifawa dynasty, in order to stave off a complete disintegration of the state, located in a very precarious and fragile environment, moved its capital to the grassland region of Bornu in the southwestern corner of Lake Chad (present-day Nigeria). Bornu, formerly a tributary state of Kanem, had access to a wider trading network. This led the Saifawa dynasty in the fifteenth century to establish trading links with the Hausa which enabled them to exchange salt and horses for Akan gold, ushering in a period of prosperity.

The Kanem-Bornu state reached its peak under the rule of mai Idris Alawma (1570–1603), when government officials were Muslim and the capital, N'Gazargamu, emerged as an important center of Islamic learning. Muslim scholars were highly respected, exempt from taxes, and looked to for advice. Other scholars who wished to maintain their independence and keep their distance from political authorities created their own Muslim communities in the countryside. It was in this state, which became the most Islamized of all African states prior to the Islamic revolution in Hausaland, that Islam filtered more widely to the common people. Yet,

even here, African ancestral elements remained at the symbolic and organizational levels.

Islam reached Hausaland during the fourteenth century when the Mali empire flourished and when the Saifawa dynasty relocated its capital to Bornu. This was the period when the Wangara trading diaspora was established on the eastern fringes of the Mali empire in Hausaland at the same time that a direct trade route from Hausaland to Tripoli was developed. These Wangara traders and the scholars who accompanied them provided services to Hausa rulers as they had done elsewhere in West Africa. Despite the employment of Wangara scholars at the courts, however, pre-Islamic beliefs continued to exist. Clearly, a struggle between the two religious systems existed as indicated by the Kano Chronicle.

By the end of the fifteenth century, King Rumfa of Kano attempted to make some reforms by ordering the symbolic tree to be cut down and a mosque built in its place. It is believed that the king, under the influence of al-Maghili, who visited Kano in 1493, installed Muslim judges and encouraged the construction of mosques. Moreover, Tombouctou scholars on their way to the pilgrimage visited Kano and neighboring Katsina to the north where they taught briefly. The outcome was the development or nurturing of a body of Hausa scholars in the region.

Some of the Muslim scholars who served at the courts of the Hausa rulers were later to become the object of criticism by later reformers. The former were seen as worldly scholars who had compromised Islamic teachings by their association with political authorities.

REVOLUTION AND REFORM IN HAUSALAND. The practice of living in separate communities (*jama'at*) with their followers in the countryside had already begun to develop among some pious-minded scholars who avoided both the kingly courts and the trading centers. Instead, they lived and preached among the peasants in the rural areas and contributed to the radicalization of attitudes. Some scholars became champions of the peasants and couched their grievances in Islamic idiom or language. The increasing production of devotional literature in Hausa by the eighteenth century contributed further to an Islamic awareness among the people.

Revivalist or reformist ideas gained momentum in different parts of the Muslim world in the eighteenth century and fed into *mahdī* expectations and millenarian excitement which, widespread in the Muslim world, dated back to the fifteenth century. Since the thirteenth century, Ṣūfī orders had developed ecstatic practices and antinomian tendencies, but in the eighteenth century, they shifted their orientation toward greater adherence to the *sharī'ah*. Mysticism of the speculative kind, with its focus on otherworldliness, was increasingly being supplanted by the strands which emphasized involvement in societal affairs and even political activism. While Muḥammad Abdul Wahhab's struggles against syncretism in Saudi Arabia went as far as rejecting the whole mystical tradition, the reform movements of West Africa sought reform within the Ṣūfī traditions of the area.

Several reasons have been suggested for this militancy. First, there was the religious excitement, particularly at al-Azhar, which influenced various parts of the Muslim world. In western Sudan this was expressed either through a radical Qadiriya, or as was the case later, through a radical Tijaniya. Second, Islamic messianism or millenarian expectations, which were quite widespread in West Africa, explains this tendency to radicalism. In particular the ideas of the eighteenth-century Egyptian scholar al-Suyuti had gained currency. Suyuti predicted that a *mahdī* would appear at the end of the eighteenth century. Even earlier than this was al-Maghili who presented in a radical way the doctrine of a rejuvenator or renewer of Islam (*mujaddid*). These seminal ideas took root and may partly explain the religious-political eruptions of the later centuries. Membership in Ṣūfī orders by these leaders, with special powers being attributed to them, increased the prestige and influence on their followers. Third, the institution of pilgrimage played an important role in preparing the careers of certain leaders for an active political life. Apart from legitimizing their role, the institution of pilgrimage was important in launching the career of certain leaders on a reformist course. The Tijani order became the moving force behind several later revolutions of the nineteenth century. Fourth, there was a growing Islamic consciousness on the part of the more learned Muslim scholars; this awareness went hand in hand with a call for radical reform. These were the *sharī'ah*-minded scholars who aimed at forging Islamic states. They articulated some of the local political and socioeconomic grievances but in the language or idiom of Islamic reform. They championed what has been called the "radical tradition" which Thomas Hodgkin defined as follows:

