

My Experience and My Guess of the Operator about the Communication Relay:

Brief Summary: Since middle of 1999 about for 5 years, I felt I was watched (monitored) by someone, somewhere, by a candid camera. Finally, bingo! Perhaps, I found the camera above the sky, on the satellites. Besides, perhaps, I reached my newest elucidation of their communication relay techniques via satellites: reading inside of my brain's both language-areas and image-areas. They appear to be projected to a possible operator, National Reconnaissance Office. Due to somehow dangerous nature of this technique, it should be tightly regulated by the congress. (Revised, December 23, 2005)

Quick Glance of Communication Relay:

- Everything you can see in your brain from sights to dream is viewable at the side of communication relay operator.
- Everything you can hear in your brain is also listenable at the side of communication relay operator; thus, this is easier and accurate than wiretapping.
- It took years until I became aware about those two aspects of reading my brain above. Until something will happen to you, you may not be convinced.
- Whispering from the operator to my brain is almost always disguised as if neighbor's talk or radio/TV noise in the next room. It took also for years until I became aware about the source of voices. And in the worst case it may turn into torturous nature, such as 24-hours/7-days and annoying topics. Since the content is personal subjects, I see it is the sophisticated image-voice simultaneous communication relay.
- Whispering is close to influencing, and there is no way to turn it off. It appears to be used to many people.

History of Search about Hidden Camera : Since the middle of 2000, I have been intensively looking for the hidden camera, both at my room and in my car. At first, I assumed a tiny camera was equipped around me. I have found none. Then, I tested outside, parks, mountains, sea-shores, and in the buildings, where the camera couldn't be followed easily, such as Malibu-cliff, Malibu-mountains, and weekend empty college rooms. I assumed that I was monitored by electromagnetic waves (photons) like radio-TV waves, and gradually I am getting convinced. The source of electromagnetic waves could be two possibilities: the ground-based radiator like a regular radio-TV, or the satellites. Based on the hint of no attenuation of monitoring during my car traveling, and the hint of no blockage of physical barrier, mountains, etc., I am inclining to the satellite-method.

Direct Brain Talking with likely National Reconnaissance Office (NRO) : Since spring of year 2005, it became evident that someone was talking directly to me. Again, I looked for the tiny radio devices equipped at my room, in my car, and outsides. I have found none. Then, at the special occasion at August 2005, the talk became 24 hours (**up to now over four months**), and it told me a lot of hints. The summary of their hints and my experience are,

- Developed by an agency founded in 1947;
- Voice perception happens near the pineal gland in the brain;
- The sights through my eyes are transmitted to their monitor simultaneously, therefore, the whisperers can talk (personal-casting) to me as they are looking at my vision images;
- Communications with NRO's announcers are completely interactive, without uttering voices, just thinking in the brain is enough;
- Communications can be possible like a live voice conference with multiple participants (focus-casters) if NRO's switch board arranges it.

MY EXPERIENCE :

Since the last August, I figured a lot of features of this communication relay, and reached my own elucidation.

- In my case, the announcers' voices are nearly 100% in Japanese, by one man and one lady. Then I reminded that the thinking in my brain is mostly in Japanese. Only when I talk and write, I do in English. Occasional switch of my brain to Spanish, Portuguese, has no problem to NRO. This suggested full interpreter staffs (or software) of languages at the agency. The announcements are usually about what is thinking by whom. Usually my friend's name is called at first, then followed by their thinking or feeling are announced.
- Voices of my parents, my sister and my brother-in-law in Japan reach in my brain, and they appear the recorded voices. The 17 hours GEO-time-lag can be ignored (during their sleeping time, they are speaking). Therefore, I concluded that the voice responses heard in my brain are the mixture of truth-and-lie, the mixture of live and recorded, for example, 70 % truth, 30 % false, just the convenience of NRO's switch-board and announcers. This is a problem!
- Thinking transmissions (before speaking in voice) to other persons are also very serious problem!!! So many accidents could happen by the NRO's careless communication relay. It is better rely on the regular voice-talk communications; telephone, cellular-phone, and face-to-face.
- Voices reaching in my brain appear to be controlled at volume, at distances. For example, some voices are in the center of my brain, while the other voices are as if a few yards away. At first I assumed the different techniques are used, but now I assume the brain's perception mechanism of distance is used. All voices (any angle, any distance) reach directly into my brains with distance perception mechanism, bypassing the ears. The voices are often disguised as if they come from the neighbors, but likely no person is there. The voices in the center of brain are confused with my own thinking, so this is another problem!!
- The announcement occasionally contain background music, instrumental sounds, a big "Bingo" sounds, and the volumes are adjustable from very low to loud up to a speaking level. Usually, almost at the verge of low, just audible.
- This electromagnetic wave appears to be a focus-casting, that is like a laser beam of electromagnetic wave, which is hitting a person's brain from a satellite. Thus, none of the neighbors are usually disturbed. No air vibration. It reaches me when I am even in the deep ground in the Metro train. The moving object is easily snapped and chased by a moving device's angle with the software, for example like a cellular phone's Global Positioning Service.

Over all, I recognize a few dangerous features on this satellite communication relay.
