SGIconsole™ Software CD Information Card

IMPORTANT: Your SGIconsole machine probably arrived with the Red Hat 6.2 base Linux distribution and the SGIconsole 1.1 software preinstalled on it. If you are uncertain whether SGIconsole 1.1 has been preinstalled on your machine, you can run the following command to verify the software:

```
rpm -qa | egrep "SGIconsole|pcp|vacm" | sort
```

If SGIconsole is already installed, the output from this command will list the SGIconsole, PCP, and VACM packages. You can begin using the SGIconsole system as described in the book *SGIconsole 1.1 Start Here*.

Should you need to install SGIconsole 1.1 from the CD, it is recommended that you do a clean installation, following the instructions in *SGIconsole 1.1 Start Here*.

Note: The SGIconsole reinstallation procedure is the same as the installation procedure after you have removed the SGIconsole rpms.