A tradition which emphasizes the rights of common people against their rulers, takes an egalitarian attitude to social differences, is concerned with changing institutions as a precondition of changing human beings, demands the widest possible diffusion of knowledge and education, stresses the idea of an international community, the need for puritanism in personal life and the urgency of social change—justifying in some circumstances the use of revolutionary methods to achieve it. ("The Radical Tradition in Muslim West Africa," in *Essays on Islamic Civilization*, edited by D. P. Little, 1976, p. 103)

Shehu Usuman dan Fodio (Uthman Dan Fodio), a Fulani religious leader, belonged to the autonomous scholarly communities of Torodbe/Toronkawa who kept their distance and avoided making any accommodations with the Hausa elite of Gobir. They were neither traders nor pastoralists although they shared cultural values with the Fulani pastoralists who, like them, carried arms and also excelled in horse riding.

Usuman, the charismatic and missionizing teacher, along with his followers engaged in preaching around the villages. His scrupulousness as a scholar won him many sympathizers among the oppressed and exploited peasants. He

called for responsible leadership committed to a moral vision of society, not a corrupt one which ruled arbitrarily. As the tensions mounted between Usuman and the king of Gobir, Usuman, whose life was in danger, was forced to disengage from society by moving from Degel to an alternative place (Gudu) to establish a new just society based on his Islamic reformist program. In effect, he and his followers performed a *hijrah*, or migration, following the example of the prophet, a preparatory stage for the *jihād*.

Once open conflict erupted between the king of Gobir and his Muslim protagonists, Usuman declared a *jihād* which, after its initial success, attracted other disaffected groups, including Fulani pastoralists who resented arbitrary seizure of their stocks. These military campaigns, which lasted from 1804 to 1810, engulfed not just the Hausa states, but also western Bornu, Adamawa, Nupe, and the Yoruba state of Ilorin (the basis of Islam's later impressive inroads among the Yoruba in the forest region of Nigeria). The outcome was a sprawling empire or Sokoto caliphate, with a number of separate emirates, which was ruled by a caliph (*Amir al-Muslimin*). Usuman retired into a religious life and left the administration of the new state to his brother and son.

Thus the Muslim scholars were able to realize their vision of creating an Islamic state. The ideals and values of the reformers were never realized although they remained normative and guided Usuman's successors. More importantly, Hausa society became transformed with the state and its institutions became Islamized. Another major outcome was that the Hausa ruling elite were replaced by a new Fulani one that adopted Hausa language and culture. Nevertheless, not all pre-*jihād* structures and practices were eliminated, as evidenced by the continued existence of some communities of non-Muslim Hausa speakers known as Maguzawa.

THE ŠUFĪ ORDERS AND THE NINETEENTH-CENTURY JIHĀDS IN WESTERN SUDAN. Following Shehu Usuman's example, Ahmadu Lobbo conducted a *jihād* in 1818 against Fulani syncretists in Massina on the middle Niger south of Tombouctou. The state that he established, which lasted until 1864, was criticized by the Kunta and even Sokoto leaders for not being free of narrow-minded concerns and bigotry.

The first wave of *jihāds* or religiously inspired revolutions in West Africa were for the most part led by members of the Qadiri order (for instance, Usuman) while the later ones were mainly headed by Tijanis. The most important of these was the one led by al-Hajj 'Umar (1794/97–1864), the Tijani leader in West Africa. His pilgrimage to Mecca and his appointment while there to Tijani leadership in West Africa confirmed him in his reformist mission to challenge syncretic Islam as well as other Šufī orders, including Qādirīyah. He used Islam to forge a large Islamic state incorporating the regions of Segu, Kaarta, and Massina, which make up large parts of the present republic of Mali. His influence spread rapidly, perhaps too rapidly, explaining why he clashed with the French as well as the established groups

in Massina. Despite his death in 1864, his state survived for the next several decades amidst French imperialistic and colonial advances in the region. Further south, on the fringes of the forest zone, during the decade of the 1860s, Samoury Toure (1835/40–1900), a long distance trader, attempted to unite various southern Mande peoples and states into a vast political system.

THE PROGRESS OF ISLAM IN ETHIOPIA AND THE HORN OF AFRICA. The economic, cultural, and political relations between Ethiopia and Arabia, separated only by the Red Sea, predate the coming of Islam by many centuries. In fact, this much earlier contact is evidenced by the presence of the locally evolved Geez, an Afro-Asiatic language, which bears the imprint of the interaction between south Arabians and the local Ethiopian groups. While in the seventh century Muslim refugees had migrated to the Aksum court to escape Meccan persecution, by the eighth century Muslims had settled on the Dahlak Islands off the Ethiopian coast, and by the ninth century there were Muslim communities along the long-distance trade routes into the interior. Islam expanded southwards, from the Harar area, in the direction of the Sidama principalities but not in the north where the Christian power was well established and well entrenched.

The growing power of Ifat and other Muslim states threatened the interests of an expanding Christian kingdom under the Zagwe kings who controlled the Ethiopian highland region. By the early fourteenth century, however, Ifat had been defeated. Yet, another Muslim state, Adal, asserted itself and began to recruit support from the Somali pastoralists who were increasingly being proselytized. More importantly, Adal controlled Harar, the most important center of trade and Islam in the interior, and also Zeila, on the Somali coast, south of modern Djibouti, which by the end of the ninth century had become a significant alternative Muslim trading settlement. Somali coastal settlements developed into thriving towns, the most significant of which was the sultanate of Mogadishu.

At the end of the fifteenth century or early sixteenth century, a Muslim general, Ahmad Gran, became the ruler of Adal and took on the title of *imām*. He saw Christian Ethiopia, then ruled by the Solomonid dynasty, as a threat to Muslim security. He articulated his policy toward Christian Ethiopia, which showed signs of breaking up, in religious terms and went on to overrun major sections of it with Ottoman-supplied firearms. The timely intervention by a Portuguese force, which came to the aid of Ethiopia, led to the two forces together defeating and killing Ahmad Gran in 1543 and thus saving the kingdom.

In the sixteenth century the pastoral Oromo, from northeast of Lake Turkana, moved into the southern highlands of Ethiopia, a region destabilized by the warfare, and pushed as far east as the plateau of Harar. Those that came into contact with Adal Muslims converted to Islam while others elsewhere became Christians. The Oromo became a major factor in the expansion of Islam from the eighteenth

century onwards. Today they form the largest ethnic group in Ethiopia with probably more than half being Muslim.

ISLAM IN EAST AFRICA AND THE INTERLACUSTRINE/CENTRAL REGION. For centuries, even before the advent of Islam, there had always been contact between the East African coast and western Asia. Traders from south Arabia, the Persian Gulf, and western India took advantage of the monsoon winds to visit East Africa in pursuit of commercial opportunities.

The advent of Islam in Arabia in the seventh century marked the turning point in the trading relations between the two regions. The eastern Bantu speakers had already expanded to this coastal area probably by the midpoint of the first millennium CE, if not earlier. However, the growing commerce between Arabia and East Africa led to an increased migration to the area. The migrants appear to have come from a number of areas, but mainly from southern and, to a lesser extent, eastern Arabia. They first settled on the Benadir (Somali) coast in the ninth and tenth centuries, setting up settlements in Merca, Mogadishu, and Barawa. In later centuries, most notably the twelfth, traders from this region—Africans and proto-Swahili speakers, including probably some African-Arabs—also moved southward along the coast as far as Kilwa and established their settlements there. This is the period of the Shirazi myths as found in a number of chronicles. More immigrants from Hadhramawt and Yemen followed later, although their numbers were much smaller in relation to the local African coastal urban population. The cumulative result of the gradual changes brought about by the interaction between the immigrants and the dominant African Bantu-speaking groups was the creation of a new urban ethos in which Islam blended with the indigenous local culture to produce Swahili Islam. Although the coastal area had not become fully Islamized by this time, by early 1330s when Ibn Batuta visited East Africa, he indicated that there were many Muslims to be found in the thriving coastal towns such as Kilwa, whose inhabitants he makes clear were of dark skin. Swahili culture and language were by then fully evolved that he could speak of the coast as Sawahil country. It took another century or two, however, before Islam became part of the Swahili identity.

There was a period when the founding of Swahili coastal towns was attributed to Asian and Middle Eastern colonizers. This is the Asian perspective or hypothesis popularized by colonial scholarship which denied Africans with a contribution in the evolution of historical towns in their own region. The overwhelming evidence from records of earlier travelers and geographers, recent archaeological findings, and linguistic studies are all, however, in favor of the African perspective, crediting Africans with establishing their own towns. This does not deny the fact that Middle Eastern Muslim immigrants, whether as refugees from the Middle East or attracted by commercial opportunities in the region, were absorbed into Swahili population over a long period of history as evidenced by the culture of the Swahili which is both Muslim and African.

Although Islam reached East and West Africa around the same time, the methods and timing of its diffusion in the two regions presents some interesting contrasts. To begin with, Islam in West Africa had penetrated inland from Sahel into the savanna and as far as the fringes of the forest by the end of the fifteenth century. In East Africa, on the other hand, Islam remained confined to the coastal area for a long time before it was introduced into the interior, for instance, in Buganda in 1840. The spread of Islam in West Africa, moreover, was not associated with one particular ethnic or linguistic grouping the way it was in East Africa. For the most part, Islamization in East Africa went hand in hand with Swahilization, a process by which members of different ethnic groups became integrated into the Muslim Swahili community. In fact, the introduction of Islam in the hinterland of East Africa is closely connected to the extension of Muslim trading communities along the coast as far as northern Mozambique to the Interlacustrine region (which includes present Buganda/southern Uganda, Rwanda, Burundi, eastern Congo, and Malawi). Another significant difference is that religious upheavals in East Africa did not play a role as an instrument of conversion the way they did in some areas of West Africa. This means that there was no territorial expansion of Islam from the coast to the interior. There was a marked absence of empires like those of Ghana, Mali, and Songhai; instead, East Africa produced several dozen trading city states at the height of its commercial prosperity by the fifteenth century. Also, whereas East Africa was incorporated into the world of the west Indian Ocean, West Africa, through the trans-Saharan trade, was more connected to North Africa with which it traded for a long time.

The coming of the Portuguese to coastal East Africa at the end of the fifteenth century, as crusaders with commercial interests in the East, disrupted the Indian Ocean trade and also put to an end the first Muslim period of the East African coast. The brutal rule of the Portuguese provoked rebellions from time to time, and by the end of the seventeenth century, the Portuguese had been expelled from the coastal area north of Mozambique through a combination of local resistance and the rising power of Oman. Omani influence did not take hold until the 1830s when the sultan of Oman moved his capital to Zanzibar. This was a period of a commercial revival, including an expansion in slave trade, as well as growth in higher Islamic education along the coastal region and the development of the Ibadi school of thought in East Africa. Additionally, during the colonial period, Muslim communities from the subcontinent, Sunnī and Shīʿah, migrated to East Africa, adding a cosmopolitan dimension to the presence of Islam there.

ISLAM IN SOUTH AFRICA. The highly urbanized Muslim minority communities of South Africa, with people of mainly Malay and Indian descent, have their origins in the developments starting from the mid-seventeenth century. As the Dutch began colonizing the Indonesian archipelago, the Cape of Good Hope functioned as a convenient place of exile for Indonesian political leaders. These exiles included Mus-

lim learned men such as the scholar saint Shaykh Yusuf. A revered figure and a leader of an alternative culture, Shaykh Yusuf led foreign, non-white members of excluded or isolated groups who maintained their Islamic faith and perpetuated it among the slaves, convicts, and freed convicts from India and the Indonesian archipelago. Given the racial attitudes of nineteenth-century white South African society, many African slaves (liberated “Prize Negroes” or Africans freed by the British from intercepted slave ships) who could not be assimilated into white Christian culture found themselves turning to Islam. The final phase of Islam’s entrenchment in South Africa through immigration came with the introduction of indentured labor service from India for the sugarcane fields in Natal. A significant number of these foreign workers were Muslim and succeeded in establishing a base for the faith in the region. Over a century later, Islam had survived in South Africa and even entered into a radical phase among some of its followers during the period of apartheid. The location of the South African Muslim communities on the periphery of the Muslim world in a secular Westernized world has allowed for some of its scholars to offer interesting modernist interpretations of Islam that are in keeping with progressive trends.

ISLAMIC ART AND ARCHITECTURE. Treatment of the diffusion of Islam in Africa from both the east and the north would be remiss if the cultural dynamics of the interaction between the Islamic system and values and those of traditional African ways of thinking, especially in the area of visual representation, were not present or discussed at least briefly. The question that first needs to be asked is whether the old forms and symbols of the indigenous African system were discarded as a result of the encounters between Islam and traditional African religions? Did Islam, with its supra-ethnic universality, and the local African culture, with its ethnically centered identity, blend sufficiently during the process of Islamization on the continent to produce an Islamic art in Africa?

In the artistic and architectural domains there was a unique blending of Islamic structure and African representation. Once a balance had been reached between the local religious practices and the universal ritual prescriptions of Islam, the next step was to cast the imagery and iconography of African ancestral pillars, shrines, and so on into Islamized form. Where Islam was introduced, such items as charms, amulets, certain types of clothing, and prestige goods were incorporated into local societies. More importantly, the local altar-shrine was transformed into the mosque in such a way that the physical configuration represented a leap into verticality. Thus, the single, towering pyramidal earthen cone became the *mihṛāb*, while also serving as a minaret, with its system of projecting wooden pickets extending out of this massive structure. The ends of these wooden pickets served as a scaffold for workers to climb and repair the walls. The ancestral conical structure or pillar (in the Voltaic tradition) was now redirected to a new focal center, that of Mecca. In certain cases, as Prussin and Bravmann have observed, some of the

mosques that were built in Mali had *mihṛābs* that evoked the image of an African mask, which traditionally represent powerful forces. This is how the mosques were constructed by the Mande of West Africa with Islam clearly inspiring the use of certain architectural features in the spatial configuration. The Islamic architectural tradition, mediated through the Maghrebian heritage, in turn inspired the architectural imagery or style represented by the thatched domes of the Senegal-Guinea mosques and maraboutic shrines, following the example of the domed cities of Tripoli and Cairo.

Islamic-type designs were also emulated and led to the adoption of arabesque wall patterning instead of the attached African charms. This calligraphy allowed for a new system of spatial organization. More than this, Islamic script was used in decorative ways even in non-Muslim areas such as modern-day Ghana, where in the nineteenth century, the Asantehene, head of the Ashanti confederacy, wore clothes with Arabic writing in various colors. Islam had clearly filtered through Ashanti politico-religious structure such that, as one scholar has noted, both in terms of ideas and in the realm of the arts, it provided a medium through which the ideology of the Ashanti was communicated.

CULTURAL DYNAMICS. Islam, which for many centuries coexisted well with traditional African religion, gradually over time attempted to replace it as the dominant faith of some regions. What made this possible was that the Islamic faith was much more adaptable in Africa, with minimum requirements for new members, including at the very least a change of name after reciting the testimony of faith. The observance of Islamic duties along with the understanding of the faith were supposed to follow later. For the first generation of Muslims, introduction to Islamic cultural values was what came first whereas Islamization itself could take generations to realize. At this level, there was accommodation to social and political structures of authority. This was the period when the learned Muslims, as in West African kingdoms, played a key role in administration and diplomacy. Eventually, however, a number of these African rulers adopted Islam and in doing so may partly have undermined the basis of their legitimacy as guardians of African ancestral religious traditions. Nevertheless, they did not completely renounce ties with the African traditional religion, which continued to be the religion of many of their subjects. This arrangement assisted in maintaining order although it did not please some West African *Ṣūfī* leaders of the eighteenth and nineteenth centuries who launched their *jihāds* and reform movements of Islamic revivalism, some of which had *mahdī* and messianic overtones, to establish Islamic states.

ISLAM DURING THE COLONIAL PERIOD. While there were some Muslim leaders who resisted colonialism—such as Muḥammad ibn ‘Abd Allāh (1864–1920) of the Salihiyah order in Somalia, al-Hajj ‘mar, and Samori (Guinea and Mali)—many others chose accommodation and collaboration. Colonialism facilitated the growth of Islam in areas of Africa as far apart as Tanzania (Tanganyika) in East Africa

and Senegal in West Africa through the activities of Muslim brotherhoods (Sūfī orders), traders, and others. For some African groups, the loss of power with the onset of colonial rule made them gravitate towards Islam which was seen as an alternative to the prevailing colonial order. The difficulties of a new life under the colonial system, which uprooted the African from his or her traditional universe, presented Islam with an opportunity to provide a new framework as meaningful and all-embracing as the old African one. This, for instance, happened with Amadou Bamba's Murid brotherhood in Senegal, which converted thousands of people whose earthly kingdoms had been destroyed by colonialism. In 1888 Bamba established Touba/Tubaa as a great holy city, some claim it to rival Mecca, where he was buried in 1927. Every year hundreds of thousands of his followers visit his tomb on the anniversary of his death. Generally speaking, for the uprooted African who joined the faith, the Muslim supra-ethnic *ummah* provided solidarity and a sense of belonging not very different from that of the African village or ethnic one. Moreover, while the Islamic prescriptions replaced the indigenous ones, in matters of worship, however, the Muslim ritual prayer did not completely dislodge the traditional rituals of seeking to appease one's ancestors. In fact, Muslim religious leaders and teachers performed, in some cases, the same kind of role as the African healers and medicine men in carving out the domain of popular religion.

Islam therefore spread rapidly during the colonial period and became the majority faith in Senegal, Gambia, Guinea, Mali, Niger, and northern Nigeria where Shehu Usman's descendants continued to exercise influence. Islam also made progress in areas such as Burkina Faso, the northern parts of the Ivory Coast, Ghana, Togo, Benin, and the "middle belt" of Nigeria where twenty to forty percent of the population is Muslim. Were it not for the resilience of traditional religions and the activities of Christian missions, Islam would most likely have been a majority religion here too.

POPULAR ISLAM IN AFRICA. Despite Muslim efforts to purge African elements from their faith, Islam continued to display a level of indigenization or Africanization in West Africa. In spite of producing such well-known major religious Fulani reformers of the nineteenth century, including Shehu Usman dan Fodio, in northern Nigeria, women still tend to follow the traditional cults, including the bori spirit cult, even with the sustained impact of Islam in Hausaland for centuries. According to some scholars, there must be a level of affinity between the two religious systems which allows this to happen. For instance, the belief in mystical powers (*jinn* or invisible supernatural creatures) allows Islam to be accommodated to the African spirit world, which is important to understanding the African religious universe. In fact, the ancestral beliefs have been recombined with Muslim practice to form a new "folk" religion with emphasis on saint veneration, which popular Islam and Sufism reinforce and which approximates local ancestor veneration.

The diagnosis and treatment of illnesses attributed to occult forces in Africa have provided an opportunity for

Muslim healing traditions to flourish and allowed for the services of Muslim healers and holy men, who provided additional healing choices to local practitioners, to be in high demand. The appearance of new epidemic diseases such as smallpox and cholera, which arose in the nineteenth and twentieth centuries in hinterland East Africa and which the local people could not adequately deal with, led people to turn to the Muslim healing system. Muslim prayers and amulets were more popular than Muslim secular remedies in this atmosphere of suspicion, which took the form of sorcery and witchcraft accusations. As has been noted, apart from the fact that Muslim amulets were believed to embody the words of the Supreme Being and not that of the intermediary powers, making them therefore more portent as the Ashanti believed, Muslim literacy played a role as a potential source of healing. Furthermore, Sūfī masters who had attained a closeness to God through following the path of spiritual enlightenment were believed to have special powers which made their prayers efficacious. This *barakah*, or blessing power which heals, was passed on in families and explains why the scholarly Sūfī lineages of the Sahara have played a pivotal role in mediating Islam between North and West Africa.

Modern developments in the Muslim world have undermined, to some extent, the influence of the *ṭarīqah* (Sūfī orders) in some parts of Africa such as Tanzania. Yet, the commitment to a mystical engagement with faith continues to be strong in West Africa and especially in Senegal, although even there it is facing the challenge of the Salafī reformers, also known as Wahhābīs, a term that is not used approvingly. Sufism, far from being a predominantly rural phenomenon which would fade away as Muslim societies became increasingly modernized, has continued to thrive and to engage African Muslims of the urban centers as well. It is true to say though that for some educated young African Muslims who are discomfited by magical practices, saint veneration, hierarchy, and authoritarianism of some Sūfī orders, the Salafī message has proved attractive.

The Salafī religious revivalism, despite its attractiveness to younger Africans, is generally conservative and traditional; to the extent that this is true, Salafī reform and Sūfī traditionalism are constantly engaged in an overlapping movement of interaction. Will they creatively synthesize from the values of their common Islamic heritage while acknowledging the entanglements and creative encounters between and within cultures? It remains to be seen what the outcome of this clash will be. It is clear though that underlying the conflict between them are struggles for power and control of the Muslim community in places as far apart as Uganda, Nigeria, and Mali.

WOMEN AND ISLAM. With respect to gender issues, Islam did not introduce patriarchy to Africa. In fact, many African societies were patriarchal and polygamous even before their encounter with Islam. Nevertheless, where Islam was introduced and its values incorporated in the socioeconomic and political structures of these societies (especially those with a

propensity for state or empire building), a hierarchical social organization resulted in which there were clear demarcations of male and female spheres of activity. This, of course, did vary from society to society. For instance, the Yoruba women of southwestern Nigeria continued to be market women even after the coming of Islam whereas their Hausa counterparts in northern Nigeria tended to lead more secluded lives. It is significant to note that the Mahdiyya movement, which was established in 1941 in southern Nigeria by the scholar Muḥammad Jumāt Imam, emphasized the education of women, their attendance of mosques together with men, and their inclusion in public affairs. By way of comparison, among the Tuareg-Berbers of the Sahara, who tend to be matriarchal, their unveiled women continued to enjoy far more freedom of movement than their Arab counterparts in North Africa.

Mysticism, and its chant practices and the spirit possession cults, provided an opening or opportunity for the acceptance of female authority, for instance, Sokna Magat Diop of the Murids, or religious leadership located within the female realm. Moreover, the Qādirīyah order did not challenge the female leadership of Shaykh Binti Mtumwa, a former slave or person of low status, who founded a branch of the order in Malawi and was successful in attracting many women. Therefore, both possession cults and Ṣūfī brotherhoods have allowed women to establish a sphere of action in hierarchical societies where control of the state is a male domain. These orders have incorporated women in both East and West Africa, especially in the area of education and fund raising, although women have a much larger scope in Senegal than Nigeria in brotherhood leadership.

There are Muslim women who, during the period of economic hardship at the end of the twentieth and beginning of the twenty-first centuries, have begun to articulate issues of cultural authenticity rooted in Islamic identity in opposition to what has been perceived as Western cultural domination. They reject Western feminism, which they see as an extension of Western cultural domination and which sets Western values and ideas as the normative values. The role of these women has expanded as liberalization of the political process and the emergence of multi-party politics have led them to establish organizations and to embrace a particular agenda, including the Muslim dress code, and become involved in cultural politics. The Islamists and radical reformist activists are engaged in contesting existing gender relations and social justice. Islamists use the text (scripture) as their framework, whereas the secular activists' frame of reference is based on certain abstract concepts such as egalitarianism, humanism, human rights, and pluralism, concepts which have emerged from Western discourses on the subject.

The above examples indicate that the roles of men and women are constantly changing, especially due to urbanization, education, and cross-cultural contacts. For some women these changes have generated new freedom and opportunities for self-improvement.

ISLAMIC LAW IN AFRICA. In the political domain, Islam united much of Africa in the past and was willing to accommodate local, including legal, practices. Nevertheless, as the level of Islamization deepened, learned Muslim scholars began to call for a strict interpretation of the *sharī'ah* or Islamic law which they saw as different from the African legal and customary practices. Some obvious areas of difference included, for instance, the emphasis on individual ownership of land (and property inheritance through the male side of the family), whereas in various African societies land belonged to the community. Also, some have suggested, the way Islamic law was interpreted tended to give men more power over property matters than perhaps was the case in some African societies. Yet, comparative data across a number of African societies is needed to make this a meaningful comparison.

Unlike its African counterpart which is customary and unwritten, Islamic law, which covers both public and private life, is written, providing an extensive institutional framework within which Muslim *qādī* analyze legal issues and deduce new laws to handle new situations in the *ummah*. Its emphasis is on the rights or obligations of individuals, whereas African customary law (in which economic and social relations, especially in "stateless" societies, were regulated by customs maintained by social pressure and the authority of elders) is based on kinship ties in matters of marriage and property. It extends to commercial and criminal law and also has rules regarding the conduct of political leaders or those entrusted with authority. In their encounter with other legal systems, European colonial powers left these systems functioning in some societies (for instance, in Sudan and Nigeria as part of the British self-serving policy of indirect rule) while in others they allowed Muslim judges to apply Islamic civil and family law, except in criminal matters, which were tried by European courts. In the post-colonial period, the scope of Islamic law, where it is applied, is limited to religious issues and civil cases as the modern trend, with its emphasis on equal rights of citizens, is to have laws that apply across the board without recognizing any distinctions based on religion or gender.

The decision to recognize or not recognize Islamic laws in many African states after independence has created tensions and political controversy, especially when the secular elites have sought to forge a uniform system of law or at least have attempted to modify Muslim personal law, in aspects such as marriage for girls, to bring it in line with the inherited Western law and African customary practices. There has been a wide variety of responses to this dilemma regarding how much scope to give to religious laws. Mozambique, for instance, has made attempts to recognize traditional and religious marriages (thus doing the basic minimum) whereas Sudan has made *sharī'ah* the law of the state. The call by Muslim groups in northern Nigeria for nationalization of Islamic law has unleashed the *sharī'ah* debate, a source of tension in national politics in a country where at the very least only half or slightly more than half the population is Mus-

lim. In African Muslim societies in general, however, it has been noted that there is often an anti-state discourse underlying the call for Islamic law by Muslim groups. These groups seek to foster their religious and cultural autonomy in societies where the state and secular institutions have neglected to respond to their needs.

ISLAMIZATION OF AFRICAN LANGUAGES. Arabic as the language of Islam has provided abstract concepts, particularly religious ones, which reveal Islamic modes of thought and expression. Islamic influence is, in fact, revealed both at the explicit and suggestive levels in languages as different as the Berber dialects, Hausa, Fulani, Mandingo, Swahili, and Somali, to name just a few. These languages have absorbed the Islamic worldview, though at some level languages such as Swahili have been progressively secularized over time, during and after the colonial period, making them more neutral. Since the eighteenth century, religious poems, sermons, devotional prayers, and litanies have been committed to writing in some of these Muslim languages of Africa, and legal manuals have been translated from Arabic to these languages.

The written word has been held in such high esteem in Islamic culture that wherever Islam has reached in Africa versions of its script have been adopted in those regions of sustained contact. Moreover, Islamic penetration of Africa introduced Arabic as the language of religious discourse among scholars, official correspondence between Islamized states, and historical writing during the period of the Muslim kingdoms. The priceless Tombouctou Arabic manuscripts, which still survive though precariously, once fully studied and analyzed by scholars will likely demolish the conventional historical view of Africa as a purely “oral continent.” Both East and West Africa have also produced Afro-Islamic literature, from the panegyrics of the Prophet to poetry, based on local languages that have absorbed many Arabic words in the spheres of religion, politics, and commerce. In some of these areas, the written word though has competed with the oral literature, especially among such clan-based people as the Somali.

FUTURE OF ISLAM IN AFRICA. In the twenty-first century’s era of globalization, Islam in Africa will continue to oscillate between accommodation and reform (both internally and externally generated), particularism and universalism, quietism and political activism, although increasingly the latter is the case in a significant number of countries in this era of Islamic resurgence worldwide. Islam has sought to penetrate Western secular cultures whose institutions and ideologies have not functioned well in Africa. In Muslim northern Nigeria, for instance, the *shari’ah* debate is seen by some as masking concerns with Nigeria’s federal system and is taking the form of cultural self-determination, cultural insecurity (in the wake of Western-driven globalization), and as a political-bargaining strategy for a region that thinks it is losing influence. Similarly, in Uganda in the 1990s, the increasing radicalization of Muslim Salafi and reformist groups, revealing social-economic forces at play and issues of inclusion or “full-

citizenship,” was partly a response to what was perceived as the failure of national institutions to provide social services.

BIBLIOGRAPHY

By far the single most important volume to date on the history of the development of Islam in Africa is *The History of Islam in Africa*, edited by Randall Pouwels and Nehemia Levtzion, (Athens, 2000). This will no doubt remain the definitive study on the subject for some time. Earlier works, though dated, that laid the foundations of serious study of Islam in sub-Saharan Africa include those by J. Spencer Trimingham, *Islam in the Sudan* (Oxford, 1959), *Islam in Ethiopia* (Oxford, 1952), *Islam in West Africa* (Oxford, 1959), *A History of Islam in West Africa* (Oxford, 1962), and *Islam in East Africa* (Oxford, 1964). For broad historical outlines of the regions where Islam spread, consult the relevant sections in *The Cambridge History of Africa*, eight volumes, (London, 1975). Other useful texts include Peter Clark’s *West Africa and Islam* (London, 1982) and *Islam in Tropical Africa*, second edition, edited by I. M. Lewis (Oxford, 1980).

The Institute for the Study of Islamic Thought in Africa (ISITA) at Northwestern University has produced a series of important publications, such as “Arabic Literature of Africa,” in a projected six volume series, of which the first four have already appeared. They include Volume 1: *The Writings of Eastern Sudanic Africa to c. 1900*, edited by R. S. O’Fahey, (Leiden, 1994) and Volume 2: *The Writings of Central Sudanic Africa to c. 1900*, edited by John Hunwick, (Leiden, 1996). The proceedings of the yearly ISITA colloquia have also produced *The Transmission of Knowledge in Islamic Africa*, edited by Scott Reese, (Leiden, 2004).
